cally hopeless. Every Conservative, as well as every Liberal, knows that a Land Bill of some kind is under the circumstances a necessity, and the enormous majority of Liberals have given Mr. GLADSTONE a power of attorney to dispose as he likes of their understandings, their consciences, and above all their votes. That the House of Lords would be fully justified in throwing out the Bill, and thus demanding that the sense of the country should be taken on it is indeed undeniable, or can only be denied by persons equally ignorant of history and of the Constitution. That it would be wise for them to do so, or even to stickle for any considerable alteration in the landlords' interest, does not by any means follow. The flicker of independence which showed itself in the Lower House last month has burnt itself out. The thermometer, or the Birmingham National Federation, or both combined, have cowed the spirits of the Ministerialists, and the Opposition are powerless alone. There is little reason to believe that the Bill will go up to the Lords with that record of dwindling majorities against it which even Mr. FAWCETT pronounces to be sufficient to justify rejection. Nor, although its provisions are in many cases eminently unwise, and in some demonstrably unjust, can it be said that there is, on the whole, such a great political principle involved that it is worth while for the Peers to throw away the scabbard. Although the arguments used to support it are directly inconsistent with those used to support the Act of 1870, it is, in a sense, a development and consequence of that Act. Moreover, unlike measures which make one clear, definite, and unmistakable change, its provisions are of so minute a nature, and their effect depends so much on conditions which it is impossible to estimate, that the responsibility of it may fairly be left to the party and the Ministry which have produced it. As it stands at present, although a few of its worst details have been removed, it is not open to any one to say, as has been said of the Act of 1870, that it has been mutilated and spoiled. The harm and the good of it both will be harm and good wholly and solely chargeable to Mr. GLADSTONE'S Government, and to his present Parliamentary majority. In the direction of limiting the range of its operation something might be done; but minute amendment would probably prove as futile as it would be unwise.

#### THE NEWFOUNDLAND DIFFICULTY.

THE inadmissible claims of French authorities to the sovereignty of a part of the coast of Newfoundland will, perhaps, be withdrawn or modified in deference to the remonstrances which the English Government has probably by this time preferred. The troublesome activity of a French official may possibly have been stimulated by the promotion of M. ROUSTAN. The author of the quarrel with the Bey of TUNIS has been rewarded by advancement to the rank of Resident Minister, and by the virtual administration of sovereign power. It is not surprising that civil and military servants of the Republic should be tempted to emulate an activity which has been so greatly profitable. They may also have contrasted the turbulent energy which they attribute to their own superiors with the avowed policy of the English Government. The retreat from Candahar, though it may have been in itself advisable, has, in combination with the rapid progress of Russian conquest, been open to misinterpretation. The surrender of the Transvaal after defeat has confirmed the impression that the frontiers of the English Empire will be withdrawn wherever they are threatened; and in Newfoundland itself the payment of damages to the United States, in the absence of any corresponding concession on the other side, may have misled French functionaries into the belief that the English Government was on all occasions prepared to yield to sufficient pressure. It is in the highest degree improbable that the French Government should deliberately provoke a rupture with England; and the best mode of maintaining friendly relations is to insist peremptorily and firmly on the recognition of indisputable rights. The French Republic ought not to imitate the restless policy which indeed was during the Second Empire, from the failure of the Mexican enterprise to the beginning of the German war, confined to words. Within a few weeks the Government has contrived to alienate the good will of Italy and of Spain, and to render possible a collision with Turkey. English feeling has not

been conciliated either by the events of Tunis or by the difficulties which threaten the negotiation of a commercial treaty. Encroachments on the territory of Newfoundland would produce serious resentment.

The present dispute furnishes an historical illustration of the occasional dangers which may result from excessive desire of conciliation. It was natural that Newfoundland, situated in the Gulf of St. Lawrence, of which both shores belonged to France, should be claimed by the Power which owned Acadia, notwithstanding the occupation of the island in the name of Queen ELIZABETH. By the Treaty of Utrecht Louis XIV., then reduced to the lowest stage of depression, abandoned his pretensions to the sovereignty of Newfoundland; and in all the subsequent renewals of the treaty the same territorial arrangement has been continued. Unluckily HARLEY and ST. JOHN were in as great a hurry to come to terms with a defeated enemy as if they had been Manchester or Birmingham politicians of the present day. They consequently allowed the French to retain a right of fishing on the coast of Newfoundland, with certain easements on the shore for the purpose of drying their nets and curing their fish. It may be said in excuse of the English plenipotentiaries that the island was at that time thinly inhabited, and that the fishery was probably in the hands of French Canadians from the mainland. The inconvenience of conferring on foreigners limited rights which they will always try to extend has been once more shown in the results of the Treaty of Washington, which was concluded in the same spirit as was the Treaty of Utrecht. Fifty years later an opportunity occurred of rectifying the error which had been committed. By the conquest and subsequent cession of Canada, the fishermen whose rights had been reserved at Utrecht became subjects of the English Crown, and therefore no longer needed special privileges in Newfoundland. Shortly before the close of the war attention had been called to the question by the insolent demands of the Spanish Government, which had recently concluded the Family Compact with France. In addition to other propitious claims advanced for the express purpose of provoking a quarrel, Spain insisted on a right to share in the Newfoundland fisheries. PITT replied, as might have been expected, that he would as soon admit the Spaniards to the Tower of London. As he had determined to retain Canada, he had no occasion to consider the French rights which had been appended to the possession of the colony. One of the most lamentable transactions in English history caused, among other results, the present Newfoundland difficulty. In concert with GEORGE III., Lord BUTE was already intriguing against PITT, who resigned his office on the refusal of the Council to declare war with Spain. On his retirement, negotiations with France were immediately instituted, and they were conducted in the spirit which had prevailed half a century before at Utrecht, and which was still more conspicuously exhibited a century afterwards at Washington.

The Duke of BEDFORD, who was sent to Paris as chief Plenipotentiary, outdid the KING and Lord BUTE himself in humble complaisance. The Duke of CHOISEUL, then Prime Minister of France, proposed that the islands of Grand Miquelon, Petite Miquelon, and St. Pierre, on the coast of Newfoundland, should remain in possession of France, as stations from which French fishermen might pursue their industry in the neighbouring waters. Not only PITT, but any Englishman of ordinary spirit and patriotism, would have returned the same answer which had already been given to Spain. There had been a show of equity in reserving the rights of Canadian fishermen. The cession or restitution of the islands naturally belonging to Newfoundland gratuitously conferred on the French a new territorial basis. The Duke of BEDFORD understood so well the audacity of CHOISEUL'S unreasonable demand that he long affected or felt reluctance to the cession. At last he quoted the servile phrase of a French courtier, who was at least flattering his own sovereign, to the effect that his head was at stake, but he would risk his head to serve the King. From his own KING, who wanted peace at any price, the DUKE was, as he well knew, in no danger of even verbal disapproval. From that time to the present the French have occupied settlements off the coast of the island, from which they now seek to extend their sovereignty to a part of Newfoundland itself. No change was effected in their position by the Treaty of Paris in 1783. At the Peace of Amiens England was not in a position to claim any portion of territory which had

belonged to France before the revolutionary war. The Peace of Paris, concluded in 1814 on the fall of NAPOLEON, was founded on the principle that the restored French monarchy was to be replaced in the territorial condition which it had occupied in 1792. Lord CASTLEREAGH, though he was neither a ST. JOHN nor a BUTE, leaned to the side of moderation; and perhaps it was not to be expected that he should make an exception to the general rule of national self-abnegation in the case of Miquelon and St. Pierre. If any English statesman of the time remembered the Newfoundland arrangement, he may have reflected that, in case of war, the naval superiority of England, which was then undisputed, would ensure the easy conquest of a petty French settlement.

It is well that the rights of both parties are defined by written documents which have been, on the conclusion of every fresh treaty, reconsidered and re-enacted. The title of France to Miquelon and the other islands is as little disputed as the right of the United States to the penalty which was iniquitously assessed at Geneva. The words of the treaty of 1863 are perfectly plain, and so is the text of the Treaty of Utrecht, which recognizes as belonging to the English Crown the undivided sovereignty of Newfoundland. No encroachments of French fishermen or settlers can have extended rights which depend wholly on treaty. If it is true that a French naval officer has prevented the collection of customs duties in a part of Newfoundland, he has struck at the root of the English sovereignty. It was assuredly not intended by the negotiators of the Treaty of Utrecht, or of either of the Treaties of Paris, that the Colonial Government should be compelled to constitute an inland frontier for purposes of taxation, while foreigners held the coast and a strip of adjacent territory in full possession. There is no reason to suppose that English subjects of French descent and language sympathize with the intruders who usurp their rights as well as those of their English neighbours. The defence of the colony is one of the most urgent duties of the Imperial Government. Well-known circumstances have produced an impression that colonial interests are not adequately valued or systematically protected by the Government at home. Neglect of the rights of Newfoundland would be felt in larger dependencies, and especially in the Dominion of Canada. It is not forgotten that the American claim to rights of fishing which would constitute a monopoly in the hands of foreigners has not been abandoned. A submission to the encroachments of French fishermen and naval officers would disturb the loyalty of more than one colony.

#### LORD GRANVILLE ON TUNIS.

EVERY day makes it clearer that there are two kinds of difficulties which France is creating for itself by its inconsiderate Tunis adventure. There are the difficulties inside Tunis and the difficulties outside Tunis; the difficulties of governing an alien and hostile race through a puppet, and the difficulties of maintaining friendly relations with the Powers which in one way or other the French occupation of Tunis affects—that is, Turkey and England in the first line, and Italy and Spain in the second. What has recently taken place in Tunis shows how very serious is the task which France has chosen to take on itself. Sfax has been bombarded and the Arabs have been driven out of it. But it has not been occupied, partly from a fear of pestilence and partly because the town has been so destroyed by its late tenants that scarcely any of it remains to occupy. That the Arabs should have forced the French to bombard a town in the country which the French came to beautify and enrich is, however, a very secondary feature of the rising. What constitutes its primary importance is that the rising is not only against the French but the Bey. The country rejects as its ruler the chief who handed it over to the foreigner. The soldiers of the Bey are leaving his standard, his officials are no longer recognized as having authority, marauders rob and plunder almost to the walls of his palace. There is really no Government of any sort in a large portion of Tunis. In the eyes of those who were lately his loyal, and, after an Arab standard, his peaceful and orderly subjects, the Bey has been dethroned; and the foreigners, although they have made the Bey their creature, have not set up any Government to replace that which they have destroyed. The

result of the French expedition is to have introduced a reign of anarchy. It is out of the question that France should endure this. At any cost it must set up a new Government in Tunis, and the only Government that it can set up is that of France itself. If it pleases, it may keep a Bey shut up in a palace in whose name it issues orders; but the only instruments by which the execution of these orders can be secured are the soldiers of France. There is a profound difference between governing Tunis through the Bey and governing it in his name. The French Government calculated that it would be able to govern Tunis through the Bey. In this calculation it has been entirely disappointed. The Bey has no hold on Tunis of which France can quietly take advantage. It must therefore itself govern; and to the Tunisians it will be a matter of profound indifference whether to the edicts which France issues the name of a discredited French prisoner is appended or not.

The difficulties which the expedition has created in the relations of France with friendly foreign Powers are only gradually revealing themselves. It was not the expedition itself that was the cause of offence; for there was a tacit understanding that, if France chose to go to Tunis, she must be allowed to go. It is the indirect consequences, some of them seemingly very small, that are raising diplomatic problems which are by no means easy to solve. With all the good-will in the world to France and the French Government, there are points in the action taken by France which an English Government must subject to adverse criticism. Nothing can be more courteous, amiable, and patient than the attitude assumed by Lord GRANVILLE in the despatches relating to Tunis recently published; but, at the same time, nothing can be more explicit than his warnings that there have been mistakes made which it is incumbent on France to rectify. The union in the person of M. ROUSTAN of the two qualities of French Consul and Tunisian Minister created embarrassments which, as Lord GRANVILLE suggests, may be easily removed by some one else being appointed Consul. This is not a matter of much importance, for the French Government will be easily persuaded to find a new Consul; and the annexation of Tunis, which is to all appearance inevitable, will necessarily put diplomatic representatives in Tunis on a new footing. But it is a much graver matter when a point arises which touches the relations of France and England in Egypt. The French, in accordance with their treaty with the BEY, proposed to place all Tunisians in Egypt under direct French protection. Lord GRANVILLE uses the softest language that a long diplomatic training can suggest to him, but he gives it plainly to be understood that England will not permit this. That France should take some of the SULTAN's subjects in Egypt under her special consular protection would destroy that balance of authority in Egypt on which the Joint Protectorate is founded; and the KHEDEVE, being sure of the support of England, has announced that he will not recognize the assumed jurisdiction of France over Tunisians. Here, again, France will probably give way. It has only got to do nothing and harmony will be restored. But, although this difficulty may be surmounted by France letting the Tunisians in Egypt go on as they have gone on hitherto, the remoter consequences of the Tunis expedition must tell on the future of the Protectorate. This expedition has broken up the concert of Europe and the subsisting agreement between France and England as to the mode in which Turkey is to be treated. The divergence may not be very great, but no one can say that the attitude of the Western Powers to the Porte is the same that it was at the beginning of the year; and the Joint Protectorate in Egypt depends in a great measure on the protectors having views substantially the same as to their relations to the SULTAN.

How this Joint Protectorate was built up, what it means, and how it works, has been admirably described in the volume on Egypt which Mr. DICKEY has just published. No Englishman has written on the recent history of Egypt with anything approaching to the intimate personal knowledge, the strong sense, and the graphic power which Mr. DICKEY displays; and if his telling portraits of the ex-Khedive and NUHAR PASHA are more exciting, and if his description of the Egyptian rural population gives the best key to the permanent prospects of Egyptian prosperity, he is at once most true and most new when he traces the stages by which one of the most curious, the most successful, and perhaps the most fragile

creations of modern diplomacy, the Joint Protectorate of England and France, was called into life. The basis of the whole arrangement was the desire of the late English Ministry to conciliate France, to avoid anything like taking an advantage of the temporary depression which France was undergoing, and to undertake, so far as possible, nothing in the East alone. The occupation of Cyprus was, perhaps, a departure from this policy, but it was a solitary departure. In Egypt, at any rate, nothing could have been less aggressive, more prudent, and more conciliatory than the policy of the English Government. No English statesman can for a moment think of relaxing the hold of England on Egypt, or of suffering Egypt to fall under the exclusive control of any Continental Power; but we may be willing to share what we cannot forego. All that is necessary is that, while we share it, we should make it as clear as daylight that we do not intend to be ousted of our share; and what Lord GRANVILLE has done is, on the first occasion that arose, to give a gentle hint of our purpose. The French, we believe, attach quite as high a value to the Joint Protectorate as we do, and M. WADDINGTON thought it the great triumph of his Ministry to have secured for France in Egypt a better position than it had any reason to hope for or any very good ground for claiming. There is no change of view apparent in either Government. Lord GRANVILLE and M. ST.-HILAIRE are as much inclined to work together amicably in all that concerns Egypt as any of their predecessors were. But the force of circumstances is sometimes stronger than the force of good intentions, and it will tax the forbearance, the prudence, and the ingenuity of the best intentioned of diplomatists to surmount all the obstacles to a harmonious co-operation in Egypt which, as time goes on, the Tunis expedition will be seen to have created.

#### RAILWAY RATES.

THE Select Committee on railway rates will not complete its inquiry during the present Session, and it would be inconvenient to anticipate its conclusions. The subject was sufficiently important to justify detailed and elaborate investigation; but there is always, and especially in recent times, some danger in opening a conflict between vested rights and alleged expediency. Many of the witnesses, not without exhibitions of sympathy by some members of the Committee, have avowed their hope of adjusting railway rates with exclusive regard to the real or supposed interests of trade. The result of such a policy might be to confiscate or greatly reduce in value property to the amount of several hundred millions held in accordance with contract, under a Parliamentary title, by a vast body of large and small shareholders. Mr. TENNANT, General Manager of the North-Eastern Railway, told the Committee that the reduction in rates demanded by some of the witnesses would deprive ordinary shareholders of the whole of their income, which amounts to only seventeen per cent. of the gross receipts. Traders and travellers have received the benefit for which, through the agency of Parliament, they stipulated, by the construction of the railways, which have multiplied many times over the wealth of the commercial and industrial community; yet freighters at Liverpool and elsewhere are not ashamed to demand that railway rates should be fixed, not by Parliamentary tariffs, but on a calculation of the cheapest mode in which the transit of goods could now be effected. The capital invested in railways would never have been forthcoming but for the unhesitating reliance which was placed on Parliamentary bargains. It is true that the State offered no guarantee of remuneration, even in the form of monopoly. Almost every considerable town in Great Britain is served by two or more competing railways; and the readiness of Parliament to authorize the construction of new lines has of late years greatly increased. By the Act of 1853 undue preference is prohibited, even when it might be profitable to Railway Companies; and for the enforcement of the law a tribunal has since been instituted which, however unsatisfactory in all other respects, habitually leans against railway interests. Railway shareholders, if any of them have joined in agitation against landowners, may now learn the imprudence of tampering with proprietary right, even when it is vested in a small and aristocratic minority. Communism, or the arbitrary transfer of property from one holder to

another, is the same in principle whether it applies to shares, to debentures, or to land.

Nothing can be fairer than that any excess of charge should be strictly examined and effectually repressed. It is possible that such cases may have been proved to the satisfaction of the Committee which may, for the correction of abuses, exercise functions rather judicial than legislative, but it may be doubted whether, even if they have exceeded their legal powers, the Companies have not acted in good faith on erroneous interpretations of a doubtful law. Their customers cannot but have known of the overcharge, which they could not have been compelled to pay. In default of the success of remonstrance, freighters might have tried the question, as plaintiffs or defendants at their choice, in the ordinary courts, and in most instances they might have invoked the eager intervention of the Railway Commissioners, who welcome every interruption of their chronic leisure. It will probably be found that almost all disputed questions on alleged overcharge resolve themselves into the standing controversy on terminals. It is believed that the Committee is satisfied that the rates for transit on railway lines are exclusive of payments for loading, unloading, and similar services when they are performed by the Company. It may be expected that the Report will suggest more definite means of ascertaining the legitimate amount of terminals. Improvements might also be introduced into the classification of goods, though it will be difficult in meddling with the subject to deal with conflicts of interest, not between the Companies and their customers, but among different classes of traders. A general reduction would be grossly unjust. Even if wealth were, as some political sects appear to hold, a legitimate excuse for spoliation, the Railway Companies are not extravagantly prosperous. Only two or three small undertakings in special circumstances pay ten per cent. on their outlay. The average is from four to five per cent., and present purchasers have to content themselves with a smaller return.

Members of the Committee who were not previously familiar with railway economy may perhaps have been surprised to learn that the most complicated difficulties in the adjustment of rates arise from the competition, not of railways, but of ports, markets, and producing districts. One inexhaustible ground of dispute is furnished by the competing claims of longer or shorter distances. The nearest towns to a great commercial centre wish to retain the advantage of their geographical position against rivals who are enabled under existing rates to compete with them on equal terms. The most acrimonious assailants of the Companies were the Liverpool witnesses, some of whom committed themselves to the paradoxical proposition that their city had derived more harm than good from the introduction of railways. As Liverpool has within fifty years doubled its population, and increased its wealth in a much larger proportion, it might seem superfluous to criticise an absurd statement if it had not an intelligible meaning. Mr. FINDLAY, Manager of the London and North-Western Railway, furnished in a few words a sufficient explanation. Liverpool is, as he said, the nearest port to the richest industrial district in the kingdom, containing from four to five millions of inhabitants. The establishment of mileage rates, which were urgently demanded by the agitators, would give Liverpool a monopoly of the import and export trade of Lancashire, which is now distributed among all the Northern ports. It is unnecessary to observe that the enforcement on the railways of uniformity of charge in proportion to distance would enable Liverpool merchants and shippers to appropriate to themselves a large portion of the profit which would be withdrawn from their competitors. It is in this sense that they consider themselves losers by the construction of railways. It would be impossible for other ports to compete for the Lancashire trade, if the inland carriage were confined to roads or canals. A similar contention has for many years been urged against the rates on the North-Eastern Railway system. The Company, which has had a virtual monopoly of the district, has charged equal rates to Hull, to Hartlepool, and to Sunderland, in spite of remonstrances from the places which were nearest to the heart of the West Riding. There can be little doubt that the elasticity of the actual practice is more conducive to general prosperity than a rigid system of mileage rates.

The present condition of agriculture may serve as an excuse to the farmers for urging a grievance of their own

on the attention of the Commission. They complain that in certain instances foreign produce is carried at lower rates than domestic corn and cattle. The same apparent preference applies to some other classes of foreign goods, or of goods destined for shipment; and it is not surprising that it should be resented by traders with an adverse interest as an anomaly. The differential rates are, of course, explained by competition with sea-borne freights. If a ship arrives at Liverpool with goods destined for London, the railway can only convey them by reducing its charges to nearly the rate at which the cargo could be despatched by sea. The consignee gets the benefit of quick delivery, but his domestic competitor incurs little or no loss by the difference in the rates. The only effect of prohibiting the alleged preference of foreign goods would be that ships would be chartered to London rather than to Liverpool. To that extent the proposed legislation would perhaps operate as a protective duty. The discretion which is still left to the Companies in this and in other controverted matters is, on a balance of results, at least as beneficial to the community as to themselves. The Railway Commissioners have done their utmost to restrain the freedom of trade; and it is to be hoped that the Committee will not sanction their narrow policy. It may also be expedient to investigate the working of a most unsatisfactory tribunal. It is understood that the only lawyer on the Commission is habitually overruled by his colleagues, who assuredly possess no special aptitude for their duties. As the Commission is not trusted by the litigants who have the power of setting it in motion it finds but little occupation. At a cost of 10,000*l.* a year business is transacted which would perhaps occupy a single Judge or a Divisional Court for three weeks. The lay majority of the Commission refuses, if possible, all appeal to the superior Courts; and, consequently, its decisions are commonly impeached in the form of writs of prohibition. The jurisdiction might, with unmixed advantage, be transferred to one professional Judge, who would, in the intervals of his special employment, be available for general purposes as a Judge of the High Court. It is true that his railway functions would be less of a sinecure than at present, because he would command the confidence of the Companies and of other litigants.

#### FRANCE AND SPAIN.

THE expulsion of Don CARLOS from France has awakened no indignation, or even interest, in the French public. If the Government likes to send away a Spanish Prince, it is quite at liberty to do so. By a law passed in 1849, the French Government is authorized to give notice to any foreigner to leave France in twenty-four hours; and, if the order is not obeyed, the foreigner is arrested, imprisoned, and then conducted to the frontier. This very summary authority is used much more frequently in private than in political cases. Foreign swindlers of the highest class, against whom the police has suspicions which it thinks certainties, but not sufficient proofs, are frequently told that France has had enough of them, and they quietly disappear. This is, it must be owned, a serious limitation of French hospitality; but it is a limitation which is perfectly well known, and all French Governments cut short the residence of foreign guests when they think proper. Don CARLOS has been sent away once before from France; and on that occasion he was expelled by Marshal MACMAHON. Why the French Government should now think it worth while to expel him is a different matter. It is certainly not for reasons of domestic policy. Don CARLOS naturally associates when in France with the extreme French Legitimists, whose cause is his own. But the Republican Government treats the most extreme of Legitimist citizens with a profound and contemptuous indifference. They have lately been having a little fête of their own, as a set-off to the national fête of the taking of the Bastille. They met in their tens, drank the health of the King, and assured each other, and that tiny portion of France which listens to them, that the heart of France is palpitating for the return of its beloved monarch. The Government lets them drink and speak, and go to memorial masses, with no more thought or anxiety about them than if they were protesting their devotion to the Emperor of China. That Don CARLOS should join their company is no gain to them and no harm to the French Government.

It is the Spanish Government, and not the French, that dislikes the goings on of Don CARLOS at Paris. The King of SPAIN has a curious, if not very formidable, antagonist at Paris, in the person of his own mother. She and Don CARLOS have lately fallen into each other's arms, and this new alliance is naturally disliked at Madrid. A new-  
Carlist war is out of the question for the present; but the Carlist leaders are said to have arranged that at the coming Spanish elections there shall be small disturbances in the districts favourable to them, which will at least serve to annoy the Government, and may possibly discredit and render it unpopular, by forcing it to use means of repression. The French Government is ready to discountenance the manoeuvres of a party which, if it could succeed, would be the bitter enemy of Republican France, and which, in its fallen state, uses France as the safe centre of its intrigues. To send away Don CARLOS is to show that the French Government is alive to what is going on, and does not at all approve of it; and it is, at the same time, to do a friendly turn to the Spanish Government at a moment when the relations of the two Governments have been slightly strained by the unfortunate occurrences which have taken place in Algeria.

Everything the French Government does or does not do is naturally censured by its habitual antagonists, and the critics of the Opposition thought for a moment that a little capital might be made out of the expulsion of Don CARLOS. But the quivering flame of criticism was at once extinguished when a letter was published in which Don CARLOS bade farewell to France. It was impossible to espouse the grievances of a person who could write so foolish a letter. He began with saying that he was a BOURBON, and he did his best to prove it by showing that he inherited the family turn for always saying the wrong thing. He was expelled, he said, not by the French nation, but by the French Government; and this was a Government that had just distinguished itself by allowing Spaniards to be massacred, robbed, and ruined in Algeria. The French nation is not at all inclined to separate itself from its Government in anything that relates to Algeria, and a BOURBON who thinks more of the Spaniards in Algeria than of the French seems a poor kind of Frenchman. The French Government and the French people equally regret that Spaniards should have been the chief sufferers in the recent Arab raid; and, when a claim for indemnity was made by the Spanish Government, the French Government at once offered to take it into serious and friendly consideration. The ruined Spanish colonists have possibly a good title to be indemnified; and, as there was much popular excitement in Spain, and some mattering of hostility to France, it may have been prudent on the part of France to have turned a ready ear to the appeal that was made to it. It is by no means easy to say when an indemnity can properly be claimed in cases where foreigners suffer from disturbance or war. The French Government has had standing for some time a host of claims for compensation made by French citizens who suffered losses through the last Carlist war. If France is to pay for Spanish losses in Algeria, why should not Spain pay for French losses in Spain? There is no definite rule of international law on the subject; and all that can be said is that claims for compensation are seldom pressed, and still more rarely recognized. Englishmen would be very slow to admit that, if a troop of German emigrants went to the limits of civilization in the backwoods of Canada, and were cut off by a tribe of Indians, England could be asked to pay an indemnity to Germany. Prudence may suggest that it is worth while to spend a little money to soothe Spanish feeling; but there is no real ground for the indignation supposed to be felt by the Spaniards against France. The Spanish colonists were not worse treated than Frenchmen in Algeria. They had just as much protection, and that this protection was very insufficient at a particular place and time was true, but was a consequence of the general mode in which the French govern Algeria. The Spaniards were murdered and ruined, not because they were Spaniards, but because they had chosen to go to a spot in a French dependency which was exposed to a raid, the outbreak and direction of which no one could have foreseen. The French cannot make persons absolutely safe who go to the edge of cultivation far away from places where bodies of troops are concentrated. They can only give the security which springs from the terror of their name, and from the

certainty that sooner or later troops will come to punish wrongdoers if they can catch them.

The new-born hostility of Spain to France, so far as it exists at all, would therefore in any case soon die away. It will die away, perhaps, all the sooner because France is willing to please the Spanish people by discussing an indemnity and to please the Spanish Court by expelling Don CARLOS. But the notion that France, which sees with alarm and regret that it has to spend more money and more men in the interminable task of putting down an Algerian insurrection, has done any special wrong to Spain, because Spaniards who chose to go to one part in Algeria have suffered as Frenchmen would have suffered in their place, is too unsubstantial to colour national feeling for any length of time. Nations are only guided, except in moments of feverish excitement, by considerations of their permanent interests. No doubt the Spanish Government must have asked itself how the Tunis expedition affects the permanent interests of Spain, and the conclusion to which it appears to have come, and which was the only conclusion to which it could have come, was that the interests of Spain were not much affected at present, but that they might be affected in a not remote future. If Tripoli is on one side of the new French territory of Algeria and Tunis, Morocco is on the other; and France will find the same difficulty in allowing Morocco as in allowing Tunis to be permanently possessed by a Mahomedan Power. For a time France may hold its hand. It may be content with putting down the Arab rising in Algeria, and with occupying Tunis with a force sufficient to make it really a French territory. But sooner or later it will try to rid itself of the inconvenience of having its disaffected Arab population shut in between two Mahomedan States. What a Spanish statesman with a reasonable amount of foresight has to ask himself is whether it would promote the permanent interests of Spain that she should occupy Morocco even if she were invited and stimulated by France to do so; and it may be observed that it will not be semi-hostile relations, but very friendly and cordial relations, between France and Spain that will bring Spain to the critical point of having to make a decision. So far as foreigners can judge, Spain would be making a fatal mistake if it fell into the trap of a grand Morocco expedition. It would have to spend much money which it could ill afford to gain a territory which would bring in nothing. It would have to go on year after year subduing refractory Moors. It would make itself answerable to France for the suppression of border raids; and, above all, it would be creating a new Cuba at its doors whence a popular general would be always likely to come to demand a change of Ministry, and the advancement of himself and his followers. These are, it is true, speculations as to a future which may be far off; but one effect of the Tunis expedition has been to set the European world thinking, and Spaniards must be supposed, like other people, to think sometimes of matters that seriously concern them.

#### THE PARIS POLICE.

THE resignation of the Prefect of the Paris Police is an incident of something more than local interest. It is the last scene in a little play which has displayed in a very curious light the relations of the French Government with the Radicals of the capital. The origin of the quarrel between M. ANDRIEU and the Paris Municipal Council is not now of any moment. The Council have for some time been of opinion that the police have abused their powers, and that they have been supported in doing so by M. ANDRIEU. Under these circumstances there were two steps which the Council might properly have taken. They might have asked the Prefect to reprimand or dismiss his erring agents, and in the event of his refusing their request they might have asked the Minister of the Interior to reprimand or dismiss his erring subordinate. This method of action did not commend itself to the Municipal Council. The police of Paris are paid by the City and controlled by the State, but the Municipal Council consider that the control as well as the payment ought to be in the hands of the citizens, and after the manner of their sect they regard the thing that ought to be as the thing that is. In the complaints urged against the police they saw—perhaps they had created—the occasion they wanted. An

“interpellation” was brought forward at one of their meetings, and the Council passed a vote of want of confidence in the Prefect just as the Chamber of Deputies might have done in the case of an unpopular Minister. M. ANDRIEU very properly took no account of this vote, and it was finally annulled by the Government as exceeding the powers of the Council. Thereupon the question was raised in the Chamber by a member of the Extreme Left. In the debate that followed the Government said, fairly enough, that they thought the police arrangements of Paris unsatisfactory, inasmuch as the payment and control of the force were not vested in the same hands, and that they intended to bring in a Bill transferring the police estimates from the municipal to the State Budget. At this point it seemed that the whole affair had come to an end. The Chamber was perfectly satisfied with the Ministerial announcement; and any injustice that might be involved in making Paris pay for a police which is not under the orders of the Municipality would be removed by the promised Bill. Ever since that time, however, the controversy has been kept up in the newspapers. The organs of the Extreme Left at once set to work to denounce a proposal which they described as designed to make the present degradation of Paris permanent instead of temporary. Why, they asked, should the capital be placed at a disadvantage which is not shared by smaller towns? The measure to which the Government had committed themselves was a direct blow at the principle of local self-government. If the independence of Paris could be destroyed, why should the independence of a single commune in France be respected? The answer to this indignant inquiry was obvious. The independence of Paris needs to be restrained lest the independence of every other commune should be destroyed. The resemblance between the two cases is purely superficial. The reasons which make it inexpedient to give Paris the control of its own police apply to no other town. The reasons which make it safe to give other towns the control of their own police do not apply to Paris.

It was not, however, the arguments employed that gave the question its importance. The controversy was too one-sided to be interesting. What was really significant was the timid attitude taken up by the Republican party on the question. Where the Government were plainly in the right, the natural thing would have been to support them frankly. Instead of this the subject was approached with as much hesitation as though it had been surrounded with doubt and difficulty. The point chiefly insisted on by the Republican journals was the necessity of devising a *modus vivendi* between the Government and the Municipal Council. Unless some compromise could be discovered the Government would have to meet the electors with a quarrel with the City of Paris upon their consciences. To outsiders it rather seemed that in such a cause as this the Cabinet could not do better than have their consciences thus burdened. Their best title to the confidence of France would be the fact that they had quarrelled with Paris. The motive which underlies the claim of the citizens of the capital to be masters in their own house can be readily divined; in point of fact, the Municipal Council have been at no pains to conceal it. They represent the party which either boldly professes or weakly acquiesces in the demand originally put forward on behalf of the Commune. They do not acknowledge that the peculiar relations which must always exist between the capital and the Government have any bearing on the question. As no Government which is at issue with the people of Paris can have any right to exist, there can be no reason why the Government should be protected against the people of Paris. The logical result of this contention would be that the police of the City, and, in time of peace, such military force as may happen to be stationed in the City, should be under the control of the Municipal Council. For the present, however, it is useless to put forward more than the smaller half of this claim. Even among the Extreme Left, a proposal to make the Military Governor of Paris responsible to the Municipal Council might find but few supporters. In what direction then was this *modus vivendi* between the Government and the Municipal Council to be sought? The answer given to this question even by journals like the *République Française* deserves to be remembered. The compromise suggested was that the Government should get rid of the obnoxious Prefect of Police. A personal sacrifice might disguise the impossibility of abandoning the principle. In

their joy at having driven M. ANDRIEU from office the Municipal Council might forget that the new Prefect would be no more their servant than his predecessor. Whatever might be the ideal distribution of power between the Municipal Council and the Minister of the Interior, the Prefect of Police ought to make the best of the existing distribution. The fact that he was on bad terms with the Municipal Council carried its condemnation with it. It proved that M. ANDRIEU had not learned how to serve two masters, and consequently that he was unfit to hold office in which it was at all events necessary for him to make believe that he had two masters.

If this advice had been disregarded, it would still have merited some notice by reason of the position of those who offered it. But it becomes immeasurably more significant when it has been taken. The Government have not formally dismissed M. ANDRIEU, but they have accepted his resignation. Whatever may have been his disqualifications for the difficult office he held, more treacherous counsel could not have been given to a Cabinet, nor could a Cabinet have been guilty of a greater blunder than to follow it. M. ANDRIEU's resignation would not have been offered if he had not known or suspected that he could not count on the support of his superiors; and the acceptance of it is an intimation to the country that, as a matter of fact, he did not receive the support of his superiors. What is this but an admission on the part of the Cabinet that, as things stand, the Prefect of Police is not independent of the Municipal Council, and that M. ANDRIEU was to blame for acting as though he was independent of it? Some other meaning, no doubt, will be put upon the act by the supporters of the Government; but this is the meaning which the Municipal Council will put on it, and which the Radical party throughout France will put on it. What is perhaps of even more moment is the meaning which M. ANDRIEU's successor will put upon it. The new Prefect of Police will realize keenly that if he wishes to retain the favour of the Government he must, before all things, take care to retain the favour of the Municipal Council. Nor will he find the Municipal Council an easy taskmaster. The majority of its members very well know what they want, and they will not be content in the end without trying to get what they want. They will not eventually succeed in getting it, because France, now that she has learnt that if she is so minded she can put down Paris, will not again submit to the dictation of Paris. But, for all that, France may have to pay a very heavy price for the weakness of her rulers. The elements which went to make up the Commune are still to be found in Paris. There is the old poverty, the old passionate hatred of the well-to-do classes, the old devotion to impossible political ideals, the old determination not to believe that these ideals are incapable of realization. A city whose temper can be thus described is not likely to omit to take the ell when once the inch has been given it. It has set itself to overthrow M. ANDRIEU; and, though the probabilities were all the other way, it has succeeded in overthrowing him. Victory will certainly not teach it moderation; and if, as the event has proved, the Cabinet were afraid to meet the electors with M. ANDRIEU as their Prefect of Police, they will hardly shrink from further concessions if they should be found necessary to the end they have in view—that of presenting France and Paris in the character of brethren who dwell together in unity.

#### THE PATRIOTIC FUND.

IT is required of a benevolent fund that it be found solvent. When such a fund has been created by a great public enthusiasm and is administered by very eminent persons it is all the more important that this humble but necessary condition should be fulfilled. The evil of the example given has to be taken into account as well as the disappointment inflicted on those who have vainly counted on the benefits which the fund was to confer on them. We are sorry to say that the Nineteenth Report of the Royal Commissioners of the Patriotic Fund reads like a penitential statement from a well-meaning but blundering village club. It is true that the Patriotic Fund is not kept up by the subscription of those who look forward to benefiting by its grants. But when the administrators of a public fund undertake to make certain payments for the lives of certain persons or for the bene-

fit of a specific class, and do actually make them for a number of years, those who receive these payments naturally expect to go on receiving them. The reason, according to the Registrar, why a Friendly Society ought to take stock of its engagements, and of the means it has for meeting them, is that without doing so "a Society cannot tell whether it can afford to go on paying the benefits "it has promised, or whether it is on the way sooner or "later to break up, and leave its members helpless." This is precisely what for many years the Patriotic Fund did not do. Considering the semi-public character of the Fund, and the illustrious, noble, and distinguished names which appear among the Royal Commissioners, the omission to do it must be regarded as strangely unfortunate.

The first serious notice of this state of things was taken by the War Office in August last. The SECRETARY of STATE had had his attention specially called to an actuarial estimate which had appeared in the previous Report of the Commissioners. On looking into it he thought the matter so serious that he sent for the Chairman and Secretary of the Executive and Finance Committee, and requested that an estimate might be prepared of the aggregate assets and liabilities of the Fund. On August 19 General LEFROY, the Chairman of the Executive Committee, and Mr. HAMILTON, the Accountant-General of the Navy, who had undertaken the suggested inquiry, presented their Report. The figures, as given in the last preceding official valuation, had shown the estimated liabilities of the Fund to be 431,050*l.*, and the assets to be 443,637*l.*, leaving a surplus capital of 12,587*l.* The first observation the referees had to make upon this calculation is that it left out of account a school—the boys' school at Wandsworth—for which, though it was intended to be permanent, no permanent endowment had been provided. They calculated that to complete this endowment 60,000*l.* ought to be subtracted from the assets. The only entry connected with the school on the liabilities side being one of 7,892*l.*, the ultimate result of this withdrawal was to convert the surplus of 12,587*l.* into a deficit of 39,521*l.* Apparently this was not the only case in which the intentions of the Commissioners had been more permanent than the means devised for carrying them out. The referees estimated that to meet the prospective charge of advanced age allowances 32,000*l.*, and to meet the education of the sons of Roman Catholic soldiers 30,647*l.*, would have to be provided over and above the demands covered by the assets. The deficit is thus brought up to 102,168*l.* The referees then turned their minds to the expenses of management; and, as these amounted to 4,000*l.* a year, they were not long in coming to the conclusion that the sum required to meet these expenses for the future "must largely exceed the sum of "29,125*l.* inserted in respect of this liability in the official "valuation." A fresh valuation was, therefore, made, when it turned out that, even on the assumption that the present staff is reduced by not filling up vacancies, and that only a small staff is permanently retained, the deficit to be allowed for under this head would be 26,365*l.* The total deficit is thus brought in round numbers to 128,000*l.* Even this sum, however, does not comprise the whole of the possible shortcoming. Of late years, the referees say, the maintenance of the sanitary establishment for girls at Margate has cost the General Fund from 800*l.* to 900*l.* annually, while the girls' school at Margate owes the General Fund about 2,500*l.* If these liabilities are to be taken as continuing, a further sum of from 20,000*l.* to 25,000*l.* must be set aside to meet them. The referees, however, are of opinion that "means might "be found which, coupled with careful and economical "management," might not only render the girls' school self-supporting, but enable it in addition to bear the cost of the sanitary establishment. They have not, therefore, included this item in their own calculation of the deficit. The SECRETARY of STATE was less sanguine on this head—perhaps distrusting the success of the Royal Commissioners in the direction of economical management—and in the letter to the Secretary of the Patriotic Fund, enclosing the Report of the referees, he describes the liabilities of the Royal Commissioners as, "at a reasonable estimate," exceeding their assets by about 150,000*l.*

This is the state of affairs with which the Commissioners had to deal when preparing their Nineteenth Report. It cannot be said that their treatment of the question is in any sense satisfactory. They propose, of course, certain reductions in the expenditure of the Fund.

But then the need of making such reductions is precisely the thing against which precautions ought to have been taken. The widows and orphans of English soldiers and sailors have been taught to expect certain benefits; and to withdraw these benefits after they have been virtually, if not formally, promised will have an ugly likeness to a breach of public faith. If the impossibility of keeping the promises made by the Commissioners had been due to accident, it would have been unfortunate and nothing more. But in this instance it is due to what it would be over-politeness to call an accident. It can hardly be a thing of chance that the last official valuation was wrong by 150,000*l.* The Actuary's Report, made after the Report of the referees, reduces this deficit to about 117,000*l.*; but in this estimate no account is taken of the expenses of the girls' school at Margate. Whichever of these sums may be taken as most accurately conveying the excess of the Commissioners' liabilities over their assets, the undetected existence of so large a deficit calls for an explanation which, oddly enough, neither the Commissioners, nor the Executive and Finance Committee who have made a Special Report on the subject, seem to think it within their province to furnish. The Commissioners say, no doubt with perfect truth, that it has been their earnest desire to make the benefits granted from the Fund as comprehensive as possible. In 1867 they opened the Fund to orphans, who, by the then existing rules, were excluded from it. In 1870 they made a similar concession to children left orphans by wars subsequent to the Russian war. "The cost of the education of these additional cases, and all grants to the children of officers on this extended basis, became a charge upon the estimated surplus." As long ago as 1874 the Commissioners found that the new demand on the Fund thus created "would be overwhelming"; and, before they could stop further applications, they were committed to a sum much exceeding that which they had originally contemplated. Another contingency for which no proper provision had been made was the deaths of second husbands, and the consequent return of widows to their full allowance from the Fund. In one year the Actuary found it necessary to increase the estimated liability under this head alone by 22,533*l.* Then the expenses of the boys' school at Wandsworth were based on a calculation that each boy would cost 17*l.* 10*s.*, whereas the real cost has varied from 24*l.* to 30*l.* No doubt these errors fully account for the deficit, but at present no explanation has been given of the errors themselves. How did it happen that the Royal Commissioners were either supplied with such imperfect information, or made such an imperfect use of the perfect information supplied to them, that they made these blunders as to the extent of their own ability as trustees of the Fund to meet the demands made on it? The lives of the second husbands of soldiers' and sailors' widows can hardly defy actuarial calculation, and a pretty close guess could surely have been made at the cost of maintaining a boy at a charity school. The melancholy result of the Commissioners' extraordinary inaccuracy is that they have had to give directions for closing the school before the end of the year. We are not prepared to contest the soundness of this conclusion; but, if no further explanation of the reasons which have made it unavoidable is forthcoming, the penitence of the Commissioners ought to be very much more public and exemplary than they have yet thought fit to make it.

#### THE FUNERAL OF PIUS IX.

IT is some time since an Italian Ministry has shown any marked political capacity. To some extent perhaps this want is due to the consciousness that they represent no certain force in the country. The Italian electorate is a very limited one, and a considerable portion even of this limited electorate take no part in the elections. If under the English suffrage of 1832 no Conservative had voted, the Parliamentary strength of the Radical party would have been very much in excess of its real hold upon the nation, and there may be a similar flaw in the present distribution of parties in Italy. The Roman Catholic voters do not go to the poll, the larger part of the population have no votes, and the consequence is that, among those whose votes determine the result of the elections and the composition of the Chamber of Deputies, the Radicals command a strong majority. This seems to be the explanation of what

would otherwise be the unaccountable shortsightedness of the Italian Government in presence of the insults offered to the funeral procession of the late Pope. The vast and orderly crowd of spectators has been estimated as amounting to one hundred thousand persons, and an unprejudiced eye-witness puts the number of the assailants of the procession in the first instance at fifty or sixty. It would seem to follow from this that it would be the interest of the Ministry to identify themselves heartily with the orderly spectators. Had the procession been carrying the body of a private citizen to the grave, the Government would have been bound to protect those who took part in the ceremony from any unseemly interruption; while, if by any mischance they had failed to do this, they ought, at all events, to have offered a prompt and straightforward apology for the omission. But PIUS IX. was not a private citizen. He was a sovereign prince, recognized as such by the Italian Executive and the Italian Legislature, and having, therefore, certain well-defined rights to public honours. It is a complaint of long standing with the Italian Government that the Pope takes no notice of the Law of Guarantees, and shuts himself up in the Vatican as though he could not safely come out into the city. The reception given to PIUS IX.'s body on its journey from St. Peter's to San Lorenzo was likely, therefore, to be taken as an earnest of the reception which would await LEO XIII. if he once more trusted himself in the streets or in the great basilicas. This is the light in which it is said to have been regarded by the Pope himself. An apparently well-informed Correspondent of the *Times* declares that he has sufficient grounds for believing that, had all gone quietly, LEO XIII. would have taken the occasion he desires for terminating the "imprisonment." What "A Resident in Rome" has the means of knowing could scarcely have been a secret to the Italian Government. One of two things, therefore, must be believed of them. Either they did not wish LEO XIII. to come out of the Vatican, and so were not anxious that all should go quietly; or, while wishing him to do so, they thought it either unnecessary or imprudent to take any precautions against disturbance. In the first case they must be credited with a very imperfect appreciation of Italian politics. The relations between the Pope and the Government have been the great difficulty of successive Italian Ministries, and a Cabinet which did not welcome any approach to a better state of things would stand condemned of preferring the gratification of some small ends of its own to a great national advantage. In the second case they must either be very ignorant of the people they have to govern or very much enslaved to their extreme supporters in the Chamber. In every great capital there is a minority of ill-disposed persons who are always searching for opportunities of riot and outrage, and a funeral associated with such bitter religious antagonisms as that of PIUS IX. would be sure to suggest itself to this faction as precisely the occasion they were on the look-out for. It seems incredible that this probability should not have presented itself to the Government; and the only remaining explanation is that any intervention on their part to prevent disturbance would make them unpopular with the Radicals, and so possibly expose them to the risk of being left in a minority on some critical division.

The plea that they were taken by surprise seems incompatible with the action of the Government since. An insult of the grossest kind had been offered to the Pope; and, if the omission of the Government to prevent this had been purely accidental, they would naturally have been eager to repair it. Instead of this, they seemed anxious to make it appear that the riot had been provoked by the Catholics, and that the blame was pretty equally distributed between those who took part in the procession and those who insulted it. It seems not unlikely that the motive of some of those who accompanied the coffin to San Lorenzo was to excite the very riot which actually took place. "The torch-bearing procession," says the same Correspondent of the *Times*, "was organized by the old zealots in distinct opposition to the representations of the CARDINAL VICAR, in the hope of provoking what, in fact, happened, and so effectually to prevent the Pope from passing the doors of the Vatican." This fact does not, however, in the smallest degree excuse the course taken by the Government. They knew beforehand that the body of PIUS IX. was to be removed on a certain night, and they ought consequently to have either refused

the authorization for the removal, or to have made certain stipulations as to the character of the procession, or to have taken adequate precautions to insure that it should be unmolested. They were naturally unwilling to take the first course, which would have been tantamount to an admission that they could not keep order in the city; or the second, which would have made them appear as forbidding religious funerals, while allowing funerals of a political character; and the reason why they shrank from taking the third course has been already suggested. In any circumstances, however, they might have been expected to try and repair their error after it had been committed. Instead of this, they did their best to make it worse. On every Sunday during this summer there are jubilee pilgrimages to the various Roman basilicas, and on the Sunday following the removal of Pius IX.'s body to San Lorenzo these accustomed pilgrimages were forbidden. With full warning that the Catholic population of Rome were threatened with molestation in the performance of their customary religious observances, the Government thought proper, not to prevent the molestation, but to forbid the religious observance. A somewhat parallel case would be if Mr. BRADLAUGH's friends should take it into their heads to break up the procession at Dean STANLEY's funeral next Monday, and thereupon the HOME SECRETARY should close Westminster Abbey to-morrow week. The Italian Government have shown similar weakness in dealing with certain low papers which have published some brutal abuse of the late Pope. Ordinarily speaking it may be wiser to let outrages of this kind pass unnoticed; but, when they come at the tail of similar outrages in fact, and at a moment when a commonly prudent Government would be seeking for means of offering some reparation to the living Pope for the insults offered to the dead, a prosecution of these journals for violation of the Law of Guarantees would have been a matter of obvious good policy. The incompetence of the Cabinet comes out all the more clearly because the PRIME MINISTER is also the Minister of the Interior. He had therefore no colleagues to consult. The responsibility which devolved upon him was one that concerned his special department, and there was no superior over his head to whom he might have to justify his action. It is greatly to be regretted that this incident should have happened, because it makes it impossible, at all events for the time, that LEO XIII. should make any further advance in the direction of living in peace, if not in amity, with the Italian Government. He may even think that his appearance outside the Vatican would be a signal for the same kind of manifestation as that which greeted the coffin of Pius IX., and that the Government are apparently unwilling or unable to give effect to their own law by according to the Pope either the honour due to a sovereign or the protection due to a subject.

#### THE LATE DEAN OF WESTMINSTER.

THE death of the Dean of Westminster last Monday night after only a few days' illness, at no very advanced age and in the full vigour of his powers, removes with startling abruptness a conspicuous figure from the scene. There are very few persons not occupying a still higher position, in Church or State, who have attracted so much of public attention, or whose death would call forth so universal a chorus of lamentation, comment, and eulogy. And if we are not, as our readers will readily conceive—for the acts and writings of the late Dean have very frequently challenged notice in our columns—able to join unreservedly in the effusive laudations so copiously showered on his memory, one thing at least is attested by the very prominence of the place he had made for himself in the world's estimation from the first. For it may fairly be said that from the day when Stanley and Vaughan, then Dr. Arnold's two most promising and devoted pupils, were "bracketed even," as Bishop Wordsworth, who examined them, has just reminded us, in the Sixth Form examination at Rugby, he always held his own. The fact is that he had in a remarkable measure what we are often told the conditions of modern society are making less and less possible, the gift of individuality, or, as Mr. Matthew Arnold would say, "distinction." In his whole character, attitude, and tone of mind, as in his person, there was an unmistakable idiosyncrasy. You could generally be pretty sure beforehand what line he would take on any given subject, and that it would be like himself and unlike everybody else. One of his panegyrists has observed that the Dean "never twaddled, or declaimed, or repeated himself." Certainly he did not twaddle, nor was declamation much in his line, for that implies real or simulated passion, and he was not a religious enthusiast, still less an actor, but as to his never repeating himself, it would be more accurate to say that he repeated himself in every volume or

article he published, almost in every sermon he preached. We do not, of course, mean to say that he repeated himself in the way, for instance, that Dr. Cumming did, but that one leading idea, which was apt to become somewhat tedious from constant iteration, formed the keynote of his teaching as of his life. He was always harping on one string, and whether history, or theology, or ecclesiastical discipline was the professed subject of discussion, the supreme excellence of liberalism or "latitudinarianism"—the term in his mouth was one not of reproach but of honour—would invariably turn out to be the moral of the tale. This has indeed been made by his admirers their special theme of commendation, but neither in an intellectual nor a moral sense can the praise be accepted without reserve. In one respect, however, it is pleasant to be able to put on record the unanimous agreement of all, however widely differing in principle, who came into contact with him. In his personal conduct and demeanour his liberality was alike graceful and genuine, and knew no distinctions of opinion, school, or creed; after the fiercest wranglings in the Jerusalem Chamber the Dean and Archdeacon Denison, who the other day paid a warm tribute to his memory in Convocation, might be seen seated side by side in friendly converse in the hospitable refuge of the Deanery drawing-room. He was, in short, a thoroughly amiable, kind-hearted, and generous man in all the relations of private life, and the various positions he successively occupied, especially during his later years at Westminster, gave him abundant opportunities of exhibiting those estimable qualities, of which he was never slow to avail himself. It has been said, probably with truth, that he never had a personal enemy; and to this kindness of heart was added the rare charm of social graces and powers which made his presence an acquisition to every company he entered. We are the more anxious to render this just tribute, because, as will presently appear, we cannot unreservedly endorse all the commendation bestowed on the impartial breadth of his liberality in a wider sphere. But that inquiry runs up into a general estimate of his position as a writer, a theologian, and a dignified and influential Churchman.

Lord Beaconsfield exemplified his wonted felicity of phrase when he selected "picturesque sensibility" as the special characteristic of Dean Stanley's mind. He was not a deep or philosophical thinker, and therefore was never likely to wield such influence as e.g. Cardinal Newman has exercised on one side, or, to name divines more nearly allied to him, Professor Jowett or the late Mr. Maurice on the other. The marvellous effect attributed to Dr. Newman's sermons at Oxford, which has been lately described with thrilling force by a very unsympathetic hearer, could never be produced by any discourse of Dean Stanley's, who was a graceful and picturesque rather than a touching or eloquent preacher. For theology properly so called, that is for the abstract discussion of doctrine, he had a positive incapacity and distaste, though he was constantly writing about it. It was not so much that he disliked this or that particular tenet, as that he disliked and failed to grasp the idea of doctrine or dogma altogether, and his liberality on its intellectual side was largely based on his inability to appreciate distinctions which to him were empty forms. He had an instinctive aversion to definite statements on abstract subjects, not because they were false, but because they were definite, and one could as little conceive his being martyred for a specific heresy as for an article of the Creed. Had he lived in the fourth century, he would have fully shared Gibbon's unphilosophical contempt for a Christendom divided about "the difference of a single diphthong," and would have been as little willing to subscribe or to condemn the Arian confessions as the Nicene Creed. One could almost imagine his sharing the fate of the unhappy victim of Turkish red-tapism, who is said to have been executed at Constantinople, not for being a Mahometan or a Christian—for he was free to profess either religion—but because he could not decide, or at least could not intelligibly explain, to which of the rival creeds he adhered. In a lecture to working men some years ago Dean Stanley ridiculed the notion of psychology or theology being at all concerned in the problems raised by the Darwinian theory of the origin of species. He told the students of St. Andrew's, on another occasion, that "the faith of each successive epoch of Christendom has varied enormously from the faith of its predecessors"—which only shows his strange incapacity for distinguishing fixed doctrines from passing phases of opinion—and that "the true faith" has been to no one more largely indebted than to "the excommunicated Spinoza," who is usually regarded as having been either an Atheist or a Pantheist, but to whom, the Dean thought, "was vouchsafed the clearest glimpse into the nature of the Deity." In a paper on the three Creeds, published only last year, while dismissing as no better than "algebraic symbols" and "arithmetical enigmas" the doctrines they are commonly supposed to contain, he seeks to elicit from them some broader and loftier, but scarcely intelligible, conception of "Christianity, as it has appeared to Voltaire, Rousseau, Göthe, Mill, Renan." He would not have said in so many words, with Strauss in the *Leben Jesu*, that "the moral contents of Christianity" are alone valuable; but from first to last, whenever he spoke—as in his latest and not least typical work on *Christian Institutions*, and in the highly characteristic posthumous paper "On the Revised Version of the New Testament" published in last Wednesday's *Times*—of "the great doctrines which all Christians alike hold," he invariably and exclusively referred to the moral, as distinct from the doctrinal, teaching of the Gospel. It is difficult to understand how such vague and colourless exhortations can, as Archbishop Tait declared the other day in Convocation, have "con-

firmed in the faith vast numbers whose temptations lay entirely in the direction of scepticism"; for, if anything beyond faith in moral goodness is intended, the question must at once arise, in what faith were they to be confirmed?

To say with one of his critics that the Dean was less a theologian than an ecclesiastical historian is greatly to understate the case. He was not and never could have become a theologian at all, and unfortunately his theological or anti-theological peculiarities, combined with the inveterate passion for paradox which grew out of them, materially affected his character as an historian also. The same vagueness of mind which led him rather to adumbrate than to define his theological views reappeared in his treatment both of Jewish and Christian history. As a writer he was versatile rather than accurate, brilliant rather than profound, and was always happier in illustrating his subject than in explaining it. And to our mind those works, like *Sinai and Palestine*, and the interesting *Memorials of Canterbury and of Westminster*, which gave the amplest scope for pictorial illustration and the least for theological or ecclesiastical disquisition, were at once the most pleasing and most instructive of his writings; the *Life of Dr. Arnold*, which first brought him into public notice, stands in a category by itself, from the peculiar charm as well of the subject as of the treatment. In his *Lectures on the Eastern Church* his description of the Council of Nice throws far greater light on the details of the national costume and temperament of the assembled prelates than on the momentous question they met together to decide for all future ages of the Church; while elsewhere he dismisses the whole series of General Councils as of no practical value, because they failed to accomplish what of course they never attempted or from the nature of the case could possibly have achieved, and did not create the art, the science, the literature, the poetry, the philanthropy, or even the theology of Christendom. It did not occur to him that the same line of argument would prove the English Parliament to be useless. All competent judges again will agree with Mr. Lecky that Christianity has created three things generally recognized as special types and expressions of its religious sentiment, "the church bell, the organ, and the Gothic Cathedral." But Dean Stanley's paradoxical temper led him to argue in *Good Words*, in defiance of all historical evidence, that there is nothing distinctively Christian, still less distinctively Catholic, in Gothic architecture, and that, in fact, it has closer affinities with Protestantism than with Catholicism. But we need not go further into detail, the more so as the subject has often before been brought under the notice of our readers. Those who are familiar with his writings will be aware that Dr. Stanley was hardly more reliable as an historian than as a divine; and it was a peculiarity of his mind that, while he was constantly making mistakes, which were at once detected and exposed by his critics, he was never able to recognize them himself.

It remains to say something of the Dean's career as a Churchman, "the successor," as he was fond of styling himself, "of the Abbots of Westminster." And considering the singularity of his own views and policy in Church matters there was a curious, though probably accidental, fitness in his occupying the one post of eminence in the English Church independent of all episcopal control. The mitred Abbots of Westminster were exempt from all superior jurisdiction save that of the Roman Pontiff, and when the Abbey was suppressed by Henry VIII. the same immunity passed on to the Dean, subject only to the supreme authority of the new Head of the Church, which for centuries past has meant that for practical purposes they can do as they please. This exceptional immunity of the Abbey Church enabled Dean Stanley to try experiments there which could have been tried nowhere else. On one occasion he induced a layman to preach in the nave, and more than once he invited suspended clergymen or Nonconformist ministers to occupy the pulpit—an offer they had what most people considered the good taste to decline. That however was only one illustration of the ecclesiastical liberalism which shaped the Dean's peculiar view of the relations of Church and State. He is credited with being fearless and impartial in the breadth of his toleration and always ready to defend the unpopular side. In one sense this is true, but not in another. It need hardly be said that in the present day the liberal or latitudinarian is really the popular side, and few men enjoyed a wider popularity in the outer world than the Dean of Westminster. But it is true that he braved, one might almost say scorned, ecclesiastical public opinion, and among his own order and in the Church generally he was an object of suspicion. But for a man holding a dignified and independent position, with a powerful public opinion and very high authorities both civil and ecclesiastical at his back, it did not perhaps require any very exceptional courage to face a clerical opposition which at worst could only denounce him, and which, with all his personal forbearance to individual opponents, he never hesitated to denounce and satirize, not without some asperity, in return. On the other hand his liberality, however wide, was most readily and freely extended to the left wing of his own party. We have never heard for instance that his voice was lifted against the worrying Ritualist prosecutions or the harsh penalties which in some cases followed them. Yet, even assuming all the Privy Council judgments to be sound in law, and the Ritualist contention in every respect mistaken—which is a strong assumption—the victims had surely as much claim for toleration as Mr. Gorham, or Dr. Colenso, or the *Essays and Reviews* writers—of whom it was said at the time that "they escaped by the skin of their teeth"—or Mr. Voysey, who did not escape, or Mr. Stopford Brooke, who did not indeed incur legal censure, but felt bound in

honour to retire from an untenable position; and for all these Dr. Stanley manifested an active sympathy. It may be replied that every one, however comprehensive his toleration, is most keenly alive to the wrongs of his own party, and, of course, that is perfectly true; only something must in fairness be discounted from the impartial largeness of a toleration which is chiefly exhibited towards partisans whose extreme opinions incline to the extremity most nearly in harmony with one's own. And the public protests twice raised against himself by Churchmen of markedly moderate and conservative temper—one by Bishop Wordsworth, then Canon of Westminster, against his installation in the Deanery, the next some few years later by the Dean of Norwich against his appointment as Select Preacher at Oxford—suffice to prove that Dr. Stanley needed for himself a full measure of the toleration he claimed for others. It was characteristic of his one-sided liberalism in historical questions that, while he fiercely denounced "the atrocious Act of 1662," which imposed subscription to the Prayer-Book and led to the ejection of two thousand Nonconformist ministers from their livings, he had no word of censure for the far more sweeping ejection of episcopal clergy under the Commonwealth, into whose places they had been thrust. In practical matters, his eagerness to secure for the Abbey the remains of the author of *Puckwick*, at the cost of forcing the hand of his family and contravening his own express directions, contrasted oddly with the omission to offer a resting-place in the same hallowed precincts to the author of the *Christian Year*.

This reminds us to say a word in conclusion on the peculiar theory of the relations of Church and State which held a prominent place in the Dean's entire teaching and policy. He never, of course, precisely defined it, any more than he defined his theological views, but it would not probably have differed very widely in substance from the scheme propounded by his old master, Dr. Arnold, that all sects except Jews and Roman Catholics should be united, by Act of Parliament, in one national communion. Their differences of belief or worship would have appeared to him of infinitesimal importance, or, rather, one main advantage of a Church Establishment was to hold such differences in check. At a great meeting convened in St. James's Hall to protest against the disestablishment of the Irish Church he commenced a speech, which the frantic howls of his fervently Tory audience would not allow him to finish, by declaring that he was "a Whig of the Whigs and a Liberal of the Liberals," and intended to support the motion on Liberal principles. He would no doubt have explained at length, had he been suffered to proceed, what he took occasion to set forth in print more fully elsewhere, that the essence of an Established Church is "to be under the supremacy of the Crown—that is, of the law," and that Joseph II. of Austria was his model of a liberal monarch. He was careful to add that the possession of endowments, and still more of any exclusive system of doctrine or polity, or any separate clerical order, is not of the essence of the Church; that it should be made as comprehensive as the nation, all theological tests being abolished, "except, perhaps, the Apostles' Creed"—this doubtful exception disappears from some later writings on the subject—and that "every man capable of rendering good service to the community be recognized as a minister." The advantages of this arrangement are further explained to be that it secures to the Church the supremacy of just and good laws—though one hardly sees why all Church laws should be necessarily bad and all State laws necessarily good—that it gives scope for the growth of various diversities of opinion; and that it protects "humble and devout souls from being borne down by the current of local and transitory clamour," which was supposed to refer to Bishop Colenso, whose quarrel with the South African bishops was then at its height. In a lecture delivered some years afterwards in Scotland the Dean pronounced a still more emphatic eulogium on "the principle of a national Establishment;" not indeed that the State gains anything from union with the Church, but, on the contrary, "the Church is elevated and enlarged by contact, however slight, with so magnificent and divine an ordinance as the national Commonwealth." It was in strict accordance with these views that when in Scotland the Dean habitually worshipped and preached in the Established Presbyterian Kirk, and held aloof entirely from the unestablished Episcopal Communion. The simple fact of establishment was to him a far more fundamental "note of the Church" than any speciality of doctrine, discipline, or ritual. We need not stay to discuss here whether such an establishment as he adumbrated and desired could ever become a practical reality, or how far, if *per impossibile* it came to be realized, it would differ from what Mr. Goldwin Smith once called "an established chaos." It is sufficient to have indicated the true nature of the ideal of "toleration, charity, and comprehensiveness"—as an ardent panegyrist has worded it—which Dean Stanley made it the aim of his life to promote, and which he appears to the last to have expected or hoped might some day be translated into fact. Its very vagueness and impracticability give a sort of grandeur to the ideal, but it is not wonderful that the man who desperately clung to it, and never tired of preaching it, in season and out of season, as the last word of religious truth and wisdom, should have found himself out of harmony with almost every section of his clerical brethren. It is a curious coincidence that within the same week there should have passed away another representative dignity, differing widely in many ways from Dean Stanley—an old-fashioned high-churchman, a Conservative, a man of shy and retiring nature, and a bookworm, but also a man of deep learning, great kindness of disposition, and munificent liberality, to whom more than to any other individual

is owing the splendid restoration of Exeter Cathedral; we mean Chancellor Harington, who was loved by all who knew him, and revered, one might almost say, throughout the West of England. Mr. Stanley's departure leaves a vacancy which in one sense is not likely to be filled. But it may be hoped that Mr. Gladstone, who has already had to appoint a Dean of St. Paul's, may be able to find an occupant for the second London deanery, if not in all respects like his predecessor, at least equally unselfish and generous, and qualified to do justice to the capabilities of a position of unique historical, ecclesiastical, and national interest.

#### THE POLITICAL CYNIC'S HOLIDAY.

THE political cynic is a person who is in the present day exceedingly well abused. He is accused of regarding the universe through the windows of clubs, of disregarding the authority of the national conscience, of having no convictions, of being shallow, superficial, ill informed, an alarmist, a reactionary, a bad man in his private and a worse in his public character. The age, however, makes him amends—probably ample amends in his own opinion—by providing him with abundant game of the kind which he specially affects. Whether the folly of one period exceeds the folly of another is a problem which it would take a remarkably wide and accurate knowledge of history and a balancing apparatus of peculiar delicacy to solve. But that the folly of the present age is peculiarly suited for the peculiar kind of student in folly here considered there can be no doubt. A great deal more happens now than used to happen, and a great deal more of what does happen is known. The daily newspaper has its revilers, but it must be confessed that it has enormously increased the opportunities at command for the pursuit and discovery of that grand object of Mr. Carlyle's imagination, the foolishest man living. Almost every morning there is a fresh candidate for the honour, and it rarely happens that he is not an improvement. Just as the practised biologist makes endless progress in his investigations, and, after finding it possible to write an octavo about the leg of a fowl, finds it possible to write a folio on the drumstick of a lark; just as the earnest athlete is able, by practice, to beat his own achievements and those of others, so is it with the student of political folly.

A single instance will suffice to illustrate the proposition that the much-reviled nineteenth century is the political cynic's paradise. There have been we hardly know how many dozen or how many score debates on the Irish Land Bill, and scarcely one of them has failed to produce its text for the political Democritus to improve. Take, for instance, the other night's discussion on the names of the proposed Commissioners. The subject was not especially promising; yet Mr. Shaw and Mr. T. P. O'Connor managed to produce two gems of the purest water from their interior mines. "There was nothing more wanted in Ireland than money," said the member for the county of Cork; and the House of Commons, which, to do it justice, is not slow at a jest, greeted the statement with a torrent of laughter and cheers. But a few minutes afterwards Mr. O'Connor capped the confession by remarking that "what was wanted in Ireland was not law"; and again the obvious truth of the assertion was duly honoured. Now, of course, Mr. Shaw and Mr. O'Connor meant something very different from the meanings which the House laughed at and cheered. But, if they had put their heads together, and agreed to put in for a share in the reputation of the great witticism-makers of the world, they could not have been more fortunate in their description of the Bill itself, or have pronounced words of happier augury as to its success. If what Ireland wants is money, and what it does not want is law, then the wants of Ireland ought to be at least satisfied by Mr. Gladstone's measure. For that measure gives Irishmen a great deal of money; and, if it gives them plenty of litigation, that litigation is to be conducted on principles about as different from what has generally been regarded as law as anything that can well be imagined. Again, the House of Commons itself, the cheerful legislative institution, which is quite aware of all this, which laughs and cheers so as to clear itself from the charge of dulness, and yet votes as "straight" in accordance with Mr. Gladstone's will as if it did not see at all—this, too, is a pleasant spectacle. A hundred years ago the House might or might not have laughed; but, if it had its laugh, that laugh would have been somehow reflected in its vote. We have changed all that, just as we have changed the duties and conduct of Ministers. On the same day on which the two Irish members achieved their commendable description of the Land Bill and the wants of Ireland, Mr. Childers was exhibiting machine guns and other weapons of a war to a distinguished company. With his own Secretarial hand (at least so says the *Daily News*, which ought to know) Mr. Childers showed how easy the new howitzer was to work to a distinguished company of generals, colonels, attachés of foreign ambassadors, &c. It is some years since Mr. Childers amused the town by taking the command of the Channel Fleet. He has now completed his experiences of practical work in the defence of his sovereign and his country by acting as a gunner. Some foreign critics have been contemptuous of the Windsor Review; but this new proof of the efficiency of the English services ought, surely, to strike terror into them. It will be a bold man who ventures to invade England when he knows that the Secretary for War himself may pick him off with a machine gun. This illustrates, of

course, the thoroughness with which the present Ministry performs its work in all departments. Rude Irishmen have decorated Mr. Forster with an uncomely prefix to his name, but it would seem that "Howitzer" Childers is an even more appropriate conjunction than "Buckshot" Forster. The incident will at least assist the author of *The Happy Land* when he judges it proper to produce a second part of that popular drama.

On the whole, however, the speech of Mr. Goschen at Ripon is the most satisfactory study for a student of the kind we have in view that the present week has produced. Everybody respects Mr. Goschen, and most people are prepared to allow that he has done a very difficult piece of work much better than might have been expected. A speech to constituents, however, is always a trying matter, and Mr. Goschen has hardly come scathless through the ordeal, while his late colleagues and his party are wofully huddled. He is still, it must be remembered, unmuzzled; for his late duties were not definitely party employments, and he can say the thing he will. The thing he willed to say, about his private affairs and late employment, had its comic side. Mr. Goschen indulged in an almost sentimental reverie as to the last time he heard the clock strike in the Ripon Drill-hall. It was during the election, and Mr. Goschen "had plenty of fun and excitement." During the weary moments at Stamboul he has thought, he tells his constituents, of the blue posters of his opponent and of his own orange rosettes. We can conceive no possible reason why Mr. Goschen should not indulge in these chromatic reminiscences, though it seems unnecessary to mention them to an admiring audience. But a good deal must be allowed for the effects of sentiment at moments when the heart is stirred. Least, however, the men of Ripon should think that his recollection of the blue posters had been brought about by a fit of blue devils. Mr. Goschen hastened to assure them that the life of an ambassador has its pleasures as well as its drawbacks. The Plenipotentiaries at Constantinople seem to have been nearly as jolly as the members of that celebrated Congress of Cambray, where, as Voltaire remarked from ocular inspection, the Ministers of Germany appeared to have nothing to do but to drink the health of the Emperor, the Spanish Ambassador spent his time in directing a theatrical troupe, and the English envoys sent a great many couriers to Champagne, but very few to London. This last part of the comparison would be unfair to Mr. Goschen; for, according to his own account, he telegraphed to Lord Granville, and Lord Granville to him, with extraordinary volubility. But life was not all telegrams or ambassadorial discussion. Mr. Goschen and his colleagues played lawn tennis together, rode together, joked together—for some of them were men of wit—and they always dined together. A small ambassadorial dinner in the midst of a crisis is, it appears, Mr. Goschen's idea of the height of enjoyment; and, indeed, an ambassador crowned with roses and anointed with Burgundy while he is waiting for a telegram with orders to give the word for a general European war is a figure with much of the exciting and picturesque about him. Mr. Goschen, however, in these intimate confidences was not nearly so amusing as Mr. Goschen when he came to criticize what his colleagues, or employers, or whatever they are to be called, have been doing in his absence. Whether he was quite aware of the extreme candour of his own remarks we cannot say. The fact apparently is that these ambassadors get into such outspoken straightforward habits that, even when they cease to lie abroad for the good of their country, they cannot for the life of them practise what is unjustly called diplomatic reserve. Mr. Goschen's eulogies of the Irish Land Bill are qualified with the most energetic repudiation of any such doings in England. "We do not want," says he, and most Englishmen will heartily agree with him, "courts of law to decide between business men." "We do not wish to see the State interfering at every turn with our occupations." Moreover, the Land Bill is a measure "due to successful agitation"; and it is "a dangerous thing in the history of a country when agitation is successful." The Liberal party will have "to buckle to and work on the old lines, forgetting this exceptional legislation." Whether the Liberal party will be able to forget it, or will be allowed to forget it, is a point which apparently Mr. Goschen leaves out of consideration. But it would be difficult to find an odder spectacle in recent political history than this criticism of a distinguished Liberal politician on the home policy of a Liberal Government. They have been busily interfering with business, and he energetically protests that Englishmen do not wish their business to be interfered with. They have been deferring to agitation, and he tells them that successful agitation is a very dangerous thing in the history of a country; and that the best thing they can do is to forget all about it, and buckle to work on the old and very different lines. It is really to be feared that Mr. Goschen's former colleagues will come to the conclusion that he is a much nicer person when he is playing lawn-tennis and dining at Constantinople than when he is making speeches at Ripon.

This talk is, of course, the cackle, and these views the squint, of the wicked political cynic, to be duly reprobated and dismissed as such. The worst of it is that the political cynic has a horrid faculty of turning out to be a true prophet. It was the cynic who pointed out that the amiable Italomania of England in 1859 was simply disorganizing and upsetting the whole Continent; the cynic who suggested that the Reform Bill of 1867 would probably render the House of Commons useless as a legislative machine, and certainly lower the standard of the individual ability and respectability of members of Parliament; the cynic who laughed at the notion of the Irish Church Bill or the Land Bill of 1870 pacifying

or contenting Ireland. The wisdom of England went its way, in spite of the cynic, and still ignores altogether the remarkable fact that things have come about exactly as he said they would. The political cynic, however, is as a rule a very easy-going Cassandra. His prophecies of evil, when they are made, liberate his own soul, and if the majority choose to demonstrate the truth of a celebrated estimate of them, that is no business of his. There are times of course when such an attitude is immoral, and when it is the duty of man to die in the last ditch. But these times do not often come, and for the most part the modern Cassandra is perfectly justified in pointing out the pitfalls which men are digging for themselves, and then in sitting on the edge thereof, and deriving such amusement as may be from the general absurdity of their behaviour, first in the digging and then in the falling in.

#### CABMEN AS JOURNALISTS.

THE ancient Centaur was a fabulous animal—"heathen," Mr. Pecksniff would have been "sorry to say"—which haunted the mountains and watercourses of Thessaly. Further information about the ancient Centaur and agreeable pictures of him from authentic sources may be found in a learned article by Professor Colvin in the *Journal of the Hellenic Society*. But the *Centaur* about whom we propose to say a few words is not to be found in any such highly-cultivated periodical, being more conversant with public-houses and cabmen's shelters than with the mountain-ashes and waterfalls of Mount Pelion. The *Centaur*, in fact, is the name of the weekly organ of the cabdrivers, and an extremely respectable periodical it is, containing much information not elsewhere to be acquired. The world sees but one aspect of the cabman—the side of his character which he exhibits in the great struggle for life. There is a conventional theory which regards the cabman as scarcely more scrupulous or courteous than the ordinary land-lounger in Parliament. He is accused of bullying old ladies, and of refusing, with oaths, all offers of his lawful fare. No doubt there are cabmen of this sort, but, as a rule, they appear to be hardworking men, who have a decidedly rough life in the dust, rain, East wind, and violent heat of London springs, summers, and winters. It is rumoured that drivers of hansoms are a haughty race, and that though they do not disdain to meet drivers of four-wheelers at the club, the wives of those gentlemen never visit each other. Little light is thrown on this delicate question by the *Centaur*, which is now in its one hundred and twenty-second number. On the other hand, we detect a certain air of scorn when "shoufuls" are mentioned, and a "shouful" as some of our readers may be aware, is the technical name for a hansom. Omnibuses are certainly spoken of without much esteem. The want of ventilation in omnibuses, "which in a peculiar sense are distributors of disease," is censured with much severity, and the *Centaur* agrees with the *Lancet*, which "advises the delicate or susceptible to avoid these conveyances." The "susceptible" should certainly take this counsel, as the maidens who travel in omnibuses are fairer far than ordinary maidens are.

Perhaps the most interesting columns of the *Centaur* are those headed (we cannot guess why) "Carraway Seeds." "Carraway Seeds" are short paragraphs of gossip, written in the first person, like the paragraphs in the "Society Journals." Like the same productions, they are wonderfully original in grammar, though we have found nothing quite so remarkable in the *Centaur* as this extract from a journal of higher pretension:—"I fear that greatly as the surroundings of Goodwood has deteriorated of late years from its former comparative quiet, it has much lower depths in prospect." There is also in "Carraway Seeds" the familiar air of knowingness, and the rich acquaintance with the "gossip of the Clubs," which every one envies and admires. We quote, with a brief omission, a good example of the smart anecdote of the author of "Carraway Seeds":—

I was going to set down at the "Traveller's Club" the other day when I saw a person dressed like a gentleman get out of a four-wheel cab, walk up to a shouful driver who was sitting on his cab, outside the Reform Club, and demand his ticket. The driver said he had done nothing wrong and was getting rather warm. I told him to keep cool, told the person dressed like a gentleman that he could not legally demand the driver's ticket as he was not his fare, and was driving away when the driver said to me, "Do you know who that was, Gardner?" I said, "I can't call him to mind; his features are familiar though." "Why that's old ———" And so it was, too!

Next we have the affecting story of a footman, who, "feeling a great desire to have more freedom, set his mind on driving a hansom." The point of the joke is that the ambitious footman received a "four-wheeler bill," not a "hansom bill," from the police in Scotland Yard. Like many social narratives, the legend will only amuse those who happen to move in a somewhat exclusive circle. The style of another "Carraway Seed" is so neat, its wit so terse, that one cannot but hope the contributor will be asked to take even a higher seat than the perch of a hansom cab, and to become one of the young men who describe in the weekly press the entertainments of the nobility and gentry:—

Taking tea at Poland-street the other evening the most novel way of paying a cab fare I ever heard of was recounted; two miles paid for in the following coin—two threepenny pieces, one fourpenny piece with two holes in it resembling a shirt button, one penny, two half-pennies, two farthings, and good-day, cabman. What a nice party. A fit companion, I hold, to Mother Prodiges.

It has always been supposed that cab-drivers are not indifferent

to sport, and that they have a certain acquaintance with the good things of the Turf. But it may be less generally known that cabmen are "wet bobs," and maintain an annual regatta. The "Carraway Seed" about the regatta entirely puzzles us, partly because the anecdotalist, like so many of his species, does not write the ordinary English of mere literature, and partly because the allusions are delightfully mysterious and demand a knowledge of the best cab-driving society.

I understand the meeting at the draw for the 8th annual Pimlico Cabdrivers' Regatta. Father Townshend once said cab horse race was a success, and certainly from the appearance of the crews a first rate afternoon's recreation will be provided. I shall try to go out of my depth and spot the winner for my regular readers one of these days. I am glad to be able to record this eighth annual affair. I certainly was for years envious of the Lupus-street activity, but there can be no doubt in one's mind now that they really are responsible, and should receive credit for the present athletic revival; and I therefore do my best to give honour where it is due. I do trust that all who attend on the 22nd of August on the Embankment will do their very best to avoid any complaints of disorderly conduct by being as quiet as they can under the exciting circumstances that are sure to exist. Be sure and be present.

Here the isolated mention of Father Townshend at once allures and puzzles the uninitiated. Perhaps the "regular readers" know all about it, and understand why it is necessary for a writer to "try to go out of his depth" before attempting "to spot the winner." The best way for the curious to solve all these problems is doubtless to "attend on the 22nd of August on the Embankment," where, perhaps, Father Townshend himself will ride the winner in a cab-horse race. The circumstances, in that case, will be indeed exciting. As we learn, from another paragraph, that "the rowing club have arranged for their sports during the last week in August," while "we are not informed if rowing is to take place this year," the nature of the athletic diversions of cabmen seem, at first, extremely obscure. But there is yet another paragraph which clears the business up to a certain extent. From this we gather that the cabmen are swift of foot as athletes, but not fond of a long distance. There is to be a hundred and fifty yards handicap, open to all cabdrivers, which should bring together a large field. There is also a two miles walking race for all cabmen, an open mile race, and the entertainment is to close with a pig hunt, a diversion not yet introduced into the sports of the Universities at Lillie Bridge.

Turning from social gossip and from mere amusement, we are at once interested by a letter on the future of the four-wheeled cab. The author of this letter, though obviously a practical man, who has thought over four-wheelers in all their bearings, has a rather obscure style, reminding one now of Thucydides, and again of Tertullian. He begins with a statement sufficiently clear—"A fact that is experienced is that improvements are, in most instances, talked about for a very long time before the attempt is made." He goes on, as Mr. Paley says in his translation of Pindar, to "propose a subject for discussion." The question is, "What would be a suitable four-wheeled cab to meet the wants of the times?" "The want of genius is not lacking among drivers," he says; and, indeed, we are inclined to agree with him that drivers have a most plentiful lack of genius. But we do not look for constructive talent among them, and it is really for the coach-builder to secure immortal fame and a great deal of money by inventing a light, comfortable, and silent four-wheeled cab. The writer in the *Centaur* says:—"My idea of the cabs of the future may be wrapped in the word 'assimilation.'" That is, to make them as much alike as possible, to serve that purpose which is often inconveniently felt by the cry of "Where are the Hansoms," when there are dozens of four-wheelers at hand, and *vice versa*. This is not very intelligible. The writer seems to think that, if all cabs were made alike, each cab would serve all purposes, like the celebrated Delphic knife. Thus if a man wanted a fast cab to take him to a party for which he was late, he would have to drive in the same sort of cab as that which carries a large family, with luggage, to a railway-station. We gather that the writer in the *Centaur* expects small omnibuses to carry all luggage. He speaks fondly of "the dear little American twopenny," which is a vehicle (if indeed it be a vehicle) that we know not, at least by this caressing diminutive. "Whatever cab may be introduced, it must be well borne in mind, that its charm will be broken unless it is drawn by good horses." And unluckily its charm is not the only thing likely to be broken, if the cab be not carefully driven. The *Centaur* contains a harrowing account of the pinning of a four-wheeler between two tramcars. "The wheels were broken off, the iron twisted, and the body much splintered."

Though "by some it may be implied that the hansom is all in all," we agree with the *Centaur* that "a light, easy, silent, four-wheeled vehicle, suitable for cold, warm, wet, or dry weather," is a thing which the public has a right to demand; but the public has a right to demand a great many things which it is not likely soon to obtain. Meanwhile cabmen are interested, and their business, perhaps, is imperilled, by the "one-horse omnibuses" of the Railway Companies. Though these vehicles may interfere with the profits of cabmen, it is not easy to see what measure they can take to protect their interests. The *Centaur* keeps a very sharp eye on policemen, magistrates, and tramcars. About magistrates this journal speaks, we venture to think, without sufficient reverence. It is flippant to call a worthy beak "an irritable old gentleman." Cabmen should remember that, if the London magistrates were to publish a journal of their own, they, too, might say sarcastic things about the drivers of four-

wheelers and even of bansoms. It is a pity that the differences of private life should be introduced into journalism. With this exception, and though we must regret that the style of certain passages is not purer, we think the cabdrivers have every reason to be satisfied with their organ. It does not stimulate party feeling in politics, it avoids risky stories with scrupulous care, it gives instruction in the mild art of gardening, it publishes a novel, and comments on the fatal duel in which M. de Saint-Victor was slain. We confess that we miss a poet's corner. What is life without song, and is it possible that the poets of the rank are less musical than they whose notes resound in some weekly columns?

#### MR. JUSTICE CAVE'S SENSE OF SERIOUSNESS.

SOME years ago—how many we do not care to calculate—we were one fine summer's day bowling in a cricket-match. We sent a ball which ought to have been severely punished. But it chanced to light on a lump in the turf, suddenly rose, and, instead of being hit away, gave the luckless batsman a black eye. As he was withdrawing to the tent, the umpire remarked to us, with almost an air of enthusiasm, "After all, Sir, what gives the game its greatest charm is its glorious uncertainty." It is not only cricket, we have often thought since that, that can boast of its glorious uncertainty. There is, moreover, the glorious uncertainty of the law. We are not at the present moment thinking of the uncertainty which, owing to the infirmity of human intellect, naturally attaches to all cases where a conclusion has to be drawn from premises which are necessarily imperfect. Nor are we even thinking of the uncertainty that is so constantly introduced by the infinite variety in the characters and understandings of jurymen. We have solely in view the confusion that may arise from the appointment of a new judge. The uncertainty that one of these grave men now and then causes is sometimes glorious from the point of view of the criminal, and sometimes glorious from the point of view of the criminal's victims. In either case, the interest of the mere spectator, who is never better pleased than when he is surprised, is greatly increased. If he is by nature of a meditative turn of mind, he soon finds himself agreeably occupied in trying to trace the principle on which the judge has acted. Respect for the Bench has led him, of course, to assume that there is a principle, and to refuse to allow that it can with any reason be whispered of any of their Lordships, as of the stars, that in their circuit "they blindly run." It could be wished, however, that every new judge should be required to publish a statement of the principles on which he intends to administer the criminal law. This he should do with all convenient speed after his appointment, though it would be only proper that a suitable time should be allowed him to learn his own mind. When once he had issued his proclamation as it were, then the Circuits that he was to go should be laid down at least some two or three years in advance. For if, as Bentham and those who follow him maintain, the certainty of punishment is far more efficacious in restraining crime than the severity of punishment, surely those who are likely to be tempted into crime ought to be informed, before they take the first step, of the penalty that awaits them. The profligate are by their nature hopeful, and great bo-liers in their own luck. The first aim of society should, therefore, be to raise in them the habit of prudence, and to convince them that the various forms of crime will be invariably followed by fixed penalties. Now prudence is not a habit that can be taught all at once. It will be something if our criminals are converted and raised from imprudent into prudent criminals. It will be something, for instance, if a man who has a strong and ardent desire to jump on his wife and to throw her into a canal, or to stick a shoemaker's knife into a lady and to knock her teeth out, can be taught to restrain himself for six months till the time has arrived for a lenient judge to hold the assize. In a court of law least of all places should a man as he is sentenced have good reason to curse his luck and his Lordship at the same time. In that solemn temple of justice no ruffian should know that the part of his crime that is most severely punished is the fact that he was either a week too early or a week too late in half murdering his victim. It seems scarcely fair even to the philosophic mind, while it must seem grossly unfair to the mind of Bill Sikes and his friends, that a man should be far more severely punished for his judge, as it were, than for his offence. Yet we might well conceive how two convicts, when they came in prison to talk over their fortunes, and found that their crimes were the same, but their punishments so unequal, might be at a loss to discover anywhere but in their judges the explanation of the inequality of the suffering that had come upon them. "We both," one might say, "went as near the gallows as we dared. It was more our luck than our merit that we did not each of us murder a woman outright. How comes it, then, that my back is all scarred, and that I have ten or twenty years of penal servitude before me, while you have never had even one stroke of the cat, and in a short twelve months will be a free man and ready to half murder, or, for the matter of that, wholly murder, any one whom you please?" "It is all along of the judges," his friend would surely have to answer. "If a man has any luck in his judge, he need not trouble himself about one or two kicks more with a heavy boot in any one's stomach, be it man, woman, or child."

Into such a train of thought have we been led by some sentences that have just been passed by Mr. Justice Cave at the Staffordshire

Summer Assize. To thoroughly enter into the humour of these sentences we must contrast a few of them. Thomas Harper pleaded guilty to feloniously stealing a bushel of malt. He was sentenced to fifteen months' imprisonment with hard labour. Likely enough the punishment was not a whit too severe, for the man may have been an old offender. Nevertheless, from Harper's point of view, it is a great pity that he had not last 3rd July left the malt alone, and spent his time in assaulting his wife. In that case, in less than a month from now he would be out of prison, in the full enjoyment of his liberty as a man, and his rights as a husband, while he would be strengthened and refreshed for a second assault on his better half. As he reflects that for a whole year and a quarter he and malt must be parted, he must surely regard with envy and admiration his fellow-prisoner, Frederick Goldsmith. This man, who, so far from having to steal malt, was a maltster himself, was indicted at the same Assize for attempting to murder his wife. "On the evening of May 2," according to the report of the trial as given in the *Birmingham Daily Post*, "the prisoner and his wife and daughter were walking on the canal side, when the prisoner was seen by two boys to push his wife into the water and, then jump upon her. She was assisted out of the water by two young men, and she said, 'It is my own husband; he's tried to drown me.' Evidence was also given as to a quarrel occurring between the parties a few days previously. The prisoner's wife, however, on being called, declared that she fell into the canal and her husband pulled her out. He was then indicted for an unlawful assault on his wife, and found guilty. Prisoner was sentenced to one month's imprisonment with hard labour."

If the report of the trial is trustworthy, it is impossible to understand the leniency of its sentence. The evidence of a wife in such a case is, as every one knows, worthless. In any case, whether Goldsmith tried to murder his wife or not, it is clear that the assault was of an aggravated nature, and not one that requires to be multiplied by fifteen before it is raised to the enormity of the theft of a whole bushel of malt.

If Goldsmith has good reason to bless his stars and his judge, no less grateful should be one Albert Lowe, a hawker, who was tried before the same judge on the previous day. This ruffian was indicted for feloniously assaulting and robbing the wife of a medical man. He had attacked her when she was walking in some fields at Edgbaston. He had seized her by her throat, struck her many blows in her face, knocked out one tooth, and injured other teeth, stabbed her twice in the arm with a shoemaker's knife, and thrown her into a hedge. He had stolen from her her purse, containing nearly four pounds. At his trial he could make no defence, and he, therefore, pleaded guilty. "His Lordship," so the newspaper report runs, "said the prisoner had been guilty of a most violent assault on a lady, causing her much injury, and he should mark his sense of the seriousness of the case by sentencing the prisoner to twelve months' imprisonment with hard labour." It must surely be the case that Mr. Justice Cave is, as yet, so unfamiliar with his powers that he does not bring home to himself how far they extend. We call to mind the story of a sailor who had suddenly come into a large fortune. He was supplied with a cheque-book, and told how to draw on his account at his bank. After a few days' hesitation he boldly drew a cheque for five pounds. "There's a sweater for them," he exclaimed, as he printed his signature. "There's a sweater for you, my man," no doubt thought to himself the worthy judge as he gave this murderous ruffian a whole year's imprisonment. But, then, how about Thomas Harper and his fifteen months for his bushel of malt, and how about one Ernest Warren who on the same day was sentenced to eighteen months for obtaining money by false pretences? Was Mr. Justice Cave marking his sense of the seriousness of each of their cases, or was he merely showing his want of sense by following in the steps of those judges who attach a greater sanctity to property than to life? No doubt he is a tender-hearted man, and does not willingly inflict pain. Likely enough, as he rated the ruffian and enlarged on the enormity of his guilt, his indignation melted away, and he began to doubt whether he had not already been too severe. We have heard of a magistrate who would begin by storming against a prisoner as the most guilty wretch he had ever had brought before him, and one whom he was determined to punish with the utmost severity, and who would end by fining him one shilling. Such men should, to use Fielding's words, learn to restrain the impetuosity of their benevolence, and should carefully select the objects of their passion. They should remember that a single weak sentence, as well as "a single pardon granted *ex mera gratia et favore*," is a link broken in the chain of justice, and takes away the concatenation and strength of the whole." By such sentences as those just passed at Stafford the chain of justice is indeed strained—ruffians have confidence given them, and honest folk are struck with timidity. It is but a very slight source of comfort in the midst of such a state of affairs that Mr. Justice Cave's sense of seriousness is clearly marked.

#### TROPICAL LONDON.

A SENTENCE from one of Theodore Hook's novels was extensively used during last year. Speaking of Scotland, he said the summer there had "set in with unusual severity." The severity of the season was not mitigated by the recollection that the summer before was even worse. Some people averred last year that they could remember two or three days in London

without any rain, but nobody could say even so much for the summer of 1879. This year the fine weather, which we should have so much preferred in instalments, has come upon us in the lump. The summers of three years were boiled—perhaps it would be more correct to say roasted—into one; and the question stated every morning in the daily papers is not "Have we had tropical weather?" but "Have the tropics ever such weather as ours?" According to Mr. Symonds, who has kept a register since 1857, not only has the heat been greater than at any previous period in his experience, but it has been greater than during the whole summer of 1880 in the Gaboon on the West Coast of Africa. St. Swithin's Day, in fact, was signalized by a thermometer which rose in some places to within four-tenths of a degree of 95° in the shade. So far back as 1847, on the eve of St. Swithin, 98° was registered at Uckfield, in Sussex; but it may be fairly contended that thirty-four years ago the thermometer was not precisely the same implement that it is now. Perhaps the most curious, and certainly to many people the most important, part of the case is the failure of the Weather Office to foresee the long continued and excessive heat. It was evident, day after day as the Meteorological Report came out, that the "Clerk of the Weather" regarded, not the face of the sky, but his own instruments. "I can always tell," said a shrewd country farmer—"I can always tell by the weather what my barometer is going to do." People with a very moderate amount of weather wisdom were able to predict with great certainty the heat and sunshine of several days of which Mr. Robert H. Scott wrote his prognostication very doubtfully. Thus, on Tuesday the 12th, we were told to expect "perhaps thunder and rain"; the wind was backing, and the afternoon was to be "less settled." This cautious prophecy included almost every possible chance except one. Had it rained, had it stormed, had it hailed, or thundered, or lightened, the prediction would not have been wholly falsified. In the result, the only contingency for which Mr. Scott had not provided actually occurred. The day was cloudless, settled, and very sunshiny and hot. On Friday, again, the hottest day of all, the forecast was very similar to that of Tuesday, but more decisive as to probable thunder. On Saturday, seeing the heat of the previous day had not been exceeded in the memory of a whole generation, the forecaster, with every probability in his favour, ventured to promise it would not be so warm:—"Cloudy, thundery, showery, cooler than to-day." This latter part only of the whole forecast turned out correct. Monday was to be very unsettled. It was to be much cooler, wet, and perhaps thundery. A lovelier day than Monday turned out it would be impossible to conceive, though the heat continued excessive and the thermometer reached 88°. It is impossible not to commiserate Mr. Scott in weather which persistently refused to do as it ought, and, so to speak, went on "continuing fine." He had the weight on his mind of having prophesied falsely, and he had the excessive sultriness to endure like the rest of us. On him, in short, must have fallen in an eminent degree the burden and heat of the day.

Even more disappointing than the Clerk of the Weather has been the conduct of the Water Companies. When to the heat of the Gaboon was added the dust of Sahara, Piccadilly became indeed unfit for human habitation. It is difficult to find any mitigating circumstance in favour of a monopoly which is willing and ready to water the streets in wet weather, but fails to water them in dry. Last summer and the summer before any one who went to the trouble of providing a cistern and filter had excellent rain water and to spare. This year the cistern is dry, and it is just at such a conjuncture that the Companies fail us. It should be clearly understood that the failure is not due to want of water. It is due to the neglect of the Company to use sufficient pumping power. The water is there in abundance. There is no sign as yet of drought in the Thames. That may come later. Simultaneously with the report of Lord Powerscourt's complaint in the House of Lords, a gentleman, who has seemingly peculiar views as to the duties of the Water Companies, writes from the House of Commons to the morning papers, urging "the inhabitants of this great metropolis to make more sparing use of the water now supplied to them." The grounds on which this extraordinary request is made are that "the resources of the Water Companies are now taxed to the utmost." We are begged to consider the feelings of the poor dear Water Companies. Their resources are taxed. It is indeed sad. Of course some inconsiderate but cleanly water consumer may be found who has no sympathy for the Water Companies. "If their resources are insufficient why don't they increase them?" is his heedless question. But even Water Companies are our fellow-creatures. Though we remember that but for the constant exertions of the sanitary authorities, they would poison us all to-morrow morning, and that they pay a handsome dividend on their monopolies, still, in such weather as this, even a Water Company may be forgiven for feeling a little languid. Had the M.P. put it to us for the sake of our neighbours to abstain from excessive ablutions his appeal might have had more weight with people who think "Boards have no bowels." The remedy against a Water Company which fails in keeping its contract with the public is fully set forth in a speech by Lord Carrington, who said that the Local Government Board could take cognizance of complaints of short supply for domestic use upon a memorial signed by "not less than twenty inhabitant householders paying rents for, and supplied with, water by the Company." It is not easy to make sense of this extract, but the drift of it is plain enough. Every possible

obstruction is placed in the way of obtaining any remedy against a Water Company. But it does not appear, at least Lord Carrington did not explain, how the twenty householders could complain of not being supplied, when the Act, as quoted, states that every one of the score must be a person who is supplied. If he is supplied why should he complain? This ingenious enactment for the protection of Water Companies must have been made when the House was very full of members who shared the benevolent feelings of the writer of the letter in Wednesday's papers.

The general aspect of London during the hot weather has been interesting and unusual, if not picturesque. In the park, ladies and gentlemen in pith helmets watched from on horseback the distant gambols of the bathing boys, while the police took upon themselves to forbid the Serpentine to bathing girls. Here, but for the weather, would be a charming grievance for the advocates of women's rights. But even men find it hard to make unusual exertions, and though the philosophers may find heat a mode of motion, it supplies in its recent form a still greater motive for repose. The Land Bill hangs limp and flaccid from the hands of perspiring legislators. Curiously compounded drinks are everywhere advertised. We must spare what the Water Companies supply, but we need not spare mineral waters. As it was when the people clamoured for bread and the little princess offered them cake, so now, we are permitted without interference to patronize the Apollinaris Company or the St. Galmier Company, as if we did not buy and pay for the water brought to London by the Grand Junction or any other of the monopolizers of our supply. The cavalry charges at every horse-trough add a new terror to our streets. Railway porters and potboys go about with Japanese fans. Drivers protect their heads with green cabbage-leaves. Young ladies wear lovely pink gowns, and the muslin shops have exhausted their summer stock. For four years past "prints" have scarcely been seen in the streets, but this year every second woman displays in her dress one of Mr. William Morris's latest scrolls. Washerwomen are coining, but fishmongers are in despair; were it not for the ice trade, they might close their shutters. Every one complains, "yet who would live past years again?" People who have nothing to do have no excuse if they cannot enjoy the pleasures of a season in which rain has marred no picnic or flower show, postponed no review or coach parade. On the other hand, people who have to work display an unusual irritability of temper. Libel cases are frequent. The quarrels of authors, and still more the quarrels of authors and publishers, are everywhere heard. The farmers, too, will have cause to grumble in all probability, however the weather may turn out now; for the fineness of the past few weeks has kept their crops from growing, and rain will prevent them from reaping even what they have. But the exceptional weather has been strictly local. In the North there has been little of it. It is only London and its suburbs, in fact, which have become so unexpectedly tropical.

#### NAVAL ENGINEERS.

AS is well known, the engineers of the Royal Navy have long been discontented; and it is to be feared that they are now more discontented than ever. A statement of their grievances made in a somewhat irregular form has recently appeared, as a collection of speeches and newspaper articles setting forth and discussing their complaints has been published at Plymouth. It is much to be regretted that the engineers have not adopted some better means of making the evils they suffer from known to their fellow-countrymen. A fair and temperate statement of their case, drawn up by a writer acquainted with the subject, would have been far more likely to attract attention and carry weight than a series of articles for the most part from provincial newspapers, and marked in some cases by vehemence and exaggeration which can hardly fail to injure what, on the whole, appears to be a good cause. Not a few of the articles which the injudicious compiler has inserted might well have been left out, and information which is wanting might well have been supplied; for in the indictment which in this peculiar fashion is laid against the Admiralty there are faults of omission as well as of commission. One of the first inquiries which suggests itself with regard to this question is whether the engineers, who complain so bitterly of their lot, are worse off than the engineers in other services, and whether they claim no more than is conceded to the officers who in foreign navies are charged with duties similar to theirs. No such comparison as might be expected is, however, to be found in their ill-compiled pamphlet; and it is weakened by another omission which is almost equally remarkable. First amongst their grievances is the smallness of their pay, and they would go far towards proving their case if they could show that they are worse off than their brethren in the merchant service; but here again the pamphlet is silent. If the engineers are in as good a position as those of the American, French, and German navies, and if their pay is as high as that of the engineers of the Cunard, the Royal Mail, and the P. and O. Companies, the inference against the justice of their complaint is strong. If, on the other hand, they are not treated as well as the officers in other services, and have lower pay than officers in our own merchant service, it is clear that they have been very hardly used; and it is certainly equally clear that there has been great negligence in not laying these facts before the public.

Putting this portion of the question aside, however, and turning to such information as is contained in the pamphlet, it must be said that, badly arranged and incomplete as it is, it still gives good reasons for assuming that the engineers have real ground for complaint. In the debate on the Navy Estimates this year Sir T. Brassey and Mr. Trevelyan alleged that a great deal had been done for engineer officers of late years. No one can for an instant suppose that either of these gentlemen would state what he did not believe to be perfectly true; but in this matter they must have been misled, as, unless there is gross and monstrous perversion of facts in the pamphlet, very little has been done for engineers except in the way of removing temptation from their path by reducing their scanty pay. In order to show how they have been treated in this and other respects, it is necessary to state briefly what the course pursued with regard to their claims has been. In 1875, in consequence of complaints of long standing respecting the position and pay of engineers, a Committee was appointed to consider the question. At this body some sneers as puerile as they are vulgar are levelled by one of the writers whom the engineers quote. The feeble sarcasm is quite out of place, as there seems to be every reason for assuming that the Committee was an excellent one, and that its members were animated by a sincere desire to make such concessions as were compatible with due regard for the public interests. In their Report, which was made in January 1876, they stated that, in their opinion, the amount of pay the engineer officers received and their prospects of promotion were insufficient, and recommended, of course, that there should be higher pay and quicker promotion, and also that the engineers' separate mess should be abolished, that a cabin should be provided for the two senior men when practicable, and that engineer officers should be classed with the military or executive branch. In 1877 effect was seemingly given to the first two of these recommendations, as the pay of the engineers was, according to the Admiralty statement, raised, and their rate of promotion quickened. This, no doubt, constitutes what Sir T. Brassey and Mr. Trevelyan call "a great deal"; but the concession appears to have been purely nominal, as, if the facts are correctly set forth by the advocates of the engineers, these unfortunate officers are practically worse off now than they were before the Committee was appointed. We take the following comparison from the *Western Daily Mercury*, a paper which has supported the engineers' cause with needless effusion of rhetoric, but is doubtless quite correct with regard to figures:—

In 1863, an Assistant Engineer on entry received 6s. per day; in 1881, the pay is the same. In 1863, with an average service of eleven years, an Engineer Officer received 10s. 6d. per day; in 1881, with the same, he receives 10s. per day. In 1863, with seventeen years' service, 13s. per day; in 1881, 11s. In 1863, twenty-two years' service, 15s. 6d. per day; in 1881, from 13s. to 14s. In 1863, twenty-six years' service, 18s. per day; in 1881, 14s. to 16s. In 1863, thirty years' service, 20s. per day; in 1881, not all, but very many, serving on under the present regulations until they complete that number of years' service, will receive only 16s. or 17s. per day. If figures are of any value, we have now conclusively proved that the "great deal" which "has been done for the Engineer Officers of late years" has only resulted in leaving them actually worse off in 1881 than they were eighteen years before.

Certainly the writer seems to succeed in proving that the last state of the engineers is worse than the first, and it is to be observed that what he alleges is in part confirmed by another statement given in the compilation, and by the significant fact that the sum asked for the engineering branch in the present financial year is less by 72,700*l.* than it was fourteen years ago. With regard to promotion, the engineers appear to be better off than they were at one time, as in 1877 the chief engineers who were appointed had for the most part served twenty-two years. The period of service has since dropped to sixteen years and a half, and now stands at eighteen and a half; but it seems that there are reasons for fearing that the period of twenty-two years will soon be reached again, and even surpassed, unless some necessary changes are made; and it is not unlikely that, if things remain as they are, the average age at which the rank of chief engineer will be attained will be forty years. Then the peculiar method in counting years of service which is followed appears to bear most hardly on engineer officers. The result of this is partly shown by the rates of pay set out above; but it is well to quote the description of this extraordinary system which the Plymouth paper gives, as, if accurate, it proves conclusively how shabbily engineers are treated. An engineer, it is assumed, enters the service at the age of twenty-one years and a half, and, after nineteen years' work, becomes a chief engineer at the age of forty years and a half. Then his service is counted in the following manner:—

As soon as an Engineer is promoted to the rank of Chief Engineer, he is allowed to count two years of his junior service towards the first increase of pay—the first increase being given after five years' service; consequently he has to serve three years after promotion, before he gets any increase of pay. That is to say—if promoted at 40½ years—his first increment of pay as Chief Engineer comes to him after twenty-two years' actual service, at 43½ years of age. The increase of pay then given is 1s. per day, or 18*l.* 5s. per annum. He now serves on for a further period of two years, when, having completed five years' active service as Chief Engineer, he is permitted to count the other two years of his long junior service, and gets another shilling a day at 45½ years of age. And so, by small increments, he goes on counting another year or two of his junior service. But it is not until he has completed eleven years' active service as a Chief Engineer that he is allowed to count all his junior service. In other words, until he reaches the age of 51½ years, and has completed a total service of thirty years, he is deprived of all benefits of his junior service, save the very inconsiderable period of six years. The remaining thirteen years are of no value to him until he is 51½ years of age. In citing this case, we have supposed the officer in question to be serving on continuously without any

half-pay time; which is, of course, impossible. But if we add only the very moderate period of eighteen months' half-pay time to the above, it brings this officer's age up to 53 years, or just two years before he will be compelled to retire. Now, as he will only then have attained to the maximum pay of his rank, it follows that he will only enjoy it for two years, since he must retire at 55.

This system is so unjust and at the same time so elaborately ridiculous that it can only be regarded as an official device for keeping down the pay of engineer officers, and it appears to be a device as clumsy as it is contemptible.

With regard to pay, then, the engineers have a very real grievance unless it can be conclusively shown that, whatever the objections to the system followed may be, its practical result is to give these officers better emolument than they would receive in foreign navies, or in our own merchant service. With respect to promotion also the engineers have some ground of complaint, and it appears certain that the two principal recommendations of the Committee of 1875 have not really been complied with, and that the word of promise has only been kept to the ear. With the other grievances of the engineers, however, it is more difficult to sympathize, albeit they are pronounced legitimate by the Committee. One of their demands is that they should be classed with what is rather absurdly called the military branch of the profession, and not as at present with the civil branch, though they admit that they should belong to the category of officers who cannot under any circumstances take the command. This demand seems not altogether unreasonable; but nevertheless, if granted, it must be granted with careful conditions, as otherwise engineers, though precluded from command, may claim to give orders to junior officers, and it would be insufferable for an officer of the executive branch to receive commands from an engineer. The demand made for cabins for the senior engineers appears to be a just one; but unfortunately those who make it overlook the fact that neither the Admiralty nor any Committee can alter the size of existing war ships, and that, if there are no cabins for engineers, engineers must needs do without cabins, excellent and deserving officers though they may be. With regard to another demand of the engineers it is difficult to feel strongly, although it has been the subject of much rhetoric, and has now, we believe, been silently granted. They have complained very bitterly of being obliged to have a separate mess, and of their exclusion from the mess of the other officers. It is with the greatest reluctance that we touch on any question of "social status," but in this case it cannot be avoided. It must be remembered that the manners and habits of those with whom a man associates daily very greatly affect his comfort, and that there is no intimacy so close as that of a naval mess. Naval officers are not given to nonsense, and on board ship there has never been affectation and silliness such as have occasionally been shown in the messes of fashionable regiments. In all probability, therefore, if naval officers object to the society of engineers, they have good reasons for doing so. Why should the latter so much dislike living together? At present their contention appears to be that they have a strong objection to associating with each other, and, therefore, ought to be allowed to associate with other people.

Their demand has, however, been made with great persistency, and has enlisted a certain amount of popular prejudice, so it is not wonderful that the Admiralty should have given in. Their other two principal demands are, as we have endeavoured to show, based to all appearance on justice, and it is greatly to be hoped that they may receive serious attention, as it is most painful to think that meritorious and hard-working officers are inadequately paid and too slowly promoted. If, however, these just complaints do not receive attention, and if the engineers desire to keep their case before the public, they must endeavour to get that case better stated. They have excellent advocates in Parliament, and outside they ought to find some one who can do more than string together newspaper articles containing no small amount of nonsense.

#### WALKS IN ENGLAND.

UNDER the above title the current number of the *Quarterly Review* has a short paper intended doubtless, and not ill calculated, to lighten the mass of its more solid articles. According to the odd *Quarterly* fashion, a rather heterogeneous list of texts is accumulated, including work as old and as well known as that of Mr. George Borrow and of the late William Howitt; but the immediate subject of discourse is Mr. Jennings' recent and pleasant volumes. Walks in England, however, is itself a more inviting subject than anything that a *Quarterly* reviewer—the lightning wit of the reader may add, or a weekly one—can say concerning it. Some one or other is always taking up his parable about it and urging his countrymen to make themselves acquainted with their country, and yet the advice is apparently very slow to be taken. Most men of ordinary vigour have (generally, perhaps, in their undergraduate state) undergone a pedestrian fit of a more or less acute character; but it soon passes, and even while it lasts the range of exploration is for the most part limited and conventional. The Lakes, North Wales, the Isle of Wight, Cornwall, Devonshire, and Derbyshire almost exhaust it. The walker, too, is apt to be too much cumbered about his "record" and much too rigid in the observance of the programme which he may have set himself. At nineteen it seems base to acquiesce in twenty miles when an average of thirty has been planned, or to sleep at

Penzance when "the first and last inn in England" is down for the night's resting-place. At this time, too, walking tours are apt to be taken in company, which is a very decided mistake, if only for one simple reason. Although it is probably the most harmless stimulant known, walking is a distinct stimulant, and he who uses it goes through all the variations produced by other "intoxicants." He is hilarious, contemplative, melancholy, all by turns. Now it is impossible to ensure the coincidence of these states in any two or more individuals, and the want of coincidence is too often fatal to harmony.

The wiser mind then, when it has outgrown its salad days, does not cease to walk, but alters the conditions of walking. The knapsack remains something of a necessity, but it is only an occasional necessity, and the mature pedestrian will almost certainly supplement it with a portmanteau, accessible by help of railways and cloak-rooms. He will also, as has been hinted, be absolutely destitute of shame in the matter of miles accomplished and contemptuous of pedestrianism as to the observation of routes and stages. If the whim takes him he will walk forty miles on end, and if the whim takes him he will not walk four. In the choice of routes, too, there is a great difference between youth and age. Crack scenery and famous sights are not a chief object with what a recent writer has beautifully called the "wise adult conscience." The wise adult knows by experience that Lord Dalling's memorable saying about love is applicable to landscape. If you put a warm plaster on your body it grows colder and colder, till it gives you a mortal chill; if you put a cold one, it warms to your own temperature, and strengthens and refreshes you alike. The peculiar exhilaration or intoxication of walking is stimulated too much by a long day's walk of varied beauty, and the reaction is proportionately great. But, on the other hand, the average scenery of an English county is precisely that which suits the walker who is in or who approaches the silver age. We have walked (not in the ghostly sense) more or less in every one of the forty counties of England, with perhaps some four or five exceptions, and, putting the Fen district out of question, we hardly know a single one in which there is not to be found space for wanderings full of delight and capable of being made to last from a week to a month, according to circumstances. Absolute flatness is the only fatal quality, from the pedestrian point of view, because of the monotony it entails; and absolute flatness is almost unknown in England, save in the one district just mentioned. Elsewhere, it occurs only in patches easily passed over by the help of the railway, and bordered on all sides by the broken ground which the walker loves. For instance, let us take almost at random on the map three counties, neither of which has any particular reputation for the picturesque—Northamptonshire, Norfolk, Dorset. None of these can be said to be among the English show counties, yet the least remarkable of them—Northamptonshire—will give any one walking ground of the pleasantest for a good fortnight, in the Nene Valley, the most characteristic, perhaps, of the smaller English straths, in the great parks and woodlands of the old district of Rockingham, in the high rolling downs which stretch between Naseby and Towcester. As to Dorsetshire, it is, perhaps, in a small compass the most representative of southern English counties. Between Lyme and Sherborne scenery of the kind popularly associated with the name of Devonshire occurs such as Devonshire itself can only provide on a greater scale; while the downs of the east are equally characteristic, and the coast-line presents at Lyme, Portland, and Purbeck, curiously independent beauties. As for Norfolk, it boasts not without reason of its variety. The Broad district is a thing unique and without parallel, at least in this island. No one who has seen it at the end of May or in the beginning of June, with the rivers and broads one mass of water-lilies, the marshy ground ablaze with yellow iris, the broken wooded uplands that rise between the various chains of lakes festooned with dog-roses, and the black sails of the wherries floating in misty sunlight (their hulls invisible) across the fields, is likely to deny its beauty. But the rest of the county, even without its extraordinary wealth of architectural interest, would be admirable walking ground, and with that wealth is still more admirable. Few people think of reckoning among the sights of England the walk from Castle Rising to Castle Acre, with its wonderful prologue and epilogue of Norman architecture; or the *détour* from Aylsham to Cromer, with four of the most interesting private houses which, putting the great show places aside, England can show, Blickling, Mannington, Barningham, and Felbrigg, or the journey from Thrapston down the Nene through Dryden's country to Fotheringay, or that from Yeovil through Sherborne and Blandford to Wimborne, with two great minsters and an unsurpassed panorama of English scenery on the way. Yet they are all easy day's walks, all within a hundred miles or a little more of London, and can all be supplemented almost indefinitely, according to ability and inclination, by other walks in the same neighbourhood.

These are merely examples, but it may be said generally that any one who makes up his mind to take a single English county yearly (four or five at the outside being excepted), and to walk about it for any time, from a week to six weeks, in the manner we have here in view, has, the gods being propitious, his soul's and his body's health secured for a pleasant vista of five or six and thirty years. Yet it must be acknowledged that it does not happen to every one to be such a walker. The capacity of enduring and enjoying solitude is perhaps not an absolute necessity, but it is very nearly a necessity. The walker must not be cumbered overmuch about meat and

drink. Fortunately, however, a certain drinkable ordinary claret ("the very best claret," as an ingenuous waiting-maid not long ago replied to inquiries about its nature) can generally be obtained now as well as plain meats, infinitely better than the pretentious and badly-cooked *table-d'hôte* food of the tourist routes. It will often be found, too, that fifteen or twenty miles a day restore in a marvellous fashion the capacity of consuming beer, bread and cheese, eggs and bacon, and other things impossible to the sedentary liver. The leisurely manner of travelling recommended, which hurries not to get up early in the morning, and scorns not to take rest early at night, will not leave much time hanging on the hands. The infantine state of fallowness in which the general regimen leaves the brain causes it to eschew severe food, and to rejoice in the advertisement sheets of country newspapers, in old *Gazettes*, and in copies of G. P. R. James presented to the landlady thirty years ago. Yet we have known a good deal of solid reading done in leisurely journeys of the kind, with the aid of the accompanying portmanteau. If the walker be a person accustomed to literary work, he will, as he walks, find himself composing poems, essays, and other works of remarkable brilliancy, which, if he be wise, he will allow to vanish utterly from his memory. The brain amuses itself with these things, and resents their being solemnly recorded. But for real enjoyment he will depend on the past. He will have read up his county as thoroughly as he can; and, if he be the sort of person we suppose him to be, hundreds and thousands of memories will associate themselves with the things he sees. No one who lacks these associations can properly enjoy occupation of the kind proposed to him. The woods of Rushton are commonplace trees to him who does not remember how "the lady of the spotted muff" talked to her milk-white companion, if all tales are true, for the first time in their shade. North Walsham ceases to be a very ordinary and sleepy little market town when one thinks of Bishop Spencer first discomfiting his rebel antagonist with a very great slaughter, and then hanging him out of hand, but duly accompanying him to the scaffold out of respect for his misfortunes and Christian care for his soul. We have not the least idea in what part of Dorsetshire Berry Hill was situated, but there are plenty of villages which are pleasanter to look at or to pass through for the thought of Evelina and her dreadfully prosy guardian. What with poems of places and prose about places there are very few days' walks in broad England which have not historical or fictitious associations in plenty, if only the traveller be ware of them.

Such walking as that now discoursed of may be said to deserve far better than the catching of fishes the title of the contemplative man's recreation. That it is possible to a great many people who do not attempt it, and who might attempt it with immense advantage, is certain. It is not in the least needful to be able to do forty, or thirty, or even twenty miles a day; ten or fifteen for a thoroughly hard-worked person of sedentary habits is perhaps the best allowance, at any rate at first, though it is astonishing how old faculties revive. As for guides, Murray is still hard to beat; and for the pocket nothing can be better than the series of county guides which Mr. Stanford has for some time been publishing. Of the maps attainable the less said the better; but, as successive Ministers have proved that England is too poor to get herself decently surveyed in any time not long enough to allow the first part of the survey to become obsolete, there is no use expostulating on that matter. Fortunately, too, in all the Southern and Midland counties, and in some of the Northern, a civil and direct answer to a civil and direct request for guidance can be depended upon, and the wanderer will seldom undergo the painful experiences of a traveller in the Highlands, where nobody will give a direct answer at all, or in Ireland, where the answer probably has not the remotest connexion with the facts of this prosaic universe.

#### LONDONERS AT THE SEA.

THOUGH London, with its noise, smoke, and bustle, is the biggest agglomeration of houses on the globe, its citizens have reason to congratulate themselves on its situation as well as on its prosperity. For it is the only one of the great Western European capitals which is within easy reach of bracing sea air. The inhabitants of Madrid and Berlin are simply so many prisoners at large, condemned through the dog-days, and for many sweltering weeks before and after, to the *peine forte et dure*, with but slight temporary relief. The plateau of Madrid is as hot in summer as it is cold in winter, which is saying a very great deal; while Berlin stands encircled by sandy wastes, enlivened here and there by scrubby fir-woods. Should you seek to escape from Rome to Civita Vecchia or Ostia, it is merely a change from the frying-pan into the fire, and the Roman sea-coast in many places is a trifle more malarial than the Campagna. Paris and Vienna are charmingly situated, no doubt; and there are enchanting sylvan retreats in the picturesque valleys that lie among the well-wooded spurs of the Austrian hills. Yet it may be questioned whether the overworked constitution is greatly refreshed by sipping wine on the sunny *côteaux* overhanging the Seine, or by draining glass after glass of beer in the still warmth of the woods of Moding or Baden. Besides in Paris, as in Vienna and most of the great Continental cities, there is one very considerable drawback to the easy enjoyment of flying holiday-makers. Almost all of the railway Companies have

their stations on the outskirts of the towns, and not the least fatiguing part of the day's work is the establishing communications with the point of departure. We may abuse our London Boards of Direction, but we must own that we have cause to be grateful to their enterprise or public spirit. Cannon Street or London Bridge is but a step or so from the heart of the City, while Broad Street, Fenchurch Street, and subsidiary stations serve as outlets for the population in the regions of the Far East. And the rival lines can hold out competing attractions, some of which must be very accessible to some section of the metropolis. Spirited open-air scene-painters have done their utmost on boardings and gigantic advertising boards to reproduce, in a blaze of colouring, the seductions of marine paradises. There are the white cliffs and the blue sea, the shining sands and the magnificent promenades, with the hotels and the less pretentious houses of entertainment that throw open their hospitable doors to all comers. Generally a gentle breeze is depicted as just dimpling the smiling surface of the ocean and swelling the sails of the gay pleasure craft to a point that gives pace without risk of seasickness. It is possible that the artist may have slightly exaggerated, that the cliffs may have been made somewhat too grandiose and imposing, and that the sands may be less satisfactory than they seem as represented. It is certain that our English skies are not always sunny, nor are the seas invariably serene, even in July. But the holiday-maker makes allowances as he gazes on the placards; and, in any case, he is sure not to be greatly disappointed, especially in so fine a season as the present.

Considering the ample variety of choice, it is difficult to understand the popularity of some places for which nature has done comparatively little. We presume it is due partly to proximity of the trippers to the lines which lead to these, and very much to the fact that working folks, with many middle-class Britons as well, think more of sands than of scenery. As they either work hard when at home, or have not the habit of exercise, they do not care to go climbing hills or scrambling along a broken beach. The midday meal is the great feature in the day's entertainments; and in that, though we should differ as to the dinner-hour, we are strongly disposed to sympathize with them. Now when a party is burdened with capacious baskets, to say nothing of being encumbered by children of assorted sizes, down to the lakes in arms or going about by pairs in perambulators, ambitious locomotion is out of the question. So tickets are taken for one of the Essex watering-places, or one of those others on the Kentish coast between the Thames and the North Foreland. And the surroundings are of comparatively little consequence, the sea and the sea air being everything. We fancy that people who have been accustomed to move about pretty much as the spirit moved them, at all events since they came to years of discretion, can scarcely realize the sensations of a change so complete to those who have been born and brought up in the City alleys. Each familiar object that appears commonplace to us is to them a marvel or a new revelation. If they have souls for the natural beauties of the creation, although their perceptions must necessarily have been imperfectly developed, and their admiration may be more instinctive than intelligent, it is enough to gaze their fill on the expanse of the ocean, with the ships and steamers going up and down upon it; or to turn on their backs with their heads on their hands, and for once to look up through an atmosphere undefiled, at heavens unclouded by the odoriferous smoke that hangs over the innumerable chimneys of a city. In the immediate foreground there are objects of interest of all kinds, from the gaily dressed people making holiday like themselves to the sea-creatures and the beautiful seaweeds in the pools that have been left by the tide. We are inclined to pity them because their pleasures must be so brief; because the isolated holiday must be drawing to an end before it seems to have well begun. However invigorating the air, they can hardly have breathed enough of it to do them any permanent good. And yet we are not by any means sure that our pity may not be misplaced. At least, they have had no time to experience any sense of boredom; and if the actual tonic of the ozone has been transitory in its effects, they have, nevertheless, carried away recollections which may cheer and inspirit them for weeks to come. There will be roughs in any crowd, of course, who run upon the public-houses, and excite themselves with excessive indulgence in strong drink to fonder and more blasphemous talk than usual. But, as a rule, the mixed multitudes of excursionists are very well behaved. It is a sad heart that never rejoices; and it should be a pleasure to think that, with the monotonous lives they lead, they have nevertheless managed to keep good spirits at call.

We confess we are not inclined to be so tolerant to a class of sea-trippers who are better to do in the world; who take first-class railway tickets and patronize expensive lodgings or hotels, and who seeming, in fact, to go in the first place for the sake of spending money, have succeeded in raising the prices of everything. Cockneys of the Cockneys, ostentatious and pretentious, they are loud in their voices, and even louder in their dress. Ready as they are to ape "the aristocracy," it has always surprised us that they do not lay themselves out to take some profitable hints from the habits of the gentry. We suppose it is impossible for any one to the manner born to get rid of the practice of dropping the *A*. But we should have fancied that it must have been made obvious by observation to our Cockney friends that gentlemen, when in the country or by the sad sea waves, do not, as a rule, wear purple and fine linen; that they discard frock-coats for the easier shooting-coats, and exchange broadcloths for simple

tweeds; that matrons out for a drive along the cliffs, when the thermometer is marking 90° in the shade, do not button themselves up in many-piled velvets; and that maidens, even in these days of fashionable monstrosities, do still, under certain circumstances, affect some simplicity in their dress. It is the worst of some watering-places—Hastings, for example—that there is show scenery in the neighbourhood, either pretty or even romantic in itself, which is utterly spoiled by the company which throngs to it. We like to meet the working-man, with his coat off, near "the Lovers' Seat," either giving his arm to his "missus," or passing it round the waist of his "young woman," as he drags one or the other up a stiff bit of ascent. But we should gladly dispense with the curled and scented groups, displaying the airs and graces of Olapham or Islington, whose overpowering odours of exploded scents come so offensively between the wind and our nostrils. Tobacco must always be tolerated or tolerable, though the most inveterate smoker may scruple to light a cigar on a sea cliff; but we detest having the fresh breezes off the Channel tainted by millefleurs or frangipani. Considering the splendid costumes in which these brilliant visitors are attired, it is but natural that they should take the least possible amount of exercise. Besides, they are so sadly out of condition that the slightest exertion takes the stiffening out of collars or frills; while they seem to fear that the breeze which is fanning their fevered cheeks may indiscreetly ruffle their ambrosial curls. They have crawled up to the heights by the circuitous driving road, cruelly overweighting the unhappy fly-horses; and after their adventurous expedition to those storm-beaten heights and savage gorges, they go home to recruit exhausted nature. Against a good dinner by the seaside or anywhere else, as we observed before, we have nothing to say. But as we sit at our little table in the hotel, over the modest repast that has been earned by hard work, we cannot help feeling censorious towards our neighbours who are stuffing on the strength of having done nothing at all. They apparently ignore altogether the heavy lunch which came so quickly on the heels of a most sufficient breakfast; and should they stave off apoplexies for a time, they can hardly escape instant retribution in the shape of nightmares. Those are the good people who inoculate coffee-room waiters with the notion that hotel guests must be always in a chronic state of famine; while, by the gusto with which they swallow any kind of sparkling wine so long as the charges vouch for the quality, they make hotel-keepers and managers careless of their cellars. It is possible that, in spite of appearances, their sojourn by the sea may have been a pleasure to them; but it is certain that it can hardly be of benefit to anybody but their chemists and physicians.

You cannot choose your company in marine hotels; but it is easy enough in some cases to get away from it if you do not like it. All places are not like Hastings, with a chief show-place which everybody makes a point of visiting. And, indeed, a regular show-expedition may be sometimes rather useful than otherwise, diverting the popular rush as a lightning-conductor attracts electricity. Thus Brighton is tolerably full of visitors in a season which lasts all the year, and the drive to the Devil's Dyke is greatly in favour. Of a fine afternoon that grand point of view is mobbed like a country fair; while you may walk any day across the breezy downs to Lowes, or follow the line of the commanding cliffs to Newhaven, without stumbling upon a soul in the whole course of your rambles. And it is still easier to find seclusion, starting from Eastbourne, in some of the most pleasing scenes of their kind in Southern England. Climbing the range of the downs behind Beachy Head, you have left "society" and excursionists far beneath you, while the strains of the bands on the promenades are still borne faintly to your ears. And in two or three miles more you are dropping down among out-of-the-way villages, with primitive aspects that carry you back to the days when Brighthelmston was nothing but an insignificant fishing town, and when "old" Eastbourne clustered inland round the parish church. So the London excursionist may please himself, and either enjoy the humours of the place or indulge in solitary communings with nature.

#### THE SCOTCH BANKS.

THE announcement that at a meeting of the directors of the seven unlimited Scotch banks it has been decided to adopt the limited liability of shareholders assures the complete success of Sir S. Northcote's Act. That Act has been law for two years, and until now not a single Scotch bank has shown a disposition to register under it. It has appeared uncertain, therefore, whether the Act would meet all the circumstances for which it is intended to provide. To thoughtful persons, of course, there never was a doubt, since the London and Westminster, the London and County, and the National Provincial banks decided to register under the Act, that all the other banks of the country must in the long run do the same; but it must be admitted that the delay has been very considerable, and the persistence of the Scotch banks in refusing to take advantage of its provisions has been specially disappointing. It was the failure of a Scotch bank which gave occasion for the passing of the Act. The widespread ruin caused by that failure to innocent families, and the distress that followed, induced Parliament to pass a measure enabling all banks to become limited, and yet the Scotch banks have refused hitherto to avail

themselves of the permission. For a long time, too, they were positive in asserting that they would not register, and that Parliament must make an alteration in the law before they could become limited. But the change of Government and the firmness of the new Ministry in adhering to the decision of their predecessors have brought home to the Scotch banks the necessity of yielding to the inevitable. The grounds on which the Scotch banks based their opposition are plausible, though we do not think them sound, and the banks now admit that they do not themselves believe in their soundness. They are, that the principle of limited liability is unknown in Scotch banking; that the competition between the banks is so intense that no bank or group of banks can afford to do anything which would make the security it or they offer appear less than that of their competitors; that the three old Scotch banks—the Bank of Scotland, the Royal Bank of Scotland, and the British Linen Company—though limited by their charters, are not required to write the word “limited” after their names, and, in fact, are not generally believed to be limited; that Sir S. Northcote’s Act requires of the banks registering under it to take the word “limited,” and that, therefore, the present unlimited banks by registering would label themselves in a manner which would proclaim to all the world that the security they offer is less than it formerly had been, and consequently it would seem that the old banks, which are not obliged to call themselves limited, would have an advantage over them.

The good sense of the Scotch people, and the terrible experience they have had of unlimited liability where a bank fails, have compelled the directors to change their tone and agree to register under the Act. In the case of the Glasgow Bank it was seen that a shareholder holding but a single share might risk the whole of his property; that a wealthy family, for the sake of a small income, not materially adding to their income from other sources, might bring themselves to absolute bankruptcy; indeed, among the shareholders of the Glasgow Bank the number who were able to pay all the calls made upon them was very small. The rest have been obliged to surrender their whole fortunes, and compound with the liquidators; and, what is most grievous, those who have thus been absolutely ruined are deburred from partaking in the assets of the bank when realized, which now promise to be very considerable. Worse still, a trustee deriving no personal benefit of any kind from his trust, on the contrary, incurring great responsibility, labour, and anxiety, risked his whole fortune by merely consenting to act as trustee to persons who owned bank shares. After this experience it was quite clear that trustees would never again continue to hold the shares of unlimited banks. They would either refuse altogether to act as trustees, or they would insist upon selling the shares within a year after the death of the person under whose will they acted. But a property which thus cannot be placed in trust practically becomes a property unfit for investment. If a man intending to provide for his wife, his daughters, and his young children, cannot leave shares in trust—must either agree that they are to be sold on his death, no matter how depressed the market may be, or must sell them during his lifetime—those shares necessarily cease to be fit for investment. A man may speculate in them, intending to sell out during his own lifetime. But practically as a permanent investment he cannot put his money in them. The shares of unlimited banks thus would cease to be fit property for investment. They would thereby become depreciated in value, and the whole class of bank proprietors would deteriorate. The shares would pass into the hands either of reckless people, or of poor people who risked little or nothing but the shares themselves in case of a failure. Moreover, all stockbrokers would, as a matter of course, advise their clients against investing in the shares. They would point out the risk involved, and would show that much safer investments which yield nearly as good an income could be found, and ought to be preferred. As we have said, the first result would be a great depreciation in bank shares, and this depreciation would inform all the world of the deterioration in the banking proprietary. Thus the real security offered by unlimited banks would become much less than of limited banks, and the management would tend to be more reckless. The poorer and more imprudent the proprietary became, the more anxious they would be for large dividends. They would therefore constantly clamour for a mode of business which would be more profitable, which is only another way of saying would be more risky. All this could not fail to impress itself upon a thoughtful and prudent people like the Scotch, and it is quite clear that the representations of the shareholders have at length become so strong that the Directors have not been able to resist any longer.

The unlimited Scotch banks have not yet stated the terms on which they will register under the Act. But of course they will follow the precedent set here in England. As the Act requires, a portion of the capital will be paid up; another portion can be called up in case the business should require a larger capital or in case a part of the capital should be lost; a third portion will be held in reserve, to be called up only in the event of the winding-up of the Company. The whole question as to whether the new arrangement or the old will be the safer depends upon the amount of the reserve capital provided. It is clearly right that the reserve should be large enough to cover all probable demands in case of the winding-up of the concern—a mere nominal reserve will not do. Besides it should be borne in mind, that the whole of the reserve will probably not be paid if called

up. People will invest in the new shares just as they invested in the unlimited shares, without fully calculating whether they are able to pay the whole amount that may be demanded from them if called upon. It would be necessary, therefore, to allow for a certain proportion of default in case the banks should be wound up. The problem before the Directors of unlimited banks in becoming limited, therefore, is how large a proportion of reserve they should provide, making allowance both for the probable amount to be provided if their bank should fail, and also for the probable inability of some of their shareholders to pay up the whole of the calls upon them. If this problem is solved satisfactorily, it is quite evident that the banks under the new system will be quite as safe and will offer quite as good security as the unlimited banks do; while neither trustees nor prudent capitalists will be deterred from investing in the new shares. A prudent investor will be able to calculate for himself how much he risks in the most unfavourable event, and, of course, he will not buy the shares of any bank of whose solvency and good management he is not satisfied. He will also be able, if he is an intelligent and active man, to exercise a certain amount of influence over the management. But the great point will be that a man in buying a new share will know the full amount of the risk he runs, whereas in buying an unlimited share he risks, for the chance of a very small profit, his whole fortune and more.

The decision of the unlimited banks to register under the Act of 1879 again brings up the question, What is to become of the three chartered banks? It will be recollected that at the beginning of this Session the three older banks applied to Parliament for powers to enlarge their capital without taking the word “limited” after their names. They pleaded that, being already limited, they could not register under Sir S. Northcote’s Act, and they added that their charters relieve them from the necessity of taking the word “limited.” In fact, their argument was that they desired to give greater security to their customers than they are now obliged to give, and that, in making their application to Parliament, they were seeking no favour for themselves, but were anxious to give greater security to the public. The Government, however, decided not to grant the legislation demanded, and doubtless this decision has gone a great way in inducing the unlimited banks to register under Sir S. Northcote’s Act. They will in future be able to give a greater security to their customers and to their noteholders than the older banks. To their ordinary creditors they will give the security, not only of all their working capital and investments of every kind, but of the reserve capital, which cannot be touched upon until winding-up; and, as far as the notes are concerned, they will still continue unlimited. But the three chartered banks have no reserve capital worth speaking of, and are limited in regard to their notes as well as to the rest of their debts. They are thus placed in a very awkward position. No doubt they are still at liberty not to add the obnoxious word “limited” to their names; but it is now advertised all over Scotland that they are, in fact, limited, and that they have no reserve. From Mr. Gladstone’s answer in the House of Commons this week it would seem that he really intends to legislate upon the note issue at an early date. His answer was cautious, of course, being in effect that a Minister cannot be expected to say what legislation he will propose until he is ready actually to propose that legislation. But, at the same time, he indicated pretty plainly that, if health is spared him and the Government lasts, he will deal with the note issue. It would seem probable, therefore, that he has no intention until he is able to change the law upon this point to pass an enabling Act as regards these older Scotch banks, and that they will have to continue in their present condition.

#### THE MEININGEN COMPANY AT DRURY LANE.

WITH *Wallenstein’s Lager* and *Der Eingebildete Kranke*, played for the first time on Tuesday night, the Meiningen company may be said to have brought their London season to an end. The few remaining nights of their stay have been devoted to repetitions of pieces already given, and particularly to *Julius Cæsar*, the most successful, though not, we think, the best, of their performances. Of the two, the *Lager*—a piece mostly spectacle—was far better adapted to the resources of the company than the French comedy. The *Wallenstein* trilogy, as a whole, is rather a dramatic poem, as Schiller himself called it, than a series of plays, and the first of its three parts is manifestly rather directed to the reader than the spectator. It is an attempt, and in the main a successful one, to realize the scene of the *Piccolomini* and of *Wallenstein’s Tod*. It aims less at giving a continuous action, than at describing and making lifelike the chorus of the following plays, that artificial military people which the Friedländer brought into existence almost literally by stamping his foot. There is no plot—only a definition of the body about to be acted on by some forces as yet unknown. One after another the military types—the soldier of fortune, the soldier for the love of adventure, and the soldier for the sake of religion, the children of the camp and their mothers, the disreputable persons Rittmeister Dugald Dalgetty was going to describe to his Highland hostess—are brought forward and made to “pose”; and, when each has had his or her say, the piece ends. If plot is indeed indispensable, then such a piece might be called unfit for the stage. But a piece may have other attractions besides plot. There are deductions enough to be made from the applause given

before we can judge how much of it was due to Schiller. The mere brilliancy of the tableau goes for much. The audience were mainly Germans, and in these days any picture from the times before their armies had temporarily ceased to be the best in Europe is tolerably safe of their applause. Most of the Englishmen in the house may be credited with the acquaintance of the immortal Dalgaty, or even of Defoe's "Cavalier," and would naturally enjoy seeing them in their habit as they lived. But withal it was Schiller who made the spectacle possible, and we believe that a theatre-goer, and we dare say there were many such even in the stalls, who knew not whether Wallenstein was Catholic or Protestant, might bring away from the *Lager* a very vivid idea of the life that had been "posed" before him. If it has not a unity of story, it has unity of portraiture, and though there is nothing in the piece absolutely false to the time, Schiller has so skilfully drawn only the passions that are universal, that his characters are as intelligible now as they would have been in the camp before Pilsen. Its truth to life justifies and explains its theatrical effect.

We have already said enough to show that we consider the *Lager* to have been admirably put on the stage. None of the many spectacular effects given by the Meiningen company have been finer than this picture of the swarming camp with its superficial disorder and its real discipline. If a fault is to be found, it is in the too modern air given to Wallenstein's men. Not that the dresses were inaccurate, though we noticed that Holk's mounted Jägers had been deprived of the green dress Schiller was careful to give them. But we do not doubt that the uniforms and armour were carefully copied from contemporary drawings. The modern air was due to the fact that they were too new, too good. We imagine that the Imperial soldiers were rather what Defoe's "Cavalier" describes them, a mixture of rags and finery. Their clothes were ragged, though their arms were always bright, to use a phrase which an American military writer has borrowed from Defoe and applied to the army of Northern Virginia. Neither do we think it right that Tiefenbach's arquebusiers should be made to look like comic Puritans. But these are small defects in an admirable general artistic effect. Perhaps the finest tableau of the whole was the struggle of the Croats to keep the angry soldiers off the Capuchin. Among the supers in this scene was a cuirassier who helped the Croats and whose byplay was admirable. Indeed the byplay was excellent throughout, sometimes so good as to draw off attention from the speakers. This was particularly the case with Frl. Habelmann's acting of the sutler. Herr Nesper looked very imposing as the Pappenheimer, though he was a little too lachrymose when he describes the soldier's stormy life. Herr Teller's Capuchin delivered his burlesque sermon with admirable comic effect, but he might with advantage have been less conscious of his own fun.

Of the *Eingebildete Kranke* we must speak less favourably. There is, no doubt, a strong element of farce in the *Malade Imaginaire*, but it should be delicate, not, as rendered by the Germans, broad and exuberant. We do not mean that the acting, even taken as a whole, was without its good points. There were grace and good manners in Herr Heine's playing of M. de Bonnefoi's polished roguery. Yet, even in his case, his position as Belline's lover, only hinted at by Molière, was too broadly indicated. The two actors on whom the piece mainly depends—Herr Hassel as Argan and Frl. v. Moser-Sperner as Toinette—played with liveliness and force, Herr Hassel often with excellent senile fatuity, but both too noisily.

This, our farewell to the Saxe-Meiningen company, seems to invite a general review of their stay among us. In our successive notices of their performances, we have endeavoured to point out what was good or less good in the individual acting; but, until we could look back on their season as a whole, it has not been possible to judge how far they have justified their reputation. Their strength was believed to be in their stage management, and in their avoidance of the so-called "star-system." This would include every possible theatrical excellence if we were to accept it literally. A company "exceeding eighty persons," in which all were equally capable of playing important parts well, would be something almost above criticism. For, be it observed, the admirers of the company claimed as much for it, and used the phrase "star system" as if it meant the having in the company of one or two actors who were markedly superior in ability to their comrades, whether the inferior members were or were not good in their degree. The Meiningers were, according to some, a ship's company, all captains. Of these two claims, the first alone has been justified to the fullest extent. The drilling of the crowds, the byplay of the "chorus," the care taken in details of dress, furniture, and scenery, the artistic arrangement of the "picture," have all been worthy of the praise they have received. The Saxe-Meiningen company have shown us a series of splendid pictures realizing famous scenes in literature or history which we shall always remember with pleasure and artistic profit. But this part of scenic representation is liable to abuse. The true dramatic action of a play may be sacrificed to the setting, the human interest to the machine. And this, as we have before pointed out, has more than once been the case at Drury Lane. A very great actor dominates these things, but a merely good one is liable to be overpowered by them.

This immediately brings us to the question of the individual qualities of the actors. In its full extent the claim made for the company was incredible. To again employ our nautical simile, no ship is wholly manned by captains, nor is it desirable that it

should be. There is a very familiar proverb about the folly of using razors to cut blocks, and it is equally true that a great actor in a very small part is a waste of material. The number of great men in any profession is not so large that we can afford to treat them lightly, and their proper place is in command, not in the ranks. If Herr Barnay was on the stage among the "supers" on Tuesday night, we can only say we are very sorry for it. We should greatly have preferred to see him "as Der Kürassier von einem Wallonischen Regiment." But, as might have been expected, there is neither an equality of talent among "Die Meininger" nor an equality in the distribution of the parts. It is true that in some cases actors who have played important parts one night take on the following a character in which they have to appear comparatively seldom. But the importance of a part depends much less on the number of times an actor has to come on the stage than on the call made on his powers when he is there. We see far less of Mark Antony than of either Brutus or Cassius in *Julius Caesar*, but the great part of the play is Antony's. In *The Robbers*, again, the part of Roller is a small one, if we judge by the mere number of words he speaks, but in one scene he must play well, and we saw that the part was (very properly) given to Herr Teller. Those of the company who have a marked individuality of character, Herren Teller and Hassel, or Frl. v. Moser-Sperner, have only been cast for parts they were fitted to play. Frl. Haverland has appeared very seldom, and then in important parts. The company possesses a more than fair proportion of good actors, and, as a whole, is admirably drilled; but it shows the faults as well as the virtues of good drilling. The aim of drill is to make all as like as possible; and, according, we find that several of the Meiningers are monotonous in their elocution and mechanical in their gestures. The one really great actor among them towers as distinctly over them all as if no opposition to the star system had ever been heard of. Looking back on the series of the performances, we remember many brilliant spectacles, an almost perfect rendering of *Twelfth Night*, much good acting, some of it by players who have not uniformly pleased us, but only one thing that was great. And that was the acting of Herr Barnay.

## REVIEWS.

### POETRY OF BYRON.\*

IN his thoughtful and suggestive preface to this selection, Mr. Matthew Arnold expresses the opinion that Byron, like Wordsworth, will gain by the process of "disengaging his good work from the inferior work joined with it." He would probably not contend that such a distinction is equally definite or practicable in the case of the more popular poet. Wordsworth wrote some things which approach perfection, and many things which are more or less dull, tedious, and prosaic. Mr. Arnold, with excellent taste and judgment, collected nearly all the poems of high value, and published them apart from the heavy mass of didactic and descriptive commonplace. Students of Wordsworth had long before performed for their own benefit a similar operation when they instinctively passed over three-fourths of the poems, to recur with untiring pleasure to the spontaneous outbursts of the poet's youthful genius. Mr. Arnold has done much to justify and revive the enthusiasm of early admirers, and to bring Wordsworth to the knowledge of a younger generation. A similar presentation of Byron's more successful efforts was a harder task. Mr. Arnold quotes with approval a saying of Mr. Swinburne's that Byron rarely wrote anything either worthless or faultless; but he dissents from the not unnatural inference that "the greatest of his works was the whole work taken together." There can be no doubt that, as Mr. Arnold says, "there are portions far higher in worth and far more free from fault than others"; but it would not be impossible to select another volume of passages from Byron as good as the present selection. Such an attempt in the case of Wordsworth would result in ludicrous failure. Every passage in the later cantos of *Childe Harold* is like every other; and almost the only advantage of selection is that fragmentary reading disguises the impression that Byron deliberately versified his reminiscences of travel, much as Scott, according to the publisher in Moore's *Two-penny Post-bag*, started from the North for London, and, beginning with Rokeby, "meant to do all the gentlemen's seats by the way." Mr. Arnold's extracts from the tales in verse will perhaps surprise and disappoint readers who had not hitherto reconsidered or revised their youthful admiration of Byron. The combats of Hassan with the Giaour, and of Selim with the followers of Giafar, though fluent and spirited, are far inferior to the battles and single combats of Scott. The familiar opening of the *Corair*, with the lines—

O'er the glad waters of the dark blue sea,  
Our thoughts as boundless, and our souls as free—

and the passage which follows, is on a level with the prize poems of Milman, Praed, or Macaulay. The best excuse for the affected archaisms at the beginning of *Childe Harold* is that the poem was then in a tentative stage, from which it soon emerged to a higher

\* *Poetry of Byron*. Chosen and arranged by Matthew Arnold. London: Macmillan & Co. 1881.

level. It was perhaps scarcely worth while to repeat the statement—

That now Childe Harold was sore sick at heart,  
And from his fellow bacchanals would flee.  
'Tis said, at times the sullen tear would start,  
But pride congealed the drop within his ee.

Some of the extracts from *Don Juan* are little better than doggerel; and, indeed, the finer parts of the poem are constantly marred by the flippancy and ostentatious carelessness of neighbouring passages. The satiric genius of Byron is not exhibited in the trifling rhymes addressed to Murray, for which Byron's savage attack on George IV. under the name of Vitellius might have been advantageously substituted. It might perhaps have been desirable to insert the whole of the powerful and humorous *Vision of Judgment*. The "Isles of Greece," the graceful "Farewell to Thomas Moore," the "Maid of Athens," the "Ode to Napoleon Bonaparte," and other selected poems convey a juster impression of Byron's lyrical faculty. The dramatic section consists, as might be expected, of extracts from poems written in the form of dialogues. There is, properly speaking, nothing dramatic in *Mansfield* or *Cain*, and the Venetian dramas and *Sardanapalus* are artificial and tiresome. *Mansfield* is, to use a phrase not invented in Byron's time, a monogram of a moody misanthrope, decorated for stage effect with supernatural trappings. The last and best line—"Old man, 'tis not so difficult to die"—contradicts all the previous tenour of the poem. With the aid of a dozen capricious and monotonous Spirits, the hero constantly meditates or attempts suicide in vain, being reserved to die a natural death when his store of querulous blank verse is exhausted.

Mr. Arnold would probably admit that in all Byron's works there is not one perfect line; but he agrees with Mr. Swinburne in ascribing to the poet the high qualities of "sincerity and strength." Both attributes may be allowed to exist, although it would, perhaps, be necessary to frame a special definition of sincerity for the purpose. The constant affectation of melancholy and mystery must be remembered in conjunction with the genuine feelings which may entitle Byron to the praise of sincerity. As to his strength there is no room for controversy, though it was, perhaps, more conspicuously exhibited in his letters and in his life than in the poetry to which he owes his world-wide fame. Few men in any generation have been his superiors in wit, in vigour, and in general brilliancy. Some of his most popular works might have been written by the cleverest of men almost without the aid of poetical genius. There is probable no other instance of a poet who was so incapable of sound poetical criticism. His extravagant praises of Pope may, perhaps, be partly explained by his love of paradox, and by his wish to mortify contemporary rivals. With Shakespeare and Milton he had little sympathy; and it is difficult to believe that he could have cared for Dante. His high-flown eulogy on Goethe was not founded on any knowledge of the poet's works, for Byron was ignorant of German. It was to his credit that personal friendship enabled him to appreciate the wonderful genius of Shelley. It may be doubted whether Mr. Arnold is correct in his statement that Shelley "sincerely felt, and was right in feeling, that Byron was a greater poetical power than himself." He glorified his friend in lofty verse as

The Pilgrim of Eternity, whose fame,  
Over his living head, like Heaven, is bent;

and he felt for him the exaggerated respect which conscious dreamers pay to accomplished men of the world; but in one of his letters Shelley remarks that his relations with Byron would be easier if he were not himself aware of his claim to intellectual equality. Shelley could not be ignorant that all their common friends esteemed him a poet of a higher order than Byron. Nevertheless, Mr. Arnold is right when he observes that "those who extol Shelley as the poet of clouds, the poet of sonnets, are only saying that he did not, in fact, lay hold upon the poet's right subject-matter." In felicity of musical diction Shelley is far superior to Byron. His most distinctive excellence is, as in the case of Wordsworth, unintelligible to foreigners who are necessarily unacquainted with the nicer peculiarities of the English language. The rapid flow of Byron's verse, with its easily understood passion and invective, has made him almost the sole representative on the Continent of the English poetry of the present century. He has the great merit of being never obscure; and he reflected, to the delight of England and of Europe, the newest version of a theory of discontent. Mr. Arnold perhaps takes Byron's language too seriously when he praises him for "waging against the Conservatism of the old impossible world so fiery battle." By accident he found himself on the Liberal side; and he expressed the opinions of the party with confident iteration. It was not "the cynical make-believe of his own aristocratic class which drove him to fury." Personal dissatisfaction had much more to do with his opinions and his declamations than any kind of doctrine. The theoretical opinions of a poet are of secondary importance, even where they place no impediment on the expression of his genius. Shelley ceased for the time to be a poet when he occupied himself with fantastic projects of reforming the world. Byron turned his rough political sympathies to better literary account. Perhaps the best proof of his title to enduring fame is the fact that his popularity has survived two generations. More than fifty years have passed since Mr. Mill fancied that he had ceased to be on friendly terms with Mr. Roebuck, because one of them preferred Byron and the other Wordsworth. It may be hoped that not even bookworms or metaphysicians are capable of similar per-

versity now; but the two parties still exist, and the weight of one may balance the numbers of the other. Mr. Arnold sympathizes with both, though, even as an editor of Byron, he retains his opinion of the superiority of Wordsworth. In the frequent intervals which separate in either case the happiest efforts of the poet, Byron often proves himself a brilliant rhetorician, while Wordsworth is prosy and dull; but epigrams have as little to do with poetry as platitudes. The true test of poetical art was symbolized by *Æschylus* and *Euripides* in Hades, when they alternately placed their most sonorous lines in the scales of *Dionysus*. One perfect verse outweighs whole volumes of spirited declamation. Mr. Arnold regards as a chief merit of Byron the wrath which prompted his denunciation of established creeds and institutions; but fierce indignation produces the verses of *Juvenal* and not of *Lucretius* or *Virgil*.

Not the least interesting part of Mr. Arnold's too short preface consists of his discussion of earlier criticisms, and especially of some well-known remarks of Goethe, who said that Byron was "unquestionably the greatest talent of the century." Mr. Arnold thinks that "talent" was intentionally distinguished from genius; but probably the colloquial barbarism was used without any definite purpose. "The English may think of Byron what they please; but it is certain that they can point to no poet who is to be compared to him. He is different from the rest, and in the main greater." Mr. Arnold shows much ingenuity in explaining away superlative praises which really show only that Goethe, like humbler men, was capable of hyperbolic language. On the same or another occasion Goethe said that Byron, "as soon as he begins to reflect, is a child." The various propositions are wholly irreconcilable, but the exaggerations on either side may be set off against one another. Goethe, with all his accomplishments, was not a master of the niceties of English style, nor was he otherwise infallible. Like an early commentator on Aristotle or on the Scriptures, Mr. Arnold deduces from his text the conclusions which have approved themselves, in the first instance independently, to his own judgment. It would be indecorous or profane to hint that his master was wrong, instead of undertaking with subtle refinements to explaining his meaning away. The justest and most sincere estimate of Byron which Goethe at any time pronounced is to be found in the fanciful character of *Euphron* in the Second Part of *Faust*. It is one of the most wonderful of Goethe's intellectual exploits to have conferred poetic substance and beauty on an allegory which in less masterly hands would have been tedious and frigid. Helen, fearing the resentment of Menelaus, is advised by *Mephistopheles*, in the disguise of *Phoreyas*, to take refuge in a castle which, during the absence of the Spartan king, has been occupied by a strange band of heroes from the North, whose king and leader is no other than *Faust*. The newcomers are the German and Scandinavian conquerors of a distant age, under eponymic chiefs or dukes, German, Norman, Saxon, and Frank. More fully to represent the spirit of mediæval chivalry, *Faust* woos Helen in magniloquent and almost euphuistic phrase; and the pair, representing the union of classic and modern imagination, retire alone into the halls of *Faust's* Gothic stronghold. Soon afterwards *Phoreyas* informs the chorus of captive Trojan maidens, who are also elemental spirits, of the birth of a wondrous child of *Faust* and Helen, who, like *Hermes* in the Homeric hymn, is active and daring from his birth. *Euphron*, who is in general modern art or poetry, and more specifically Byron, is supernaturally agile, but unable to fly. To the alarm of his parents, he rises by leaps and bounds to the top of otherwise inaccessible rocks, where in a cleft he finds a mantle and a harp, with which he assumes the semblance of *Apollo*. After a dialogue conducted in the graceful lyrics of which Goethe alone had the secret, *Euphron*, as he climbs higher, knows from the son around him that he is on the *Poloponnesus*, perhaps at *Missolonghi*, and his song passes into a warlike strain appropriate to the Greek enterprise of his famous prototype. He imagines that wings are sprouting from his shoulders, and he commits himself to the air. His garments bear him up for a while, and a flash of light follows his course; but, in the words of the stage direction, "A beautiful youth falls at the feet of his parents, and it is thought that in the dead a well-known form is recognized; but the bodily part at once disappears, the glory (*auréole*) shoots up to heaven like a comet, the dress, mantle, and lyre remain on the ground." The chorus laments him in a dirge which obviously relates to Byron:—

Born to all that earth could give thee,  
High forefathers, mighty power,  
Lost to thee, alas! too early  
Snatched away thy youth's fresh flower;  
Piercing glance the world to measure,  
Pity for all hearts that moan,  
Glowing love of noblest women,  
And a music all thine own.

The chorus then laments that he threw himself by his own choice into the inextricable net of destiny, and that he broke violently with custom and with law; but at last his lofty spirit gave the victory to a pure resolve, and he sought a noble object, but he could not succeed. As if to remind the careless reader that *Euphron* personifies modern poetry in its most popular writer, *Phoreyas* or *Mephistopheles* takes up the robe, the mantle, and the lyre for the behoof of Byron's successors and imitators. As Sir Theodore Martin has faithfully rendered the speech:—

Rare treasure prove is there to view;  
The flame has disappeared, 'tis true.

Yet is the world no whit the worse.  
Here is enough to consecrate  
A legion of the sons of verse.  
To scatter envy, malice, hate,  
Amongst the poetaster crew;  
And if to give them genius too  
Surpass my power, at least confess  
I can supply them with the dress.

From the whole episode it may be inferred that, in Goethe's judgment, the Muse of Byron was only half divine. The relics of Euphorion serve only for vulgar uses. On the other hand, the dress of Helen, or the study of classic art, who also vanishes after the loss of her child, bears Faust far away from the earth:—

Hold fast, I say—  
'Tis not indeed the goddess thou hast lost,  
Yet is the thing divine. Turn to account  
Its priceless virtue, and ascend in art;  
High o'er all common things 'twill bear thee on,  
Wafted on ether, long as thou canst fly.

The same judgment is indicated by the frequent reference to Byron's character and history as distinguished from his poetic genius. In Helen, the representative of Greek antiquity, there is nothing personal. Although an examination of the opinions of so considerable a critic as Goethe is interesting, and possibly instructive, the result, if it were certainly ascertained, is not decisive of the controversy on the merits of Byron. The natural and legitimate judges of the worth of the poet are those who speak his mother-tongue.

#### THE HIGHLANDS OF SCOTLAND.

GUIDE-BOOKS are regarded with very different feelings by the tourists who use them, by the hotel-keepers and shop-keepers of the countries they describe, and, lastly, by the natives of those countries who keep neither shops nor inns, and are annoyed, not benefitted, by invasion. The tourist, the modern nomad, regards his red-covered guide-book as one of his dearest treasures. He carries it about in his pocket, and consults it before he ventures to climb a hill or admire a picture. He wears it like the badge of all his race, with an air of pride which is almost unaccountable. The air of the tourist is that of a warrior in a conquered country. He generally seems, moreover, to think himself a meritorious explorer of districts hitherto scarcely known to any but the compiler of his monitor. The hotel-keeper and the shop-keeper welcome the appearance of guide-books, strapped up with rugs and plaids, as the poet welcomes the first swallow, or, if he be an æsthetic poet, the daffodils that came before the swallow dares. Guide-books are a sign of the sweet season when Cockneys must pay exorbitant prices for the privilege of passing sleepless nights in crowded coffee-rooms. But the less mercenary children of any country, especially of a beautiful and mountainous country like Scotland or the Lake district, look on guide-books as the mark of the Beast. These volumes attract ever-increasing bands of vagrom men and dowdy irrepressible women into regions of which quiet and solitude were the charms. Wordsworth used to feel this very much. We do not know that he ever wrote a sonnet against guide-books; but, if he did not, it was because he had expended his energy in attacks on railways. The natives of the Westmoreland and Cumberland hills and lakesides have a natural and undying antipathy to tourists. It is not pleasant if your fathers have left you a home by the silent shores of Windermere or on some fairy island of a lake to hear 'Arry howling his lyrical lamentations for "The Good Young Man who Died" under your windows, or enchanting the ear of night with a performance on the French horn. Boatfuls of 'Arries make the still moonlit nights hideous on the English lakes, and coaches laden with this variety of our species will soon be toiling over every road in the Highlands. Every little fishing-inn will be full of men in preposterous tweeds, who will flog the amber pools with every absurd fly and patent artificial minnow that can be found in the shops of the Strand. Only along the beautiful north-western coast there are few inns, and nature and the divine race of lairds have everything their own way. This is an arrangement disliked by Mr. Baddeley, the author of a clever, though flippant, Guide-book to the Highlands of Scotland which has just been published.

We cannot sympathize with Mr. Baddeley's purpose. We regard the Highlands as Clough did the beautiful pool—

I name not its name, lest inquisitive tourists  
Hunt it, and make it a lion, and get it at last into guide-books.

Human nature is selfish enough to wish that tourists would be content to leave the Highlands unvisited. Mark Twain has regretted that Christopher Columbus ever discovered the New World, and it seems almost a pity that Walter Scott discovered Scotland. The peace and quiet of the hills is gone, and, what is still more provoking, all the waters are over-fished. But regrets are vain. In spite of the landlords of Scotch inns (who really have done their best to frighten visitors away), people will come, and climb, and fish, and sketch, and light fires, and leave buttery pieces of newspaper and empty eggshells by the side of every burn and in every green place and on every high hill. We must, we presume, take things as we find them, and admit that, if a new Guide-book to the Highlands was a necessity, Mr. Baddeley has done his work

efficiently well. It is not so minutely informed or elaborate as that best of all these works, *The Sportsman's Guide to Scotland*, which is the modern Caledonian *Polybion*. Mr. Baddeley leaves the fishing alone, and addresses people whose mild ambition is satisfied by Scotch climbing, or whose enviable simplicity leads them to suppose that "one of the chief objects of touring is a temporary relief from all care and worry."

There is some interest in Mr. Baddeley's general remarks on the subject of travelling in Scotland. Why is it so expensive? Not because the railways make heavy charges, and not, says our author, because the prices on board the steamers are exorbitant. For our own part we think one shilling and threepence for a glass of brandy and soda-water an almost prohibitive tariff. But Mr. Baddeley is satisfied with the Clyde and Western steamers. He finds what he calls the "bêe noire of Scotch touring" in the hotel charges, which are amazing. "He that will to Cupar maun to Cupar," says the Scotch proverb. He may be "charged 'bed and attendance' for the privilege of extending himself on three chairs in a coffee-room, without a shred of covering beyond that which he carried on his person, and of being woke up by the arrival of the mail at 3 P.M." But he will have been at Cupar, or wherever it may be, and for the rest of his life can repose on the consciousness of the feat. Next to exorbitant hotel people, Mr. Baddeley objects to "the landed proprietary of Scotland, which is often opposed to the extension of tourist facilities." This opposition of the landed proprietary is based upon the laws which may or may not prevail in the planet Saturn (that comes within the ken of Mr. Gladstone's astronomical economy), but which certainly regulate the distribution of human wealth. An old Highland chief in Scott's time used to say that a laird's importance once depended on the number of clansmen on his estate, next on the black cattle, next on the sheep; "and I suppose," said the old man, "that we shall come down to reckoning rats and mice." This prophecy has not been exactly fulfilled: but now a laird's pleasure and wealth depend on grouse and deer. It is not in nature that he should like to have tourist "stravaguing" through his forests and over his moors. Mr. Baddeley says innocently, "We think that the sport has very little to fear from the number of tourists who would avail themselves of a free pass over all the deer forests in Scotland, if it were granted to them." Does he not know that that proud animal, the stag, will not even endure a shepherd near the wastes where he wanders, and in late October makes love and war? It is often provoking to be prevented from crossing a particularly beautiful expanse of heath or skirting a loch side in Scotland, because the deer must not be disturbed. Perhaps stalking is a "culpable luxury," but it has not yet been abolished by any Scotch Land Act, and while landlords gain pleasure and profit from their forests, they will be "opposed to the extension of tourist facilities." After all they are no worse than Wordsworth, whose opposition to the extension of tourist facilities we have commented on already. Mr. Baddeley, correctly we think, finds the chief charm of Highland scenery in the glens and in the coasts. As for the mountains he declares that there are "far too many of them. Their multiplicity is wearisome. . . . Scotch mountains are not individually strong enough to bear the constant and close competition which they carry on with each other." That is an English, and even a Cockney, view of the matter. Mr. Baddeley also surprises us by saying that the "fall of the leaf is fatal to the beauty of the glens." We should have said that the glens were never so lovely as in the fall of the leaf, when the red clusters of the rowan vie with the golden tresses of the birds and the innumerable tints of the bracken. But Mr. Baddeley holds that bracken is scarce in Scotland. Has he ever seen the West Argyllshire coast, when the snow lies brilliantly white on the hills, while the seas and skies are as blue and the sun almost as brilliant as they are on the Mediterranean coasts? He makes an exception "in favour of real winter weather," and probably only means that wet winter days, when all the leaves have fallen, are not very attractive in the Highlands, a proposition which even the patriotism of Professor Blackie could scarcely dispute.

In one respect—namely, his treatment of historical associations—we think that Mr. Baddeley really deserves to be handed over to Professor Blackie's tender mercies. The Professor would probably smoke him to death in a cave, or keep him in a pit, plentifully supplied with cold salt beef and finnan haddocks, but deprived of any but sea water, till he died of thirst. It was in these and similar ways that the grand old Celts satisfied their magnificent passion for revenge. And does not Mr. Baddeley deserve some such treatment? He speaks of the past of the Highlands, when the soil was rich in men, not in red deer only, with undisguised contempt:—

In the following pages we have touched as lightly as possible on those sanguinary episodes of clan history with which many of the most favoured spots in the Highlands are unfortunately associated. Healthy appreciation of a beautiful scene can hardly be enhanced by the knowledge that some desperate deed of rapine or revenge has been perpetrated in it; and, sooth to say, such deeds, best fitted for record in the pages of a "penny dreadful," form the staple commodity of Highland tradition. The stories, as told, contain no redeeming feature of either heroism or generosity, and we are much mistaken if, by their constant repetition, the character of the old Highland clans is not greatly traduced.

Is Ossian no better than the compiler of a penny dreadful? It is by remarks like these that the sentiment of a picturesque people is lacerated, and Highland innkeepers are driven to the wild justice of extortion. Mr. Baddeley has annoying passages like this,

"Then in a few miles we pass an old burial-ground called Tutnartoch, 'the place of great slaughter,' so named from a terrible clan fight some five centuries ago, wherein 'Mac met Mac' with the usual sanguinary consequences." Many even of his tourist-readers might be glad to know more of the great clan fight, and the names, at least, of courageous men who dwelt where now is solitude. Indifferent, apparently, to William Drummond and Ben Jonson, Mr. Baddeley remarks that "haunted Hawthornden" is haunted by card-sharps. He chaffs Scott's famous description of the chase in the *Lady of the Lake*, and observes, without regret, that "the historian would have had to substitute for Coilantogle Ford" "the great sluice of the Glasgow Waterworks." These are blemishes in taste, and show that Mr. Baddeley has a limited and very modern interest in the country he describes. But his maps, lists of Gaelic names, and general information are clearly, and, we think, adequately, drawn and compiled, and the book is handy and sure to be useful. Its defects will not prevent it from being popular.

#### LUCK; AND WHAT CAME OF IT.\*

THE author of *Luck; and What Came of It* is less wily than the common sort of novelists. He button-holes his critics in an introduction, wherein he advertises his work in terms at once explicit and ingenuous. He warns "the gentlest of gentle readers" that they are not to expect "any unconscionable amount of what is erroneously called sensation" from him; that they will "hanker" in vain "after details of bigamy, seduction, or mysterious murder"; and that it will not be theirs "to sigh over the unmerited afflictions of a beautiful governess," or "admire the all-but-superhuman skill, ingenuity, and cunning of a detective police officer, with more brains in his head than Lord Thurlow, or any other Lord Chancellor who even looked wiser than it was possible for any legal luminary to be." What the gentlest of gentle readers have to look forward to is "a plain, unvarnished tale" of "the loves, the hopes, the fears, the joys, the sorrows, the fortunes, the misfortunes, the ups and downs, the reverses and the successes, of the sons and daughters of an ordinary English household, told in language that, if unpretending, aspires to be good English, with every word in its proper place, and no words too many." If any of Dr. Mackay's incidents seem extravagant, it is the fault, not of his invention, but of "his perhaps too literal adherence to a fact which he knew to be a fact"; always supposing, that is to say, that "he or anybody else" can be said to "know anything to be a real, indubitable fact." This, he reflects, with peculiar caution, "is far more than the author would like to assert of anything." He goes on to observe that "anyhow" he "has not written the book idly, but with as much conscientiousness as any archbishop ever put into a sermon." The honourable boldness of this assertion is not to be gainsaid. Dr. Mackay, however, is afraid of its effect on the gentlest of gentle readers; for he hastens to add that he does not "consider his novel to be a sermon, or anything like one," and does not "wish any reader, gentle or ungente," to do so either. "Perhaps," Dr. Mackay opines, "like the epistle of Robert Burns to his 'young friend,' one of the finest of his immortal poems, there may be more of song in it than of sermon, and more of a faithful portrayal of the virtues and the follies of human life in our day and society than of either." And, with a light and sparkling cry of "*Vogue la galère*," he dates his work as gallantly as Balzac himself might have done; and the gentlest of gentle readers are launched on the swift current of his history without more ado. It will be strange indeed if some of them do not refrain from the adventure. They have heard their author's opinion of what lies before them, and the opinion is not altogether encouraging. In the hearing, too, they have discovered that Dr. Mackay has some knowledge of metaphysics, has heard of Lord Thurlow, is capable of misquotation, regards his English with decent pride, thinks lightly of archbishops and their sermons, has peculiar ideas as to the superfluous in words, and has not been able to make up his mind if his novel is a song, or "a plain, unvarnished tale," or a "faithful portrayal of the virtues and the follies of human life in our day and society." And to the practised novel-monger information of this sort is the reverse of reassuring.

Dr. Mackay's story is one of lost heirs and strawberry marks. Its principal personages are the Hon. Archibald Haughton, miller and maltster, and manufacturer of agricultural instruments; his wife, Jennie, *née* Ruthersford of Knockshoggle, who speaks an "incurable Doric"; his son, Herbert, a young man with a turn for sculpture and original ideas on the subject of marriage with models; his nephew, Lancelot; and his two daughters, Euphemia and Ettie, the latter of whom expresses herself in a mixed dialect of English and slang, while the first—a being full of sentiment, Shakespeare and the musical glasses, and "literary aspirations"—delivers herself in the stately and sonorous language of her author himself. The hero is a certain Oscar Lebrun. Oscar, who is Mr. Haughton's foreman, is "a well-made man," with "an aristocratic air and bearing . . . the grace of a gentleman, who seems to have been born a gentleman, and to be maintained in that rank by his innate qualities and not by externals." He is a Frenchman and a Communist, but he "speaks English as well as any Englishman," being much given to the use of poly-

syllables, and to the employment of "like" as a conjunction. A child of the awful "Mary Ann," he plays the piano in his leisure hours, and nourishes a secret passion for the gifted Euphemia, which impels him to blush when he meets and doffs his hat to her. Euphemia is deeply touched by these manifestations of sentiment, and is not slow to entertain a secret tenderness for their author! The Haughtons are encountered first of all in Paris. There, "some five or six weeks before the close of the Parliamentary Session of 1869," in the reading-room of the Hôtel du Louvre, Mr. Haughton is seen in the act of "awaiting the dilatory proceedings" of Mrs. Haughton and the girls, to whom he is engaged for "a little dinner in the Palais-Royal," and of being recalled to England by telegram to contest the borough of Swinston in the Liberal interest. From Swinston, where the bells "ring a merry peal" for the Liberal victor, the Haughtons move to London, where the head of the house, after taking the oaths and his seat, and shaking hands with the Speaker and Mr. Glynn, "the urbane and accomplished whip," dines solemnly—"by invitation," indeed—with the speculator, John Rigglesby, M.P. for Kilmacnoise, Lord O'Monaghan, a needy Irish peer, and his own brother, Colonel Haughton, and he is pictured to us drinking Romance Conti, and bearing an active part in many pages of elaborate, but tedious, conversation. From London the family proceed to Oban, *via* Edinburgh, at which city they are found shopping in Princes Street, and putting up (for the sake of local colour) at "MacGregor's Royal Hotel." These exciting experiences over, they "take the train to Greenock, avoiding Glasgow, and between nine and ten in the forenoon find themselves snugly on board the steamship *Zoua*, amid a motley multitude of people bound for Ardrishnig and the west coast." At Oban they are joined by Rigglesby, who persuades Haughton *pire* to invest 20,000*l.* in one of his banks, and by the O'Monaghans, who determine to marry Ettie; and they indulge in intellectual talk to an extent unparalleled in fiction. Of course they steam to Staffa and Iona. It is a solemn and improving passage. "Euphemia Haughton had been a diligent reader of the poetry and romance of Sir Walter Scott, and these scenes, familiar to her imagination, burst upon her delighted eyes in all their physical reality, infusing her whole being with a sense of joy and of anticipation realized, with which she found no one to sympathize so completely as her brother. He, with an artist's eye," &c. They gaze with rapture on "the ancient castle of Duart" (the scene of an incident "commemorated by Thomas Campbell in his *Ballad of Glenara*, and by Joanna Baillie in her tragedy of *The Family Legend*"), and on Ardtornish, and Aros, "and many other castles celebrated in immortal verse" besides; and, as they gaze, Euphemia reads "from Anderson's *Guide to the Highlands*—a model of what a guide-book ought to be—a general description of those robber eyries, those picturesque remnants of times and manners long since passed away." Soon the steamer is found "breasting the wild waves of the Ardnamurchan shore," while Mr. Haughton plunges into conversation with a German professor. The talk gets more intellectual than ever, the Professor going so far as to quote the Gaelic root of "Staffa," and to say of Dr. Johnson, a writer of whom Dr. Mackay does not approve, "Er war ein dummer Feel." At Staffa "the ladies light up the whole scene with the brilliant colours of their costumes"; and Euphemia presses her brother's hand, and whispers, "This exceeds all I had ever imagined." Straightway "a venerable person, who looked like an English clergyman," proposes that "the whole party should join in the Doxology," and, "leading off in a deep sonorous voice," is "quickly joined by nearly all present," Euphemia especially distinguishing herself, and asserting her claim to the poetic temperament with great success. On the return journey the Professor comes brilliantly to the front again, bursting with valuable information and the profoundest reflections. A casual thunderstorm has no sort of effect on him, though Rigglesby well nigh dies with fright. He enjoys the "uproar of the elements" in an intellectual manner, and he discourses eloquently of literature. "How I envy England the possession of Shakespeare and Byron," says this un-German Teuton. "My country has no writer that can compare with either of them, and I am afraid it never will. We cannot even match Robert Burns, whose Tam O'Shanter rivals Shakespeare, and stands unsurpassed for its beautiful blending of the grand, the tender, the humorous, the grotesque, the awful, and the horrible, pervaded by a strong undercurrent of wit and common sense. But, look! how this flash has lighted up earth, and air, and sea! Beautiful—exceedingly!" The statement that it is the function of "undercurrents" to "pervade" is one, by the way, well calculated to produce a weird and disturbing effect on ordinary minds, even though it proceed from a German Professor in a thunderstorm. But the Haughtons are used to this sort of thing at home, and like it. The German Professor imparts some pages more of information, and then disappears into space. Perhaps he was no German Professor at all, but only the author in disguise. Be this as it may, the Haughtons treat him with great consideration, and return to Swinston much the better for their trip.

After this affairs get brisker, and Dr. Mackay's facts begin to come in in good earnest. Rigglesby runs away and covers his retreat with a pretended suicide. He dies in a thunderstorm years afterwards. It is discovered that he has spent his shareholders' millions in returning men to Parliament; a fact that reflects great credit on the acquisitiveness of the British Voter. The O'Monaghan borrows money of Mr. Haughton, and throws Ettie over for a rich widow; and for some time that maiden nurses in her gentle breast hope that her papa will be

\* *Luck; and What Came of It*. By Charles Mackay. 3 vols. London: Allen & Co.

able to put the "horrid man" in prison for debt. Meanwhile, an Inman steamer goes down in mid-ocean, and the head of the Haughtons is on the point of becoming Lord Ravelstone and of inheriting a hundred thousand pounds. Ere he does so, however, he requests that search be made for the issue of an elder brother of his, who had married and died in France. Search is made accordingly, and a rightful heir turns up in the person of Oscar Lebrun, whose ambitious English and aristocratic bearing are thus accounted for clearly enough. Oscar has already told his love in polysyllables, and in polysyllables has been informed that his feelings were reciprocated; but at the moment of his accession to the peerage he is in Paris, hard at work for the "Mary Ann," and helping on the ruin of the Bonaparte family. He scorns his new-found title, of course; but it occurs to him that, if he persists in Communism, he will have little or no chance of exchanging oratorical vows with his Euphemia. He at once resigns his post as a regenerator of society, and takes to carrying a sword-cane and a revolver; and soon afterwards he is shot down in Great Gerrard Street, Soho, and taken up for dead. All comes right in the end, however, and the correct Euphemia and the noble Oscar are duly made one. It is interesting to know that, in celebration of this auspicious event (as Dr. Mackay might say), "the bells of Swinburne ring merry peals" once more, and "largesses were given to all the local charities." It is cordially to be hoped that Lord and Lady Ravelstone are more entertaining to each other than Dr. Mackay has been able to make them to his readers, or they must certainly have found the state of marriage tedious.

In an underplot we are told of the loves of Lancelot Haughton and a farmer's daughter, Patty Tidy. Lancelot's story is more amusing than Oscar's, but it is not amusing enough, and even in the gentlest of gentle readers it will awaken nothing like enthusiasm. Doubtless Oscar was a meritorious young man, and thoroughly deserved his peerage and Euphemia; but, as nothing seems to have come of his "luck" but a very dull fiction, it seems almost a pity that he did not cling to the Commune, and get shot by some of Gallifet's troopers after the burning of Paris. As for Oscar's historian, it is evident that, write as he may, whether "idly" or with archiepiscopal "conscientiousness," he is far from entertaining as a novelist. He has done excellent work in his time, and it is matter for regret that he has been so ill-advised as to venture outside his peculiar province in letters, and to tempt fortune with a book so faulty and so uninteresting as *Luck; and What Came of It*. Dr. Mackay speaks with great scorn of Miss Braddon and Mr. Anthony Trollope. But most of those who read him will rate his claims to superiority very lightly indeed, and will feel inclined to wish, for their sake and his own, that he had done more to establish them than he has in the present publication.

#### MORSEHEAD'S HOUSE OF ATREUS.\*

MR. MORSEHEAD'S translation of the *Agamemnon* was noticed by us on its first publication, along with Mr. Browning's extraordinary "Transcript," which happened to appear at the same time. He has now completed the work by adding the two other plays of the Oresteian trilogy; and we may say with greater confidence, having the whole before us, what we said of the first instalment, that Mr. Morsehead has achieved one of the most successful of English verse translations from the Greek. He combines qualifications unhappily not always found together—scholarship up to the modern standard, poetical feeling, and a command of dramatic and natural English. The example of living English poets enables a translator at this day to extend his power by using archaisms and uncommon metrical forms with much more freedom than would have been practicable twenty years ago. Mr. Morsehead has wisely taken advantage of this. Much of his work in the choruses and lyric dialogue shows that he has studied Mr. Swinburne and Mr. Morris diligently, though not servilely; and, Mr. Swinburne being a devoted student and imitator of *Æschylus*, this was not only reasonable and natural, but specially appropriate. We do not profess to have minutely compared Mr. Morsehead's work with the half-dozen or more metrical versions of the Oresteia or of the *Agamemnon* which already exist, and of which two or three have great merit. But we know enough of them to feel justified in saying that Mr. Morsehead, while he yields to none of his predecessors in scholarship, has excelled them all in endowing his reproduction of *Æschylus* with the force and living spirit of English poetry. To attain this he has deliberately made some sacrifice of literalness. His English is never bald or tame. He will expand the sense of an important word rather than lose its power. In the choruses he has even renounced antistrophic correspondence, thus laying himself open to the charge of laxity at the hands of severe scholars. Our own opinion is, that in an ideal translation of *Æschylus*—the translation which Mr. Swinburne could give us if he would—the correspondence would be preserved. But, after all, the structure of a Greek chorus is a thing only half understood by scholars (for we have but a vague knowledge at best of the movements which the metrical systems accompanied, and which gave them their significance), and it is not understood at all by the English readers for whose

benefit translations are supposed to be made. Those who read Mr. Morsehead's verse without the Greek will never miss this feature. Those who do know the Greek will have it in the Greek, and will still find the translation acceptable as a companion to the original. It will not the less help them to grasp the poetical value of passages which, owing to textual and grammatical difficulties, it is difficult even for good scholars, reading them in the Greek, to appreciate as a whole with undisturbed enjoyment. This, we think, is by no means the least use of a good translation, and is particularly well supplied by Mr. Morsehead's.

We are dealing with a translator who can afford to be tested by difficult passages. Let us take one of Cassandra's speeches from the *Agamemnon* :—

ἐκ τῶνδε ποιικίς φημι βουλευέειν τινα  
λεόντ' ἀνάλκιν κ.τ.λ.—V. 1223.

Mr. Morsehead renders it thus :—

For this, for this, I say, there plots revenge  
A coward lion, crouching in the lair—  
Guarding the gate against my master's foot—  
My master—mine—I hear the slave's yoke now.  
And he, the lord of ships, who trod down Troy,  
Knows not the fawning treachery of tongue  
Of this thing false and dog-like—Low her speech  
Glozes and seeks her purpose, till she win,  
By ill fate's favour, the desired chance,  
Moving like Atë to a secret end.  
O aweless soul! the woman slays her lord—  
Woman? what loathsome monster of the earth  
Were in comparison? The double snake—  
Or Scylla, where she dwells, the seaman's bane,  
Girt round about with rocks? some bag of hell,  
Raving a treacherous curse upon her kin?  
Hark! for I hear her now, in aweless joy,  
Cry the stern cry that tells of battle turned!  
How fair, forsooth, to greet her chief restored!  
Nay then, believe me not: what skills belie,  
Or disbelieve? Fate works its will—and thou,  
Pitying, wilt say anon *Her tale was true*.

Any English reader can judge of the style and expression of this for himself; and those who will turn to the Greek will find that every point of the original is fairly made. Only one critical remark occurs to us, and that does not affect this passage standing by itself. The turning of an oblique into a direct construction in the last line of our extract is an artifice which Mr. Morsehead uses so constantly that, though perfectly fair in itself, it almost becomes a trick; and sometimes it is used on insufficient provocation, as in *Eum.* 691, where the words τὸ μὴ ἀδικεῖν are expanded into

Enjoining, *Thou shalt do no unjust thing.*

We are tempted to linger on various passages of the *Agamemnon*, such as Clytemnestra's speech over her husband's body, with its all but untranslatable note of triumph—

ἔσθηκα δ' ἐνθ' ἔπαυ' ἐν' ἐξερπασμένοις.

This is rendered by Mr. Morsehead—not without reminiscence of Mr. Browning in his happier moments—

All is avowed, and, as I smote, I stand  
With foot set firm upon a finished thing.

But we must pass on to the other plays of the trilogy. The *Choephore* is in one way somewhat easier for the translator than other Greek plays, for the very reason that makes it more troublesome to editors. Many of the lyric parts have come down to us, through the ignorance and blunders of successive generations of scribes, in such a state that we cannot say with anything like reasonable certainty what *Æschylus* wrote. There is reason to suspect that often the confusion has been worse confounded by rash attempts at emendation, and it is more than possible that the clue to the true sense and reading may be hopelessly defaced or lost. One process, not improbably commoner than we yet know, and a very destructive one, is the superseding of a rare word by an early gloss. The gloss itself is corrupted by clerical error, or is perceived by a later scribe to be inconsistent with the metre; in the latter case it is rudely emended without regard to context, or, it may be, the error is ascribed to a perfectly sound reading in the corresponding strophe, which is tampered with accordingly to the confusion of the whole passage. In this state of things all that can be expected of a translator is to give as best he can what he thinks on the whole the poet's general intention is most likely to have been; and this Mr. Morsehead has done with good judgment. We do not see that he has made use of an ingenious paper contributed last year to the *Journal of Philology* by Mr. A. W. Verrall, which contains in the first place a discussion of one of the most dislocated choruses in this play, and incidentally emendations of several other places in the Oresteia. Mr. Verrall's readings seldom fail to improve the poetical effect, and some of them are to our mind almost certainly right. Thus, in the *Choephore* Electra (or the Chorus?) describes Agamemnon's unhonoured burial :—

Aweless in hate, O mother, sternly brave!  
As in a foeman's grave  
Thou laid'st in earth a king, but to the bier  
No citizen drew near,—  
Thy husband, thine, yet for his obsequies  
Thou bad'st no wall arise!

Orestes replies with the bald and barely grammatical exclamation,

τὸ πᾶν δριμύς ἄλγας, οἶμοι,

which ought to mean, if it can, "Alas! it is our shame that thou dost speak" (Mr. Morsehead). Mr. Verrall, having amply shown

\* *The House of Atreus; being the Agamemnon, Libation-bearers, and Furies of Æschylus.* Translated into English Verse by E. D. A. Morsehead, M.A., &c. London: C. Kegan Paul & Co. 1881.

otherwise that *τὸ πᾶν* is a favourite corruption in the tragedians, and especially in this trilogy, conjectures

*ταφὴν ἀνιμῶν θεῶν, οἰμοί.*

*It was a felon's burial. Fie upon it!*

The reply becomes at once pertinent and pointed. Mr. Verrall's *τάφον* for *τὸ πᾶν* in v. 331 seems to us equally probable. His reconstruction of the choric ode aforesaid, at vv. 935-972, though too daring for an editor to adopt, contains material improvements of the sense which a translator might fairly profit by. However, Mr. Morhead could not be expected to go beyond the received text; and, indeed, his version may well have been written before Mr. Verrall's article appeared.

The chief difficulties in the *Choephore*, as we have said, are with the choruses. But Mr. Morhead does not relax his effort or miss his opportunities in the dialogue. Sometimes the ring of the best dramatic English is admirably caught, as when Orestes appeals to his countrymen as

Argive men,  
Minions of valour, who, with soul of fire,  
Did make of feneb'd Troy a ruinous heap.

So the short and stern exhortation of Pylades—

*ἀπαντας ἐχθροὺς τῶν θεῶν ἡγοῦ πλέον—*

is very happily given:—

Choose thou the hate of all men, not of Gods.

In the translation of the *Eumenides* the same excellence is maintained. The following extract from the last *stasimon* may be taken as a specimen:—

Know, that a throne there is that may not pass away.  
And one that sitteth on it—even Fear,  
Searching with steadfast eyes man's inner soul!  
Wisdom is child of pain, and born with many a tear;  
But who henceforth,  
What man of mortal men, what nation upon earth,  
That holdeth nought in awe nor in the light  
Of inner reverence, shall worship Right  
As in the older day?  
Praise not, O man, the life beyond control,  
Nor that which bows unto a tyrant's sway,  
Know, that the middle way  
Is dearest unto God, and they thereon who wend,  
They shall achieve the end;  
But they who wander or to left or right  
Are sinners in His sight.  
Take to thine heart this one—this soothfast word—  
Of wantonness, impiety is fire;  
Only from calm control and sanity unstirred  
Cometh true weal, the goal of every man's desire.

The translation, however, must be read as a whole to appreciate the fine perception with which the varying moods of the choric parts are realized, and the command of English verse with which they are expressed. It might have been an improvement to add a few notes calling the English reader's attention to the curiously technical character of the motive and argument running through the play. The dramatic subject is, in fact, the suit against Orestes for the slaying of his mother. It is taken up by the Erinyes as the supernatural avengers of blood, Orestes, who would have been one of the natural avengers, being himself the slayer. But otherwise the proceedings are strictly regular, and the ideas and practices of archaic criminal law are scrupulously observed. The saving "ballot of Athena," the casting vote which was never actually cast, is interesting as one of the earliest certain examples of a legal fiction. Probably this point of the Orestes legend was invented to furnish a precedent of indisputable authority for the humane practice of giving the accused the benefit of an equal division. The merely negative rule, that there could be no condemnation without a majority of condemning votes, did not satisfy the archaic legal mind. Something was wanted to turn the scale, and the *ψῆφος Ἀθηνᾶς* was opportunely discovered. The whole Oresteian trilogy, we need hardly add, is deeply interesting as an exposition of an order of religious and ceremonial ideas which was on the point of being broken up, or already breaking up, when Æschylus wrote.

#### MEMORIALS OF ROBERT SMITH CANDLISH, D.D.\*

THERE are perhaps many Scotch Freekirkers who will find it possible to read the whole of Dr. Wilson's bulky volume; other Scotchmen may read half of it; but we can scarcely conceive that an Englishman, unless he be a Calvinist and Presbyterian of the Scotch type, or unless it lie in the path of his duty as a reviewer, will be able to read even a quarter of it. Dr. Candlish deserved a biography, for with the exception of Dr. Chalmers he was the most prominent actor in the famous Disruption. The interval between the two men was certainly a wide one. There was something approaching to genius in Chalmers, which can hardly be said of Candlish; but he had a sufficiently distinctive character, and he did sufficiently notable work, to deserve a better biography than he has at length received, especially as he has waited longer for a biographer than some of his less eminent colleagues of the Disruption. The history of that epoch-making event in the ecclesiastical and religious life of modern Scotland has been related so often by Scotch historians and biographers, both from the

"Established" and the "Free" points of view, that we shall make no attempt to re-tell even the barest outline of it. In Free Kirk literature it is represented as the most magnificent, heroic, and self-sacrificing conflict of modern ecclesiastical history; in Established Kirk literature its heroes and saints are dwarfed into exceedingly cautious, canny, business-like, contriving Scots, who made very sure of their ground before they erected their new tents upon it. Its curious action upon England, or rather upon English Dissent, has never yet been fully traced out. The English Dissenting sects have been largely officered by Scotchmen, especially in the wealthy middle-class districts of London and the populous towns. The Scottish Disruption quickened their emulation, and the anti-State-Churchism, or so-called Liberationism, became, as it now remains, the prominent dogma—the *articulus stantis aut cadentis ecclesiæ* of the English Independents and Baptists, the successors of Owen and Tombes. The "Three Denominations," as the English Presbyterians, Independents, and Baptists had hitherto been content to name themselves, suddenly discovered that their proper title was "The Free Churches," and a similar exchange of old titles for grandiloquent new ones was in time adopted by every subdivision of Wesleyan Methodism, if not by Quakers, Plymouth Brethren, Salvation Armies, and the various anti-clerical sects. Mr. Miall was a sort of spiritual child of Drs. Chalmers and Candlish, and his unEnglish dogma of Liberationism was grounded upon conceptions of the State and of the Church which were fundamentally Calvinistic and Scottish.

Dr. Wilson's method of writing biography is the worst possible. He has filled his book, as a dustman fills his cart, by heaping into it everything which he can collect, without spending thought and time upon a comparative probation of the materials. Long speeches, which any reader with a serious sense of the value of time would omit if he found them in a newspaper, are solemnly reproduced. He even prints the Doctor's letters describing Mrs. Candlish's tic, details of illnesses, small domestic nothings, state of the weather, drives and railway journeys, and the most ordinary household gossip. We began to count Dr. Candlish's weather reports, as reprinted by Dr. Wilson, but gave up the task—they are so numerous, and are not in the least descriptive; while many of the letters, and excerpts from letters, contain scarcely anything more solid. Amidst the broken saucepans, old bottles, and general heavy rubbish of Dr. Wilson's biographical cinder-heap, many valuable details lie hid, and the student of the "sociology" of sect-formation will here and there find something to reward him for the trouble of the search. Dr. Candlish's life falls naturally into three parts—first as a Conformist, secondly as a Nonconformist, lastly as a formal Dissenter or Separatist.

Robert Smith Candlish was born at Edinburgh in 1806. His father had been intended for the ministry, but found the Scotch Calvinist confession too narrow, and he was too clear and honest a man to "preach doctrines which," as he said, "I do not believe." He turned to medicine as his calling. He was a friend and correspondent of Burns. Indeed, the poet spoke of him to Hill the bookseller as "Candlish, the earliest friend, except my only brother, that I have on earth, and one of the worthiest fellows that ever any man called by the name of friend." He married Jane Smith, whom Burns included among his six Belles of Mauchlin:—"Miss Smith, she has wit." She was early left a widow, with two sons and two daughters, and with a very narrow income. Robert was her second son. He was never sent to a public school, but was educated by his mother, evidently a woman of fine character, "to whom he owed more," as Mr. Urquhart writes, "than to all his other teachers." She had other pupils, boys and girls. His elder brother, James, was cut off by typhus fever just as he was about to enter on his duties as professor of surgery; his contemporaries predicted a distinguished career for him both as physician and professor, and the mother used to say "Robert was naething thoct o' so long as James lived." Robert excelled as an athlete, and long retained his passion for swimming, running, climbing, and football; to these he added rowing, which he acquired at Eton, whither he went in 1826 as tutor to a young baronet, Sir Hugh Hume Campbell of Marchmont. He had entered the University of Glasgow in 1818 at the early age of thirteen; his name often appeared in the prize-lists; amongst the efforts by which he earned this distinction we find a vacation theme on the controversy between the Nominalists and Realists, and best essays on the Roman Dictatorship, Roman Censorship, and the poetical character of Aristophanes as displayed in the conception and execution of the *Clouds*. We imagine that the liberal and unpuritanical traditions of his father must have survived for some time in the family, for the two brothers were not only passionate lovers of the dramas and amateur actors, but whenever any celebrated actors visited Glasgow the youths were taken to the theatre. He entered the Divinity Hall in 1823, and left it in 1826. A letter to some of the professors asking them "to send the most able young man they could recommend to go to Eton as tutor" procured for Robert Candlish his early acquaintance with England. The young Scotchman's criticisms of English school life are fresh and entertaining. His stay at Eton confirmed his prejudices in favour of the Scotch system of education. "There is not much work done here," he wrote in May, 1837. "What with Saints' days (for in regarding Saints' days they are very orthodox), Founders' days, Bishops' days, &c., they have had one or two holidays, besides half-holidays, every week, in consequence

\* *Memorials of Robert Smith Candlish, D.D.* By William Wilson, D.D. Edinburgh: A. and C. Black. 1880.

of which they get off half their verses as well as no small portion of their lessons. I do not see the benefit of their committing to memory so much as they do, more especially as they do not commit it perfectly. I think they read too many authors at the same time." He studied Barrow, whom he called his "model," read Bishop Horsley with warm admiration, and was very far from the Calvinism which he afterwards adopted. His letters from Eton to Scotland show his great anxiety that the Assembly of the National Kirk should break with some of its rigid traditions. "I hope for the credit of the Assembly," he wrote to Mr. Urquhart, "they will not be so selfish as to petition for the relief of Presbyterian Dissenters alone from the Test Act. Why not be consistent, and make the petition general? I wish they would add to it one for Catholic Emancipation. What a fine example of Christian charity and liberality would our Church then hold out to other Churches. But I fear we are still so bigoted as to wish only those of our own sect to enjoy perfect freedom and to be delivered from all civil disabilities." His language in later life was very different; he became one of the most frequent and acceptable of the public denouncers of "the Man of Sin," and Dr. Wilson gives long extracts from his fervid anti-Popery speeches. It is curious also to find that in early life he ventured to speak in defence of the patronage system. He held that it should not be altogether abolished, but that "the sale of it should be rendered illegal. I mean," he adds, "that it should be attached to the land, and, if possible, I should like to see some more effectual check than there is at present on the part of the people against its abuse." He left Eton for a short time in order to be examined by the Presbytery of Glasgow, but returned to fulfil his duties as tutor. His whole stay in England lasted nearly two years. In 1828 he was licensed as a preacher, and became assistant to Dr. Gavin Gibb, minister of St. Andrews, Glasgow, who was also Professor of Hebrew at the University. Dr. Gibb was evidently a "Moderate," and consequently obtains small notice from the biographer. Candlish himself was still far from being "Presbyterian True Blue," and probably still held the opinions he had expressed at Eton while reading *McOrie's Life of Andrew Melville*. "I cannot help smiling sometimes at McOrie's almost Quixotic admiration of the Reformers." He served next at Bonhill, as assistant to Mr. Gregor, a man of whom we should like to know more. Though he was "without much Evangelical fervour," as Dr. Wilson tells us, he had a rich fund of dry humour. After obtaining a curate, he refused to preach himself, to the loss of the people, as we should imagine. "What is the use," he asked, "of keeping a dog, and then barking yourself?" As a "Moderate," Mr. Gregor was a strict enforcer of morality, temperance, cleanliness, and other "deadly doing." One Sunday, after Candlish had preached, the old clergyman went up into the pulpit. The cholera was then about "first visiting this country," as Dr. Wilson says, and the aged pastor thought that he ought to give his flock a few useful hints about their self-preservation. His first point was cleanliness. "My friends," said he, "you may have heard of a substance that has been lately invented, called Mackintosh's patent cloth, which has the property of keeping out wet from the body. It has been found, however, that the wearing of this cloth is not very good for the health—while it keeps out the wet it has also the effect of keeping in the moisture of the body, and that is injurious. Now it stands to reason that a coating of dirt will have much the same effect as Mackintosh's patent cloth." His little sermon on temperance, which was aimed at the country gentlemen rather than at the poor, was equally pointed. "I used to think, my friends, that a glass of toddy after dinner was good for digestion. But I have come to have some doubt about it. You may have seen in the windows of apothecaries' shops various animal substances in glass jars, preserved in spirits. Now, if spirits have the effect of preserving animal substances, they can hardly be good for digestion. But you must not think it is only spirits about which you need be careful, for I can tell you that if you get drunk on port wine you will not be sober for a week." Candlish himself still had the dark reputation of being a "Moderate." When he was trying to obtain the Assistantship of St. George's, Edinburgh, "the vile report," as he himself wrote at this period, "the vile report of Moderation was revived." Perhaps his eagerness to purge himself of this eccentric calumny, which interfered with his advance in his profession, first moved him to turn his face in that direction which ended in formal Dissent. At his first entry upon his work as assistant-minister of an important church in the capital, he showed no trace of Nonconformity, still less of formal Dissent. He was loud in his praise of Dr. Chalmers for his "grand assertion of the great principle of a National Church." His view of Scottish ecclesiastical affairs was extremely pessimist. "The Church here," he wrote in February 1854, "is truly in danger. A Radical magistracy, and an infidel or semi-infidel population, urged on by our Political Dissenters—who seem to have merged their spiritual calling and their religious duties in the work of revolutionary agitation—these are formidable adversaries." By his passage out of the camp of the "Moderates" into the camp of the Evangelicals, Candlish himself soon became a revolutionary agitator. The stages of this change are not clearly defined by his biographer. It is evident that he fretted somewhat in his position as a mere curate. "These assistantships," he complained, "are not good. They give too much duty with too little weight. A man cannot tell what he is—he is neither fish nor flesh. He cannot assume the status of a minister, and yet he is in the situation of one." He had a call from the congregation of the Regent Square Presby-

terian Church in London, the pastorship of which "had become vacant by the removal of Edward Irving," and he showed his prudence by declining to succeed that brilliant but erratic giant. Thirty-four years later, in a funeral sermon on Dr. James Hamilton of Regent Square Chapel, Candlish said that he "narrowly escaped" being the pastor of the remnant of Irving's congregation; but the story as told by Dr. Wilson seems to show that his preference for Edinburgh was cool and deliberate. His assistantship did not last long. Young as he was, he soon obtained his coveted independence, and became incumbent of the important parish of St. George. Dr. Wilson gives him a high character as a parochial organizer; but it is evident that he soon began to regard the world, or at least Scotland, as his parish. He threw himself, heart and soul, with great physical strength, and with no ordinary powers as a casuist and debater, into the fight against patronage and the struggle for "Christ's Crown." We need scarcely say that he was inferior to his colleague Chalmers in pure eloquence. But the Free Kirk cause owes something to his early "worldly" culture and his boyish dramatic exercises; nature was against him, art and labour alone enabled him to overcome the screeching voice, the extravagant gesticulation, and the awkward manner which he at first exhibited in the pulpit. As a casuist, however, we are inclined to place him far before Chalmers. Both these eminent Disrupters had been passionate advocates for the nationality of the Church. When the logic of events forced them to become formal Dissenters from the very Church whose nationality they had hitherto asserted, they had to provide themselves and their fellow-separatists of the Free Kirk with a pseudo-nationality. The new Society which they had created had not merely to assert, like other sects, that it was the true Church of Christ; it had also to declare itself the genuine and ancient and historical Church of Scotland. To cut a branch off an oak, and then to prove that it is the original tree, and that the old trunk itself is a mere schismatical offshoot, is a hard task for the most facile of casuists. Dr. Candlish was a thoroughly honest man, but we find it difficult to understand how his quaint arguments could ever have satisfied himself and his fellow Freekirkers. In 1855, twelve years after the formation of the Free Church, during a propagandist campaign, Dr. Candlish solemnly made the following statement at a public meeting in Glasgow:—"The date of the existence of the present Established Church of Scotland is 1843. The date of our existence is 1560." The rationalistic free-handling of Holy Scripture in the Free Kirk of 1881, at which the doctrinal successors of Chalmers and Candlish are staggered and appalled, may possibly be the natural outcome of Dr. Candlish's rationalistic free-handling of chronology and history at the beginning of the movement. His free-and-easy elaboration of his amazing chronological hypothesis is simply a statement and not an argument. Each old Established parochial kirk was to be doubled by a new Free parochial kirk, and each old Established manse by a new Free manse; and the Scottish people were to be urged to extinguish the debts contracted by this wholesale and ubiquitous sectarian competition upon the plea that the new kirk was the old one, and that the old kirk was a new one. "We can trace our unbroken pedigree," said Dr. Candlish, "through many vicissitudes, trials, and persecutions, from that eventful year when first the General Assembly met in Scotland; by all the historical signs and marks which can possibly identify a national Church, we can certainly trace our descent, far more clearly than any bishop can trace back his to the apostles. That being our position, we are not, in the exercise of any false or spurious charity, to be found for a moment admitting that the Established Church as it now exists is a Church of older date than the last thirteen years." On these novel principles of destructive historical criticism, it is evident that if the Ritualists, or the Evangelicals, or the Latitudinarians were to take themselves out of the Church of England in 1881, and set up a new communion, the actual and ancient *Ecclesia Anglicana* of the great Charter and the Act of Uniformity would immediately enter upon the first year of its existence. There was a hard grain of logic in the midst of this egregious assumption of the Freekirkers that a runaway daughter is three hundred years older than her mother. After asserting that the wholesale excommunication of a tercentenarian Established Church by an infant Free Church was "entirely consistent with the purest and widest exercise of Christian charity," Dr. Candlish added the one only true remark in his apology for the Scottish schism: "but, be that as it may, they are the views which, in consistency, the Free Church must hold, maintain, and avow in the face of all the world." There can be no doubt of it, and the fact that such an hypothesis was demanded by their position is the severest possible condemnation of that position. The creation of the Free Kirk, which looked superficially like a gorgeous outward triumph of the Scottish-Calvinistic theory of the Church, synchronized with the internal breaking-up of Scottish Calvinism. Three years after the formation of the new Kirk, J. M. Campbell wrote to Thomas Erskine, "The Calvinism of Scotland is breaking up fast." We take leave to add that the break-up is significantly perceptible in that very community which was separated and organized with the very object of perpetuating the Calvinism of Scotland.

## RECENT POETRY.\*

IN reviewing Miss Robinson's *Handful of Honeysuckle*, three years ago, we drew attention at once to the singular promise of that remarkable little volume, and to the danger which its author ran in imitating the foibles and weaknesses of a mannered school. The original poems which follow the translation that heads our list prove unmistakably that the poetess has listened to the voice of her more sober critics, and has not been intoxicated by the chorus of praise which greeted her first book. Miss Robinson has yet much to learn and to gain before we can accept her as one of the recognized band of living English poets; but we may truthfully say that there are not many candidates for this honour, among the younger generation, whose work is more interesting and promising than hers. Perhaps the best sign about her new book is that she has completely broken away from the pretty affectations that gave her first book vogue with a certain class of readers, but which made others doubtful of her final success. That she has chosen to herald her new poems by a translation of one of the tragedies of Euripides is probably nothing more than a desire to emulate the poetesses of the generation immediately preceding her own, and to claim no less proficiency in Greek than has been proved by Mrs. Browning, Miss Anna Swanwick, and Mrs. Augusta Webster. The translation has been well carried out and carefully revised; in limpid style and general success of treatment it equals the performances of the ladies just mentioned, and presents, on the whole, a very creditable waste of energy, and a very uninteresting display of talent. But the "Red Clove," the first of the original poems, restores us at once to attention and vivacity. It is a versification into *ottava rima* of a strangely pathetic and ingenious story by the old novelist Giraldo Cinthio, and is in every way a remarkable piece of writing. The vigour of narrative style, the tenderness of touch, the feminine intensity and delicacy of passion, which inform this little romance of fifty stanzas give us a right to expect excellent work from Miss Robinson in the future. No recent poet, no verse-writer since Mr. Morris, has told a story so fluently, and her manner is entirely different from that of Mr. Morris. Among other narratives in verse we commend the suitably story of "The Gardener of Sinope" more than the ballad of "Captain Ortis' Booty," which is too much in Mr. Browning's manner. "The Lake of Charlemain" is a very striking piece, and in "Una Selva Oscura" we find a reverie of great beauty and solemnity. Some of the sonnets are of a very high merit. On the other hand, "On a Reed Pipe" seems to us weak and insincere, and the series of "London Studies" almost puerile. It is plain that, although Miss Robinson has made a great advance in her art, she is still not perfect in it, and in a purely lyrical sense we find nothing in the new volume quite so good as "And shall I weep that Love's no more?" But all readers of poetry should turn to the "Red Clove," one of the most charming contributions to poetic story that we have met with for a long while. We have space only to quote the closing stanza:—

For long she lay alone below the shade  
Of laurel trees that yet her memory keep;  
Since never again her husband came, nor made  
Atonement for a woe too grave and deep.  
She lay alone till mourning lovers laid  
Her true Antonio in her tomb to sleep;  
And they that buried him beside his love  
Found, on the shapeless dust, a blossoming clove.

In reviewing *Bible Tragedies* we pass, as Mr. Swinburne would say, from "the youngest to the oldest singer, that England bears." Mr. Horne has been before the public so many years, and has reaped so many honours, that he can hardly expect us to exercise our privilege of criticism upon his latest work with complete freedom of speech. That the octogenarian poet should still write at all is in itself a marvel; that he should write so well is singular indeed. There is no prefatory note to tell us that either of the three dramas here presented to us has been printed before, but all students of literature will be aware that the third, "Judas Iscariot; a Mystery," is a reprint of *Judas Iscariot; a Miracle Play*, published, with other poems, as long ago as 1848. This is recognized as containing some of Mr. Horne's finest passages of blank verse, although from the nature of the story, and the bondage which a Scripture theme inflicts upon a dramatist, not so many of his vigorous tragic situations. In comparing the text of 1881 with that of 1848 we do not find that many alterations have been made; what have been adopted refer mainly to the first act, and consist in concisions and a few slight additions. We are glad to see that the noble close of the tragedy, the dramatic agony of Judas, remains unaltered. Nothing that Mr. Horne has written surpasses this final soliloquy in grandeur and passion; nothing proves him to be so near in kindred to the great Elizabethans. We cannot say that the two new dramas equal *Judas Iscariot* in poetic fire. *John the Baptist* is too closely moulded upon the words of Scripture, which lose alike their dignity and their force by being dragged into the very body of blank verse. But it con-

tains some charming choral passages, as this, spoken after John's decease by his sorrowing disciples:—

We followed thee, like moens that turn  
Around a planet, and receive  
The orbit course wherein they live,—  
Pure fire in each transparent urn,  
Which glorifies, yet does not burn.

And this, which is full of Mr. Horne's peculiar manner of thinking and writing:—

The prickly-pear's bush clumps the shore,—  
Rich carmine movements fill its breast,—  
The mastic, cypress, sycamore  
Have inward currents without rest:  
The shell-fish, close-lock'd, graved in sand,  
Beneath the wave knows sea from land,  
While in deep darkness tremulous,—  
But nothing moves in John's dark house!

For "Rahman," an apocryphal book of Job's wife, written in chapter and verse, after the manner of the Authorized Version of the Bible, we have no sympathy. We regret that Mr. Horne should have allowed himself to be persuaded to publish what, in spite of the author's genius, is no more fit to be regarded as literature than the *Proverbial Philosophy* or the translation of the Book of Jasher.

Among those who take verse to be their friend, and not their mistress, and cultivate an elegant accomplishment rather than follow an irresistible impulse, Professor Nichol takes a high place. He has practised poetry, as the dates of the pieces in his present volume prove, from early youth, and he is almost too well equipped in all that forethought and scholarship can secure for him. His verses are severe, intellectual, and interesting; but they are rarely moving, and perhaps never charming. They move stiffly, without speed or fire; and the reader never turns back to a piece that he has passed to secure a repetition of a remembered pleasure. Yet it would be unjust to deny the great merit of such a sustained exercise in blank verse as *The Death of Themistocles*. Like the *Hannibal* of the same writer, it never sinks to poverty of expression, never soars into bombast; it is dignified, careful, conscientious work throughout. The smaller pieces are less to our taste; and a quotation from the "Epilogue," which is one of the cleverest of them, will give a not unfair idea of Professor Nichol's poetical manner at its best, as well as an indication of the causes of his general failure:—

Aphrodite wooed and won me, rising roseate from the sea,  
When the spring of life was flushing, and the fresh blood throbbing free;  
Swift-heeled Hermes, bright thoughts bringing, Phœbus, wars and  
wisdoms singing,  
Twining Nymphs and Graces lured me, ere my longing set on thee:  
Donna Vera, Donna Vera!  
Then the solemn gloom and glories of the dim transition days,  
Vestals chanting Roman anthems, Covenanters, Hebrew lays—  
Broken fragments of thy meaning, simple Faith's impatient gleaning—  
Held me in religious rapture, till thy Presence broke the maze,  
Donna Vera, Donna Vera!

This is all very well; but this is not the temperament of the poet. The poet remains a child in love, in faith, even in disregard, sometimes, of "Donna Vera." Professor Nichol is grown up, he is a disenchanted adult, and for this life at least he cannot take the poet's place, and "become as a little child." There are some heights unattainable even to the robust sceptic.

The four volumes that lie before us to-day are curiously distinct from one another in aim and quality, while alike in possessing merits that lift them far above the ordinary average of current verse. But the anonymous author of *Dorothy* has produced a poem that is so unique in form and matter that, in comparison with it, Miss Robinson seems to be a lyrist of the school of Professor Nichol, and *The Death of Themistocles* undistinguishable from *Judas Iscariot*. The story and the treatment alike are homely in the extreme, as homely as those employed by Clough in the *Bohio of Tober-na-Fuolich*, but they are sustained and illuminated by at least as much distinction of style. Dorothy is a maid of all work at White Rose Farm, where she was born of a mother as humble as herself, whose beauty had betrayed her to a young man of fashion staying for the shooting at the Castle hard by. The daughter has inherited the refinement of the father combined with the lovely features of the mother, and possesses a gravity and depth of character that is all her own. The head gamekeeper, Mr. Robert, falls in love with her and marries her, after her having successfully withstood the wiles of the nephew of her unknown father. The plot is very slight indeed; the merit of the poem consists in its accurate and incisive studies of country life, which reveal a new landscape poet, and in its exquisite use of dialect in familiar conversation. As long as the rustic characters are alone together there is not a fault in truth of tone, but the gentlefolks are more conventionally drawn. It is very difficult to quote with satisfaction from a poem that rests its claim to our attention not on workmanship, but on interest of narrative and sustained freshness and vigour. But this picturesque description of ploughing may perhaps be separated from its context with as little injury as any other:—

Oh, how delightful to see the exquisite sweep of the furrows  
Climbing in regular lines over the side of the hill!  
Stretching in beautiful curves, as it seems at a distance, but really  
Straight as the strings of a harp; ranged in great octaves, like them.  
For you shall see, in the sun, all purple and steely and shining,  
Ranges of long bright lines, all of them strictly alike;  
But at the end of each range, at equal intervals always,  
Comes a great deep base line, carved like a trench—as it is.

\* *The Crowned Hippolytus*. Translated from Euripides. With New Poems. By A. Mary F. Robinson. London: C. Kegan Paul & Co.

*Bible Tragedies*. By Richard Hengist Horne. London: Newman & Co.  
*The Death of Themistocles; and other Poems*. By John Nichol. Glasgow: J. Maclellan.

*Dorothy: a Country Story in Elegiac Verse*. London: C. Kegan Paul & Co.

*Poems*. By Oscar Wilde. London: David Bogue.

**Masterly art, in its way, and noble, the art of the ploughman!**

Well might our Dorothy feel proud of its glory and joy!  
For she was ploughing too; in the cool sweet air of October  
She too was out with the morn, scoring the slopes of the hill.  
Under a hedge by the wood stood her plough, with its yoke-tree of scarlet—  
Symbol of all good work—waiting till Dolly should come;  
Till she had harness'd the team, and with Billy the boy to attend her,  
Rode on the foremost horse, fresh for her labour of love.

The rural part of the poem would be almost perfect, if it was not for a certain slightly vulgar insistence on the horny palms of the heroine. We easily grant to the poet the hard hands of his Dorothy, but we do not like to have them thrust upon us on every occasion. Yet the poem is original and beautiful, and seems to us sure of retaining a place in the minor poetical literature of the age.

Mr. Wilde's verses belong to a class which is the special terror of reviewers, the poetry which is neither good nor bad, which calls for neither praise nor ridicule, and in which we search in vain for any personal touch of thought or music. The author possesses cleverness, astonishing fluency, a rich and full vocabulary, and nothing to say. Mr. Wilde has read Messrs. Tennyson, Swinburne, Arnold, and Rossetti with great pleasure, and he has paid them the compliment of copying their mannerisms very naively; indeed, it might be fairly said that his book is little more than a cento of reminiscences from these poets. The great fault of all such writing as this is the want of literary sincerity that it displays. For instance, Mr. Wilde brings in to his verse the names of innumerable birds and flowers, because he likes the sound of their names, not because he has made any observation of their habits. He thinks that the meadow-sweet and the wood-anemone bloom at the same time, that that shy and isolated flower the harebell "breaks across the woodland" in masses "like a sudden flash of sea," and that owls are commonly met with in mid-ocean. But worse than this profuse and careless imagery is the sensual and ignoble tone which informs a large proportion of the poems, and for which the plea of youth is scarcely sufficient excuse. So much talk about "grand cool flanks" and "crescent thighs" is decidedly offensive, and we have no wish to know that the writer ever "paddled with the polished throat" of his lady-love. The book is not without traces of cleverness, but is marred everywhere by imitation, insincerity, and bad taste.

#### CALENDAR OF STATE PAPERS, DOMESTIC SERIES, 1640.\*

**MR. HAMILTON**, in his preface to this volume, has barely exceeded the two-score and ten pages to which he was limited by the official economy of the Master of the Rolls. But his elucidations, with the exception of a page or so on the not very novel topic of publishing the debates of the Houses, contain nothing that is superfluous. Among the many reflections which naturally suggest themselves as one turns over the records of such a time as the first two-thirds of the year 1640 were to England (for we are not here taken beyond the month of August), is the trite thought how well it is for men not to be able to see into the future awaiting them. People must eat and drink, and marry and give in marriage, and talk scandal about the Romish inclinations of the Archbishop of Canterbury, and nonsense about Platonic love, even though there is gloom in the heavens and a trembling, as of a coming storm, in the atmosphere around. But to keep a high heart and an unshaken spirit in the midst of signs and warnings crowding upon one another like the trees which marched against Macbeth—to insist, for instance, as Strafford did, upon the vigorous conduct of a war which he had deemed it impolitic to begin—this is impossible without a hopefulness which nothing but ignorance of the future can either explain or justify. For us, who are wise about the past by no merit of our own, there is of course a peculiar—what Thirlwall might have called an ironical—interest in becoming better acquainted with the hopes and the schemes, the passions and the delusions, of such a time; and, as these are successively recalled, many opportunities present themselves for indulging in that irresistible kind of historical speculation—an inquiry whether things might not have been better managed with a little more foresight, such as time has *ex post facto* vouchsafed to us.

It can hardly be denied that hitherto considerable obscurity has surrounded one of the most memorable episodes in our Parliamentary history—the dissolution, after a Session of three weeks, of the so-called Short Parliament. It is of course well known that the King's object in summoning that Parliament had been the obtaining of supplies for his projected renewal of the war against the Scots, and that this object was defeated by the refusal of the Commons to vote supplies until their grievances should have been debated and redressed. It is likewise well known that, in appealing to the Parliament for assistance "against the rebellion of his subjects of Scotland," King Charles and his counsellors hoped great things from the moral effect of the production of evidence bearing on what Olarendon calls the "activity" of the Scots "with foreign princes," and more especially of the famous letter purporting to be addressed by Scottish nobles *au roy*; but that the Commons received these revelations with the utmost indifference, and could not be persuaded to treat them as decisive elements in the situation. What, however, is now for the first time shown to be at least extremely probable is that the assembly summoned to make possible a war against the Scots very nearly

ended by blessing them altogether, and that a consequent desire to avert such a catastrophe prompted the King, *while the matter of the supplies was still undecided*, to dissolve the Parliament.

Though Charles I. saw more clearly than his English advisers the seriousness of the Scottish rebellion, he was as blind as they to the temper of the English constituencies, and therefore to the probable result of the elections. May and Olarendon are at one as to the sobriety and moderation displayed by the new House of Commons. To how great an extent it was composed of gentlemen of position is manifest from the fact that a serious difficulty was apprehended in carrying on the military preparation throughout the country during the absence at Westminster of so many deputy-lieutenants and justices of the peace. Grievances might accordingly be expected to be well represented, even if members were not always furnished with so direct a commission as the two representatives of Northamptonshire named in the following petition of the freeholders:—

That of late we have been unusually and insupportably charged, troubled and grieved in our consciences, persons, and estates by innovation in religion, exactions in Spiritual courts, molestations of our most Godly and learned ministers, ship money, monopolies, undue impositions, army money, waggon money, horse money, conduct money, and enlarging the forest beyond the ancient bounds, and the like, for not yielding to which things, or some of them, divers of us have been molested, distrained, and imprisoned. We have entrusted John Crewe, Esq., and Sir Gilbert Pickering, Knt. and Bart., chosen Knights for this country, to present these our grievances, desiring you to take them into your consideration, and that they may for the present be redressed. And that it may be so ordered that we may have a Parliament once a year, as by law we ought, 4 Edw. iii. stat. 4, 36 Edw. iii. stat. 10, for preventing the like inconveniences for the time to come.

None of the complaints so glibly enumerated in this document were likely to be forgotten by the majority of the new House of Commons and its eloquent leader—least of all the religious grievances, which in truth he placed in the forefront of the most famous speech of the Session. The Puritan sentiments of the majority, which might have furnished a sufficient index of the view likely to be taken by the House of the Scottish difficulty, can have been no secret; but the degree of importance attaching to them may have been still considered open to doubt. Indeed it may be that the Court party had not yet come to understand what Puritanism really signified as a positive force. The term was of course still a mere nickname, and, as a member of the Short Parliament told the House,

a word that must not be considered only as consisting of a few letters, but according to the manifold use the Devil makes of it; for this word in the mouth of a drunkard doth mean a sober man, in the mouth of an Armenian [*sic*] it means an orthodoxian, in the mouth of a Papist it means a Protestant, and so it speaks to shame a man out of all religion if a man will be ashamed to be saved, and if this name be once put upon a man, you may lay hands upon him as upon St. Paul, 40 stripes save one, yea it is well if he escape whole with his limbs and members.

In itself the idea was by no means ill conceived, to secure the support of an assembly containing such elements as these by boldly appealing to its patriotic sympathies, and to leave over till after the subsidies had been voted the question as to what grievances should be taken into consideration. As Mr. Hamilton observes, this method of procedure—so far as order of sequence was concerned—had been successfully adopted by Strafford in Ireland, where, however, the Crown possessed the sole right of initiating legislation. But in the present instance the fault of the deftly constructed edifice of hopes lay in the absence of a basis. Tractable as it might be or seem to be, this Parliament was not one to be either overawed or corrupted; and the appeal to its sympathies proved a mere *coup manqué*. When the Lord Keeper had produced the terrible letter to the French King, the Commons were obviously indisposed to take the worst view of it, and indeed were willing to accept some such innocent interpretation of its contents as Lord Loudoun had offered in the Tower, together with his plea of its being in any case covered by the Act of Oblivion. Even the hope which the "Cabinet Council" (or what was soon to be called so) based upon the seizure of the person who was to have been the intermediary between the Covenanters and King Louis broke down. In the first instance, the wrong person was arrested—James Colville instead of his brother William; and when by a stroke of luck (for the Earl of Leicester, our ambassador, had manifested a very pardonable slackness about moving in the matter) the right man was at last in hand, the time had long passed away for Parliamentary capital being made out of whatever disclosures might be elicited from him. The Crown, therefore, had to trust to ordinary means of action. When the great debate of the Session, carried on from eight in the morning till three in the afternoon, had concluded with a vote to the effect that a grant of supplies without at least a definite assurance of the redress of the principal grievances would be an example "dangerous to posterity," some amount of concession on the part of the Crown had manifestly become indispensable, unless an end was to be put to the present Parliament at once. And, in point of fact, after a very futile proposal to the Commons, and a singularly clumsy attempt suggested by Strafford to convert them with the help of a resolution of the Lords, a very considerable concession was actually offered. On condition of twelve subsidies being granted to him forthwith, to be paid within three years, the King promised not only to cease the levy of ship-money, but to consent to its utter abolition, besides undertaking to pay as much and as speedy attention as possible to grievances. It is quite clear that the House of Commons was unprepared to accept

\* *Calendar of State Papers, Domestic Series, of the Reign of Charles I., 1640.* Edited by W. D. Hamilton. 1880.

so restricted an offer; and it is very possible that Ministerial mismanagement, personally explicable or otherwise, failed to give effect to the wise proverb that, if a door is to be kept open at all, it ought to be kept open wide. At the same time, some special explanation seems necessary to account for the sudden dissolution, under circumstances betokening extraordinary haste, of the Parliament, before it had yet spoken its last word. Mr. Hamilton's papers, taken together with his comments, make it more than probable that the House of Commons had resolved upon recommending to the King a reconciliation with the Scots. It was, after all, the course which would have saved King Charles what he was destined afterwards to lose. But it was not in such self-humiliation as this that he gloried. He dissolved the Parliament with what one might almost be tempted to call an audacious grace, for (if Rosingham can be trusted) he

old both Houses he would command a free and a rich people, not denying his subjects either proprietary in their goods or liberty of their persons; and concerning their grievances, he believed there were some grievances in the Commonwealth, for his Majesty did not believe there could be any Government so perfect as to be without some grievances, which he would willingly relieve as well out of Parliament as in Parliament, which his people should find.

The comment of history upon the unfortunate King's blind self-confidence is not exhausted by the events of the summer and autumn of the year 1640. The raising of money was not to be the worst, as neither was it the most unaccustomed, of his difficulties; on the whole, the Aldermen of the City appear to have been as "dry and choky," and to have needed as much "pressing" ere they "yielded a great deal of fat oil" (to borrow Sir Kenelm Digby's irreverent expressions), before as after the dissolution. But how perilously to many of the King's truest friends the ground must have seemed to quake beneath their feet, when they gradually learnt with what soldiers the contest was to be waged in which the Parliament had refused to give material or moral support to the Crown. It appears that the total of the men in the trained-bands in England and Wales (with the exception of the Northern counties, which were, doubtless not without good reason, left out) amounted to little short of 80,000 men, out of whom 30,000 were to be taken for the King's army. If, however, the spirit in which the trained-bands in general responded to this proposal was that which appears in a petition sent up by those of two hundreds in Hertfordshire to the Deputy-Lieutenants, the levy itself must have been productive of bad blood. The excesses in which some of the pressed English soldiery indulged, as related by the vivacious pens of Sir Kenelm Digby and Edmund Rosingham, are all but incredible in their sanguinary violence; as Sir Kenelm very mildly puts it to Lord Conway, "Riillery apart, people are strangely disinclined and untoward, and you must wonderfully alter their dispositions to do anything of importance with them." Meanwhile, from across the border had come trustworthy "information written to the King," how that the Scots had "provided three for one they were the last time, besides their recruits they are preparing by daily training of men to that effect, so that they are minded to be 100,000 in all, besides their trained bands, which will be well armed and appointed ready to venture their lives in defence of their liberties, laws, religion, and families." No such enthusiasm could, from the nature of the case, be stirred up in the English soldiers, who suspected their very officers of being secret Papists. Perhaps Francis Windebank the younger (considering his family connexions) might have been so suspected with fair reason; but he at least was equal to the occasion, for he writes concerning his men that,

finding their humour, on their first day's march, I desired them all to kneel down and to sing psalms, and made one of my officers read prayers, which pleased them not a little; and, being very familiar with them at first, giving them drink, and stinking tobacco of 6d. a lb., I gained their love, so that they all swear they will never leave me—and indeed I have not had one man run away yet in this nine days' march; but other captains of our regiment, who marched a week before us, are so fearful of their soldiers they dare not march with them. I have all my men in so great obedience that all the country pray for me, saying they never met with such civil soldiers.

Mr. Hamilton, who has a particularly keen eye for characteristic details, has noted at the close of his preface several matters of interest incidentally occurring in this volume. The list might be increased; but we will content ourselves with referring to one or two passages connected with University history, of which one could hardly expect to hear much in such a year as 1640. But a tyrannical system of government is tyrannical in all directions; and nowhere were the encroachments of the Crown in the earlier as well as in the later Stuart reigns more bitterly resented than at the Universities. The Royal interference in the matter of appointments to fellowships is here illustrated in the case of Christ's College, Cambridge, whose scruples about obeying a Royal mandate moved the courtly anger of the Bishop of Ross. Elsewhere is a curious petition from the Principal, Fellows, and Scholars of Jesus College, Oxford, who, in accents which would go straight to the heart of Lord Aberdare's Commission, in the name of the principality of Wales ask to be allowed to annex a certain lane adjoining the College, which lane "at present is of no use but for beggars to nestle in who may be provided for elsewhere." Lastly, we have yet another petition, from the Mayor and Aldermen of Cambridge, for the restoration of Stourbridge fair (where in Skelton's day *Syllogisari* was drowned) to its home in Barnwell-fields, whence it had been banished for two years "because of the late plague in several parts of the Kingdom, especially London."

This was certainly vicarious penance, as in London itself (according to Collier) the prohibition of stage plays for the same reason had been taken off in the summer of 1638. Yet another year or two, and both London and Cambridge were to lose all thought of revels.

JAMES WOODFORD.\*

IT seems that Professor Seeley once made a request to Mr. Solly that he should write an historical sketch of the Chartist movement from his own personal recollections. This Mr. Solly, for what reason he does not state, "could not offer" the Professor; but he offers him instead this book. Professor Seeley was undoubtedly right in thinking that a history of Chartism by one of the few persons who, not being of the so-called working class, had something to do with it, would be a valuable contribution to historical literature. It is, indeed, not a little curious that no such history exists. There were, it is true, not many middle-class or upper-class sympathizers with the movement, which from the first identified itself with the blustering demagogism of Feargus O'Connor, the visionary republicanism of some of his more respectable associates, and the atrocious projects of the lower physical-force men. But there were some, and among them were men of intelligence and literary ability. Nor is the movement a thing of such a remote past that no survivors of these should be expected to be left. It did not begin much more than forty years ago; it is not much more than thirty since it ended. Probably the explanation of the fact is that the middle and upper class sympathizers with Chartism were almost of necessity either men of such weak judgment and small intellectual power that any such work was almost impossible to them, or else men of a sensitive and enthusiastic temperament, who were likely to be too disgusted by the miserable collapse of the movement to dare to take up in cold blood the history of their own disappointment and disillusion. However this may be, Mr. Solly produces a kind of *testamentum* from Lovett to his own connexion (as an outsider, it is true) with the movement as early as 1841, and says that a Lancashire mill-hand lately remarked, "Thao gentelfolk know nowt about us 'cept Solly; he do know summat." It is something, no doubt, to possess such a certificate of combined gentility and knowledge; but the fact hardly excuses Mr. Solly for giving Mr. Seeley the stone of a not very good fiction instead of the bread of a sober history.

The objections to which *James Woodford* is exposed are very serious ones. In the first place, it inevitably challenges comparison with *Alton Locke*, and as inevitably comes badly out of that comparison. The earlier book, with all its drawbacks, was the work, and in some respects the best work, of a writer who wanted but a little of being a great genius. Kingsley, with the artistic sense of a born man of letters, chose his hero so that he could make that hero speak and write as he would himself have spoken and written, without inconsistency. The book was written when the writer's sympathies with the subject and his powers of composition were both at their freshest, and it thus has an abiding interest which its sentimentalism, its characteristic inaccuracies of fact, and the collapse, only less memorable and remarkable than the collapse of Chartism itself, of the curious adaptation of Christianity, which the writer strove to establish, have not sensibly impaired even at this distance of time. *James Woodford*, on the other hand, purports to be the work of an illiterate carpenter, licked into shape by a beneficent editor. It is full of the cut-and-dried expressions which, in our own opinion (though we confess we cannot produce such testimonials to competence as Mr. Solly can), working-men use oftener in novels and on the stage than in real life. Its narrative, though not wholly devoid of interest, is clumsily managed; the characters are wooden and commonplace types, and, above all, the history and the fiction, Mr. James Woodford and Mr. Henry Solly are mingled in such a bewildering fashion that the reader, after trying for some time to separate them, is likely to throw away the book in a rage unless he has the conscience of a reviewer or an historical student, or, better still, of both together. The object—not a bad one in itself—appears to be to show the movement as it appeared to one of its cooler-headed and less enthusiastic partisans who had nothing special to complain of in his own condition, and was rather drawn in by the heat and passion of his associates than by any clearly understood convictions or plans of his own. This is a difficult situation to work out, and Mr. Solly has not overcome the difficulty. The drift of his book as it actually stands seems to be to show that the average Chartist, and by implication the average working-man, is, or, at any rate, was, such an utter fool that he can or would be made to join any senseless agitation which blatant speakers of his own class, and still more of a class above his own, instigate; that he is of so low a moral tone that jealousy of his equals invariably dislocates any combined movement for such agitation; and that he generally follows the loudest voice and the toughest lungs. It is true that James Woodford is of the Lovett faction rather than the O'Connor faction, that he utterly detests and abjures physical force, and so on. But what Mr. Solly has not made him show is that he had any reason to be a Chartist at all. Throughout the book there are vague allusions to tyranny; but it is not observable that Mr. Woodford suffered any. He

\* *James Woodford, Carpenter and Chartist*. By Henry Solly. 2 vols. London: Sampson Low & Co. 1881.

was once wrongfully imprisoned. But this was the result of an abominable plot on the part of some of his own order who were jealous of him, and the hated aristocrats were in no way responsible for it. He was dismissed from some work because he was a Chartist; but he got plenty more at once, and seems to have been a tolerably prosperous person from his boyhood when he came to London as an apprentice to his middle age, when we leave him a builder with hundreds of workmen—let us hope not a jerry builder. If he has no wrongs, neither have his friends. *Alton Locke* did, indeed, indicate in the sufferings of the tailors a *vera causa* for disaffection. But, according to Mr. Woodford, all his own associates could always get plenty of work at fair wages whenever they chose to keep sober, which in very many instances they do not choose. The ravings and denunciations of Mr. David Roberts, Woodford's friend, and the violent Chartist of the book, as Woodford is the moderate, become, therefore, not merely unsympathetic, but unintelligible. The fury in the words is perceivable enough, but the words are meaningless. The few passages of actual historical sketch are by a curious irony much the best, and those of the Newport riot, the Kennington Common meeting, and the Orange Street conspiracy (the last is unfortunately mixed up with fictitious matters) show that, if Mr. Solly had condescended to do what he was asked, something of not inconsiderable value might have resulted. But the unwillingness of persons who take their pens in hand to comply with the beseeching demands of their critics, and in cases where they are not great writers to content themselves with telling what they know, is sufficiently notorious already.

There is, as has been hinted, very little to say about the story. James Woodford and David Roberts are natives of the same village, work at the same trade, and, as we have said, have the same political views, though the Chartist disease is taken by one in the mild form and by the other in the virulent. They are also both in love with the same girl, though Woodford, finding he has no chance, early draws off and acts the part of disinterested friend. The girl is a good girl with a bad temper; but there is a bad girl with a good temper, who attempts to ensnare David, and is a *causa malorum*. Unluckily, as all readers of an extraordinary book, which Mr. Solly published seven or eight years ago, are aware, the author considers himself to be not merely an authority about working men, but an authority about the relations of the sexes. He even goes so far as to make James Woodford in his introduction pay a special compliment to his friend the editor's polishing up of his work in regard to "all about the women." *James Woodford* does not give quite such remarkable evidences of Mr. Solly's notions about women and men and women as *Gerald and his Friend the Doctor*, but it exhibits him once more as one of the amiable and well-intentioned, but unsavoury, reformers who see all things in social evils.

The subject of the book prevents a very great indulgence in the treatment of this subject; but Mr. Solly has made the most of his opportunities. He has introduced what may, perhaps, be called with an excusable indulgence, in the language of burlesque, a fine old crucified seducer. Mr. Haughton of Oxford (Mr. Solly evidently shares the idea, consecrated by many ages of melodrama, that the Universities are nurseries of vice) makes a fruitless attempt upon Maggie Thatcher, the virtuous heroine; a too successful one upon Kitty Barber, her flighty young rival. The catastrophe of the book itself is of such an exquisite unreasonableness and improbability, that we really think it must have actually occurred. David Roberts, the physical-force Chartist, is but a weak young man. He has been present at the Orange Street headquarters in company with the respectable Mr. Ousley and the patriotic Mr. Fussell. He leaves that focus of conspiracy at a certain time unconscious that a policeman (whom he has offended) and a spy have detected the meeting, and that it is *cerné*. On the way home he meets Kitty Barber at or near the Oythra (the expression is Charles Lamb's, not ours), on Primrose Hill. That young woman is effusive, and prevailing on the weak David to embrace her, suggests that he should escort her to her respectable home. Thereon appears Mephistopheles Haughton and gibes, though David is proof against the last temptation. Meanwhile, the minions of the law have effected the capture of the friends of freedom in Orange Street, and though Roberts is not caught, the policeman swears that he was present at a certain time. He could clear himself by calling Kitty and Haughton to prove an *alibi*; but he will not, because this would excite his wife's suspicions as to his relations with Miss Barber, and would make her unhappy. Result, transportation. Things come right, as it happens, owing to the benevolence of Sir George Grey, who is fortunately alive to be gratified by Mr. Solly's high opinion of him. But the curious piece of perverted knight-errantry by which a working-man prefers to beggar and disgrace his wife and family rather than risk a jealous scene, in which he could clear himself, suggests, either that Mr. David Roberts was a very chivalrous person indeed, or, which is more probable, that he was horribly afraid of his wife, and not sorry that "seas between them braid should roll."

We have said enough of Mr. Solly's book. It is not too late for him even now to take Mr. Seeley's good advice, and to write a sober history of the Chartist movement, especially the curious incidents of its agony in '48, without any James Woodfords or David Robertses, and without any depressions tending to show his accurate knowledge of the peculiarities of the female sex, virtuous and unvirtuous. Such a book would, we repeat, have value; and the persons who, from their own knowledge, could write it are

becoming very few. Mr. Solly's judgment, indeed, and his political grasp are more than dubious. His acceptance of the ingenious theory that "Somerville the soldier" carried the Reform Bill will hardly be endorsed by those who have read Somerville's own book. His remark—put in the month, of course, of Mr. Woodford—that "I've learnt that there were noblemen, baronets, M.P.'s, great merchants, manufacturers, shopkeepers, who were ruined socially or politically, who were sent to prison or into the Gazette, or were driven out of the country because they stood up against the Tory tyrants of the day," shows a very remarkable power of looking at things through coloured spectacles. But apparently he knows the facts of Chartism, and he might tell them. In *James Woodford* he has attempted, not facts, but literature, and has failed.

#### FREEMAN'S HISTORICAL GEOGRAPHY OF EUROPE.\*

HISTORICAL geography is among the subjects which Mr. Freeman has made peculiarly his own. No one has done so much as he in emancipating our minds from what he himself has somewhere called "bondage to the modern map." Even the most unenlightened Philistine, in whose ideas our historian is chiefly connected with an eccentric method of spelling the names of the "Saxon" kings, has also some hazy idea that Mr. Freeman is further characterized by an insuperable repugnance to call Gaul France, or France Gaul. And many doubtless have derived their first clear notion of what historical geography really is from a passage on the subject in Mr. Freeman's first volume of *Historical Essays*. In connexion with the present work we may not inaptly quote Mr. Freeman's own description of the way in which historical geography was ordinarily taught, or rather not taught, about twenty years ago:—"People are set to read the history of the world with two sets of maps. One is to serve from Adam to Theodoric or to Charles the Fifth—we are not quite sure which; the other, from Theodoric or Charles the Fifth to the year 1860. They sit down to read about John and Philip Augustus either with a map of Roman Gaul or with a map of Napoleonic France." (*Historical Essays*, p. 163). It is in great measure owing to the labours of Mr. Freeman himself that we have improved upon this state of things, and that historical maps of some kind or other have come to be considered necessary adjuncts of a history. Still there was ample room remaining for such a work as the present one, which will supply wants which have long been felt. Mr. Freeman is careful to disclaim any attempt to enter into competition "either with such an elaborate collection as that of Spruner-Menke, or even with collections much less elaborate than that"; and he almost regrets that it has been found necessary to bind his maps in a volume by themselves, "because this looks as if they made some pretensions to the character of an historical atlas." From the point of view of practical convenience, however, there can, we think, be no doubt that his publishers have judged rightly; and, indeed, Mr. Freeman here seems to be unnecessarily modest. The maps are not large, their utmost extent being that of a double page of an octavo volume; and they cannot, therefore, do more than, as their author says, "illustrate changes of boundary in a general way." But within their assigned limits they form a complete and elaborate historical atlas, from the days of Homeric Greece to those of the Treaty of Berlin. Like English maps in general, they strike us as somewhat rough and inferior in execution to foreign, or at least to German, work; but this is a matter for which the author is not responsible.

That the text is full of concentrated learning we need hardly say. To speak of Mr. Freeman's wide range of knowledge, his thoroughness, his accuracy, his care for every detail, seems superfluous. We need not repeat how valuable the work will be alike to students and to politicians; but we may say that we trust it may help some people towards a better understanding of Mr. Freeman's previous labours. Those who have once grasped the difference between historical and physical geography, and between political and geographical nomenclature, will also grasp the true meaning of much in Mr. Freeman's works which the ignorant or the superficially educated condemn as pedantic trifling. Even those " quaint little peculiarities of spelling and nomenclature," which, we have lately been told, "mean so much to Mr. Freeman and so little to the rest of the world," may come to be rightly appreciated. To the accurately trained mind some of them at least mean as much as they do to Mr. Freeman.

In his first paragraph the author defines what historical geography is:—

The work which we have now before us is to trace out the extent of territory which the different states and nations of Europe and the neighbouring lands have held at different times in the world's history, to mark the different boundaries which the same country has had, and the different meanings in which the same name has been used. It is of great importance carefully to make these distinctions, because great mistakes as to the facts of history are often caused through men thinking and speaking as if the names of different countries, say for instance England, France, Burgundy, Austria, have always meant exactly the same extent of territory. Historical geography, in this sense, differs from physical geography which regards the natural features of the earth's surface. It differs also from studies like ethnology and comparative philology, which have to do directly with the differences between one nation and another, with their movements from one part of the world to another, and with the relations to be found

\* *The Historical Geography of Europe*. By Edward A. Freeman, D.C.L., LL.D., Honorary Fellow of Trinity College, Oxford. 2 vols. London: Longmans & Co. 1881.

among the languages spoken by them. But, though it is distinct from these studies, it makes much use of them. For the physical geography of a country always has a great effect upon its political history, and the dispersions and movements of different nations are exactly those parts of history which have most to do with fixing the names and the boundaries of different countries at different times.

For eloquence and picturesqueness there is, of course, hardly room or opportunity in a work of this technical kind, and one which, though it cannot be described as a small book, has, by reason of the magnitude of the subject, to be written with the utmost compression. Clearness, decision, precision, are the qualities which we look for and find here. Yet here and there the author is able to rise into eloquence, as in the concluding summary, which, though too long to quote in its entirety, is a good specimen of Mr. Freeman's more ambitious style. The theme is one with which he has made us familiar—the undying power of Rome and of Christianity, “the two influences which, mingling into one, have made Europe all that it has been.”

The whole of European history is embodied in the formula which couples together the “rule of Christ and Caesar”; and that joint rule still goes on, in the shape of moral influence, wherever the tongues and the culture of Europe win new realms for themselves in the continents of the western or in the islands of the southern Ocean.

The chapters relating to our own island are sure to be read with interest, even though the historical geographer has here no large field to work in. Britain “being an island, was secured against the constant fluctuations of its external boundary to which Continental states lie open”; and, at any rate from the eleventh century onwards, there has been singularly little change within it:—

The boundaries of England towards Scotland and Wales changed much less than might have been looked for during ages of such endless warfare. Even the lesser divisions within the English kingdom have been singularly lasting. The land, as a whole, has never been mapped out afresh since the tenth century. While a map of France or Germany in the eleventh century, or even in the eighteenth, is useless for immediate practical objects, a map of England in the days of Domesday practically differs not at all from a map of England now.

But the sections relating to the formation of the kingdom of Scotland—a matter upon which people in general are, in spite of all that has been written on the subject, still very hazy—and that upon the formation of the modern English shires, are of great value and interest, trifling though our small fluctuations of boundaries may appear when compared to the changes in Continental States. We observe that in a note on the Principality of Wales, Mr. Freeman says, “The first English prince, afterwards Edward the Second, was not his father's eldest son at the time of his creation.” This seems a literal acceptance of the famous tradition preserved by Stow. The date usually assigned for the formal creation, and accepted by Canon Stubbs, and by the careful and trustworthy compiler of the *Annals of England*, is 1301, when Edward of Caernarvon had for some years been heir-apparent.

Besides these English sections, the chapters bearing on the Eastern question cannot fail to find students at the present moment. It is, perhaps, unfortunate that the expression of strong partisan views on questions of contemporary politics should be allowed a place in a work intended for students. But to the casual reader there will be some interest in noting the passages in which Mr. Freeman more or less openly reveals his own feelings, as in the attack on the “anachronism” of the Austrian power, or in his implied regret at the disappearance of the name of Sicily from the European map—“The island of Hieron and Roger has sunk to form seven provinces of a prince who has not deigned to take the crown or the title of that illustrious realm.” Then we have the expressive division of Bulgaria into “free,” “half-free,” and “enslaved”; the sneer at “the diplomatic name of *Eastern Roumelia*”—which is “northern Roumelia, according to the compass”—and at “administrative autonomy,” a half-way house, it would seem, between bondage and freedom”; the cry of sorrow over “the old Macedonian land,” where Greek and Bulgarian alike are handed over “to the uncovenanted mercies of the Turk.”

We need not say that the heroism of the Montenegrins and their wrongs at the hands of “Western diplomacy” are prominently set forth. Of three havens won by Montenegro in the war, “Austria has been allowed to filch Spizza, as she had before filched Ragusa and Cattaro”; and, though Antivari has been left to those who had won it, it is “under such restrictions as armed wrong knows how to impose on the weaker power of right.” It is of course impossible to keep pace with the rapid progress of political change in those regions. In the text Mr. Freeman speaks of the first of his three havens, Dulcigno, as “given back to the Turk”; in his final “Additions and Corrections” he has to note its restoration to Montenegro. Of all Christian States Austria is throughout the one which comes in for the hardest treatment at the hands of Mr. Freeman, who has both public and private grievances against her—for any possible deficiencies in his maps of Dalmatia are laid to the charge of “the Imperial, Royal, and Apostolic post-office,” which, it seems, lost or confiscated a set of manuscript maps sent to Mr. Arthur Evans for his suggestions. “If, therefore,” observes Mr. Freeman, “the revolutions of Dalmatian geography are less accurately marked in this book than they should be, the fault is not mine.” On another point—the proper system of spelling Slavonic names—Mr. Freeman seems to have suffered from a multitude of advisers. “I consulted,” he says with grave humour, “several Slavonic scholars. Each gave me advice, and each supported his own advice by argu-

ments which I should have thought unanswerable, if I had not seen the arguments in support of the wholly different advice given me by the others.” We take this quotation from the preface, in which the author admits the reader to his confidence, avowing, what might perhaps have been discovered from internal evidence, that the book is not “the result of one continuous effort,” and that the early part of it was printed some years ago. The completion has been “delayed by a crowd of causes, by a temporary loss of strength, by enforced absence from England, by other occupations and interruptions of various kinds.” It is inevitable that, as a work of art, the book should thereby have sustained some injury. But, for practical purposes, the author's care in supplying additional notes and corrections, and in calling attention to the places where “later lights have led to some changes of view or expression,” render the defect of but little importance. It is impossible not to admire the frankness with which he observes upon one passage, “When I wrote this, I had not taken in the true history of the Rouman people.” In a second edition we shall trust to see these “later lights” incorporated in the text. But altogether this long-promised and long-expected work is worthy of its author, and will be welcomed by all students of history and politics.

#### SPORT AND MILITARY LIFE IN WESTERN INDIA.\*

IT is not very clear why, if this journal was to be published at all, it was not published by the author during his lifetime. He lived in England more than twenty years after his retirement from active service, and must have had plenty of opportunities for recasting and expanding his notes. Yet, if the thing had to be done, we are not disposed to find much fault with Colonel Malleon for the way in which he has done it. Colonel Fraser came of a good Scotch family, of which an account is given in the preface by the editor. There is in one passage some unaccountable muddle in dates, for an ancestor of the subject of the memoir is said to have had a grandson born in 1777, and to have been born himself in 1810. We may charitably suppose that 1710 was intended. The subject of the present memoir is the son of the George Fraser born in 1777. He seems to have been active, healthy, and strong; an ardent sportsman, ready to turn out for the pursuit of any game from the quail and the snipe to the tiger and the bison; and capable of doing good service to the State, not perhaps in high diplomatic situations, but in recruiting, organizing levies, and transporting men and horses for duty in the Crimea. One tiresome feature in the journal is the almost invariable use of asterisks which serve no purpose but to irritate. A moderate acquaintance with the history of events in the Bombay Presidency has enabled us to supply several of the real names of men and places. Colonel W., mentioned in connection with the disturbances in Kolapore and Sawantwarri in 1844-45, is Colonel Wallace. Messrs. R. and W., alluded to very needlessly in a foolish story about *Khutput* at Baroda, are Mr. Lestock Reid and the late Sir J. P. Willoughby. Mr. B., of Khandesh, is Mr. Boyd, the Collector of that district, who afterwards died as Resident at Baroda. M. is evidently intended for the station of Mulligam; and we could multiply instances of what appear to us needless scruples about events that occurred more than a quarter of a century ago.

A great deal of the journal is made up of life in cantonments, stories at mess, exposure to heat and rain, and mishaps to companions and subordinates. This excellent colonel's experiences are occasionally more full of force and significance than of grammar. His education at Harrow, though cut short prematurely, might have taught him that *ferre nature* is not the Latin equivalent for a wild beast, and generally his diction reminds us of one of Thackeray's Henries. But the style is free from humbug and affectation; none of the stories are incredible; and there are some odd revelations about life in cadet's quarters thirty or forty years ago, which remind us either that promising careers were cut short by drink and duelling, or else that men of weak constitutions and weaker principles speedily succumbed to climate and excesses. Some of the anecdotes about the early exploits of Outram confirm the opinion of that gallant officer held by his contemporaries and given in his elaborate biography. But why could they not have been imparted to Sir F. Goldsmid when he was writing Outram's life? His determination to succeed, and refusal to be beaten by any obstacles, his fiery and impetuous but chivalrous and candid nature, are illustrated by one or two anecdotes worth remembering. Colonel Fraser and his companions had toiled all day over rough ground, cut up by ravines and covered with jungle, after a tiger, and had given it up as a bad job. Outram persevered and brought home the animal late in the evening. A companion, who is set down as T., got mauled by a she-bear which he had attempted, in defiance of scriptural warning, to rob of her cubs. The others were afraid to use their guns, but Outram threw himself on the enraged animal and despatched her with a long hunting knife. A favourite *Shikari* of Outram's was terribly injured by a tiger and died the same evening. Outram taxed a brother officer with having caused the catastrophe by neglect of orders and desertion of his post; words rose high, defiance was exchanged, and we were relieved

\* *Records of Sport and Military Life in Western India.* By the late Lieutenant-Colonel T. G. Fraser, 1st Bombay Fusiliers, and on the Staff of the Indian Army. With an Introduction by Colonel G. B. Malleon, C.S.I. London: W. H. Allen & Co. 1881.

to find that the only other victim on the expedition was the tiger itself. In connexion with this event we are informed that female elephants are hardly ever used for this sport in Bombay. Colonel Fraser was astonished at the docility of the Bengali females that had joined his party from the large station of Mhow or Mio as it is now spelt. Females have no tusks, but they use their legs and trunks with telling effect, and their docility and gentleness are on a par with their bravery. One of the best elephants we ever rode, equally able to withstand a roaring tiger or a charging buffalo, was a female, the property of a planter, and seventy years old. As a contrast to a fierce tiger that charged the line repeatedly till he fell dead, we have an odd story of a large and almost inoffensive beast of the same kind, that was slain close to a dung-heap at the back of a hut; the villagers, for some mysterious reason, denying to the last all knowledge of its existence. Readers must be, however, warned against believing that this animal, or any other tiger, ever measured in life twelve feet two inches from the tip of the nose to the end of the tail. The skin, it is well known, stretches after it is taken off by the *chamars*. Captain Baldwin, in his capital account of the Large and Small Game of Bengal, distinctly tells us that he had never seen an "authentic account" of a tiger that "measured more than ten feet and two or three inches." This measurement is confirmed by Dr. Jerdon, who wholly disbelieves in tigers of eleven or twelve feet in length.

A fever caught while snipe shooting in a malarious locality sent our Colonel home at once. After a two years' furlough he returned with a wife. But he prudently does not intrude his domestic affairs on the public; and we are bound to say that, though his married life appears to have been a happy one, his fondness for tents, tigers, and elephants never abated. He shot a panther inside a *pan* garden, which somewhat resembles a bed of raspberry bushes, if they were only covered with matting at the sides and the top. This exploit was by no means unattended with danger. It is significant of the state of public feeling forty years ago that as much space is given to the above incident as to the account of a duel which is told by the survivor of the principals to a party of officers assembled in a bungalow after morning parade. Of course there was a lady in the case; and it is some consolation to know that though the principals and seconds were tried and acquitted by an irreproachable British jury in the old Supreme Court of Bombay, the deceased officer was the offender and did his best to shoot the man whom he had insulted. Still, we are hardly prepared to assent to Colonel Fraser's sweeping maxim that the "abolition" of duelling is a "blunder." Equally belonging to the past is, we should hope, a very rude remark made by an old sea captain to a party of French naval officers on board their own frigate *L'Artemise*. Luckily the meaning of the words and the action was misinterpreted by M. Le Commandant, and we agree with Colonel Fraser in terming the remark a cowardly insult. But this happened before the Crimean war, and the renewed good understanding and time of which the contemporary poet wrote:—

O! battle friends! O! brothers  
Across the chalky strait,  
O! never more between us  
Be spoken word of hate:  
By treaties and fair promise  
The States are now allied;  
But this, the nation's compact,  
At Inkerman was tried!

The author was present at the bombardment and capture of Aden in 1839. This was effected by a frigate and a gun-brig of the Royal navy, aided by a schooner and a sloop of war of the Indian navy. A one-sided account is given in this book of our previous relations with the Sultan of Lahej, who is called the Sultan of Aden, and our Political Agent is represented as getting up a collision with the natives. The truth is, that Captain Haines—for it is absurd to pretend that the letter H. conceals anything—had been instructed to negotiate the purchase of the station. Wrecked crews had been plundered and barbarously treated, and the Sultan had engaged to cede Aden as a coaling depot, receiving an annual payment of 8,700 crowns. While negotiations were still proceeding, the Sultan refused delivery of some plundered property, and actually got up a plot to seize our Agent. After the capture of the place the British Government was inclined to behave most liberally to the Sultan and other chiefs. And to this day, after violations of the agreement and fruitless attempts to retake from us the rock and harbour, considerable sums are still paid annually to the Sultan and to all sorts of chiefs, Foodhees, Abdalees, Akrahees, Hooshabees, and Yafasees. An editor of the ample knowledge and resources of Colonel Malletson should not have allowed the hasty remarks of a sporting colonel to pass without addition and correction. To say the truth, Colonel Fraser's political sagacity hardly seems on a par with his woodsmanship. He makes out that what most statesmen and writers have agreed to call a Sepoy mutiny was nothing else than the rising of a suffering people against oppression and the "writings of a subdued race." A brief and sufficient answer to this random remark is that, if many Hindus and Mohammedans had really risen against us with a clod in each hand in aid of the Sepoys, we should, as a native gentleman long ago remarked to an Indian official, have been left buried under a huge mound of earth. Colonel Fraser showed much more tact and administrative power when, as second in command of the well-known Poonah Horse, he quelled what might have been an ugly mutiny of the troopers. These men complained of the treatment they had experienced in

the first Afghan campaign, and refused to proceed to Aden. But a short speech from the author settled the matter.

The author served in Scinde during the first Sikh campaign, and we can quite confirm his statements as to the feverish expectation aroused in that province, and, indeed, all over India, after the severe actions of Moodki and Ferozshah. There really was a brief time in which it was thought not impossible that old Sir C. Napier, with some 22,000 men, might have had to abandon Scinde and come to the aid of Lord Gough and Lord Hardinge. Happily Soobraon put an end to all doubt on the subject. The climate of Scinde is not a pleasant one, though the author admits that the sea breezes mitigate the heat about Kurachee and Tatta. There are, however, splendid crops in the valley of the Indus, and of late years the rainfall has considerably increased. The author does not appear to have suffered from that distressing malady, the Scinde boils. How Colonel Fraser set a native's fractured leg with splints, and found the patient perfectly well six months afterwards, is a proof of his own aptitude and of the extreme docility of a Hindu or Mussulman under suffering. The famous tank called Maggar Pir—not Maggurpur, as in the text—has been often described. Huge alligators here are considered sacred and come to be fed at the call of Faquirs and others. A woman with a beard, at the same place, the wife of a goatherd, was a novelty, and reminds us of the hairy woman seen in Burmah after our first campaign there, in 1826. But this is nothing to the account of an indigenous lithotomist, who performed his operations successfully with a sixpenny knife and carried the extracted stones about in a bag. We see no reason whatever to doubt the truth of this story, which was confirmed at the time by the medical officer of the station. An American trip pleasantly varies the Indian experiences. The author avoided Delmonico's and took up his quarters at a respectable hotel, where his linen, to his astonishment, was washed, dried, and ironed for him in the space of a couple of hours. He also saw several specimens—favourable and unfavourable—of our American cousins, was tossed about on Lake Erie, and nearly drowned on his return voyage to England. The author only expresses a feeling shared by many Anglo-Indians at the time of the Crimean war when he says that "to us in India the idea of an army sick and starving, within six miles of shipping filled with every kind of supplies, for want of a road, seemed simply incomprehensible." There were several officers, civil and military, who would have been quite prepared to make the communication by importing labour from Constantinople, housing the workmen on board a large ship in Balacava Harbour, and starting from that place every day to lay down the road, for which there was plenty of rough material. But that they were not thought of is no wonder, seeing that Colonel Fraser himself offered to supply any amount of grain and forage from Egypt, and waited three months before he got a stereotyped answer. Indeed, these notices of public events, honestly recorded at the time, are more valuable than stories of man-eating tigers and deer that went several hundred yards with a bullet lodged in the thorax or the heart.

#### NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

#### THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 58 gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

## AYUB KHAN'S VICTORY.

THE battle of Kareez-i-Atta was described by Mr. GLADSTONE as an important engagement as far as the Candahar country was concerned. The description may, perhaps, be best defined as a polemical limitation. Until fuller news is received of the details and results of the battle, it will be impossible exactly to estimate its effect on Afghanistan, on India, and on England. But at present, and so far as the news yet received goes, the case is as follows. AYUB, having already beaten the English, has now beaten the nominee of England who was supported by English money and material of war. At Kareez-i-Atta, as at Maiwand, he has displayed, or his advisers have enabled him to display, capacity and courage of a very high order. The Candahar troops, as was always expected, have deserted to him; and not only this, but a Kelat regiment has followed the example. That is to say, not merely the Durandees, but the great Ghilzai tribe, may be expected to embrace his cause, which in that case must prove successful. The theory of the present Government is that his success or his ill-success matters nothing to us. It is a matter of great importance to the Candahar country, in the neighbourhood of which, as Mr. GLADSTONE proceeded to explain, with some vagueness of geography, there is a large Anglo-Indian force. That force will therefore be able to look on, and the native tribes will behold it looking on, while the conqueror of Maiwand, the unpunished murderer of Lieutenant MACLEAN, the prince to further whose expulsion from Herat our troops handed over Candahar to ABDURRAHMAN, occupies Candahar itself and marches on Cabul. Such, at least, is the probable course of events. At present there is no need to comment any further on it than by saying that the first fruits of the evacuation of Candahar have ripened with remarkable rapidity, and that an abundant crop may be expected.

## ENGLAND AND TURKEY.

MR. COWEN with some reason deprecated, in the interest of MIDHAT PASHA, a prolongation of a debate on the judicial proceedings at Constantinople. The less cautious friends of the prisoners ought to have been satisfied with Mr. GLADSTONE's statement that Lord DUFFERIN had been instructed to use in their favour such influence as he might find it possible to exercise. No diplomatist may be more implicitly trusted in a matter where humanity and tact are equally required. It would be injudicious to inquire, whether the Ministers believe in the innocence of MIDHAT or in the suicide of ABDUL AZIZ. Their interference in any legitimate form was justified by the undoubted fact that the accused persons, whether or not they are guilty, had not a fair trial. The case against them is not strengthened by the later reports of confessions supposed to have been made by some of their number. Those who are suspected of having devised the whole story of the murder for purposes of conspiracy may also be supposed to have forged admissions for which, if they were genuine, there seems to have been no adequate motive. According to one story MIDHAT PASHA after his conviction attempted to open his veins with a pair of scissors, partly because he was weary of life, and chiefly to prove that ABDUL AZIZ might have committed suicide with a similar instrument. The SULTAN is said to have remonstrated

against the hasty proceeding of an alleged criminal whom his judges, possibly at his own instigation, have condemned to death for murder. The whole story may possibly be true; but it has not the advantage of being credible. If the SULTAN was really solicitous for the preservation of MIDHAT's life, members of the House of Commons had no need to trouble themselves about his safety. It was at least possible that they might injure their client by officious interference. It may also have been desirable to remember that Mr. GLADSTONE has formerly made a violent attack on MIDHAT's character, though he may perhaps not believe him to be guilty of murder. The Minister who dethroned a Sultan because he had become abjectly subservient to Russia, and who was chiefly responsible for the subsequent war, was naturally obnoxious to the author of the bag and baggage policy; but Mr. GLADSTONE is incapable of wishing that a political adversary should be unjustly punished as an assassin and regicide.

The SULTAN was said to have been surprised and irritated by the report of the feeling which the late State trial had produced in England; but he seems afterwards to have reconsidered his first impression. He may perhaps have been incapable of understanding the Western prejudice against interference with judges during a trial and against suspected subornation of perjury. According to more than one newspaper correspondent, the public opinion of his own subjects is favourable to the SULTAN. Orthodox Turks, it is said, hold that the dethronement of ABDUL AZIZ, which was undoubtedly effected by MIDHAT and his associates, was a graver crime than the murder of which they are accused. Punishment on a fictitious charge of guilt, incurred by an act which might not furnish a convenient ground of accusation, would perhaps not be repugnant to an Oriental sense of justice. Three hundred years ago English judges were often consulted by the Crown in the earlier stages of a prosecution, though few of them would have consented to receive instructions during the course of a trial. In the present instance the SULTAN was the real as well as the nominal prosecutor, and an acquittal would have been universally regarded as a defeat. Three or four of his most formidable subjects have received a stigma, which will henceforth exclude them from official employment, although heavier punishment is remitted. If any of the humbler prisoners are eventually executed, the SULTAN's severity will probably have been caused by apprehension of personal violence to himself. Notwithstanding many precedents to the contrary in Ottoman history, ABDUL HAMID may, perhaps, hope to create an impression that the person even of a dethroned sovereign is inviolable. After his active and successful efforts to secure a conviction, he can scarcely account for the lenity which has been practised by professing to be satisfied of the innocence of the prisoners. Lord DUFFERIN must have needed all his practised skill to intercede to good purpose for the life of MIDHAT. It would scarcely have been prudent to argue that he has been unjustly condemned, when the verdict was given in deference to the wishes and instructions of the sovereign. It was also impossible to contend that the murder of the SULTAN's kinsman and predecessor was a venial offence. The English Government would not have been justified in interfering except on the ground that the accused may perhaps be innocent; and yet a direct imputation of injustice was calculated to defeat its purpose. The Turks may, perhaps, not insist on the logical dilemma. A European Government would object to pardon a great criminal on the

application of a foreign Power; but the SULTAN has thought it expedient to oblige a Government with which he has complicated relations. The banishment of all the prisoners of high rank indicates either the deference of the SULTAN to the representatives of the English Government, or perhaps his disbelief in the guilt of the accused.

It is uncertain whether Lord DUFFERIN is thus far in a position to confirm Mr. GOSCHEN's statement that the English Government, after all the events of the last five or six years, still possesses greater influence in Turkey than any of its competitors or allies. Perhaps Montenegro and Dulcigno have been forgotten; and indeed a judicious Turkish statesman would recognize the advantage which his country has derived from the application of European pressure. If, nevertheless, the Naval Demonstration has increased the influence of England at Constantinople, the result must be ascribed rather to fear than to love. The services which were rendered by the united Powers to both parties in the Greek controversy may perhaps be more readily appreciated. It was equally for the interest of Greece and of Turkey that the settlement of the frontier should be taken out of the hands of the parties to the dispute, and that it should be settled by self-appointed arbitrators. Gratitude may be due to the collective body of Ambassadors and to the Governments which they represent; but it is not at first sight obvious why England, which inclined throughout to favour the Greek claims, should be preferred to France, which had suddenly abandoned the Greek cause, or to Germany, which took the lead in the negotiations. Since that time the French Government has wantonly assumed an attitude of hostility to Turkey; and it is supposed that a special Envoy has been despatched from St. Petersburg to Paris to arrange joint action between France and Russia. It is understood that the relations of Germany and Austria with the SULTAN are at present friendly.

Mr. GLADSTONE has stated in the House of Commons that Lord DUFFERIN's earliest duty will be to promote the long-promised and long-delayed improvements in the administration of Armenia. In this enterprise the European Concert will be of no avail. The English Ambassador will be compelled to rely on arguments which may not be so practically effective as they will be logically conclusive. It is difficult to understand how the most persuasive of diplomatists can produce a conviction which the state of affairs has not long since suggested. In the greater part of Armenia and Asia Minor there is no adequate security for life and property; and in some districts the peaceable inhabitants are exposed without defence to the violence of marauders. Almost all the predatory tribes are Mahometan, though many of their victims belong to the same religion. Notwithstanding a long succession of disasters caused by misgovernment, corrupt Ministers at Constantinople are still in league with local Governors, who plunder their provinces for the benefit of themselves and their patrons. It cannot be asserted that foreign emissaries have lately been especially busy in Armenia; but civil and military officials seem to be occupied in preparing the way for their intrigues. It is satisfactory to know that in all parts of the country the oppressed classes have long regarded the English consular agents as their protectors, or, in the absence of power to aid them, as their zealous advocates. It would seem that the correction of the prevailing anarchy is not impossible, as the Government and its subjects have a common interest in the general prosperity; but the long delay of promised improvement has not been caused by failure of remonstrance. Lord DUFFERIN, like his predecessors, will encounter the difficulty of providing a fulcrum for his diplomatic lever. He will have no European concert at his back; nor can he point, as in the case of Greece, to an army prepared to invade Turkish territory. If Mr. GLADSTONE and Lord GRANVILLE can succeed as well in Armenia as in Greece, they will have attained a great political triumph.

#### THE LIVERPOOL MESSAGE OF PEACE.

THE peculiar vivacity with which Mr. GLADSTONE last week rebuked Sir STAFFORD NORTHCOTE's reference to the dubious effect of messages of peace to Ireland may possibly have been quickened by the knowledge of the return message which was then lying at Liverpool. It is part of the PRIME MINISTER's idiosyncrasy to be never so confident in his own theories as when something has happened to

discredit and disturb them. The devoted supporters of the Government have, however, been a little troubled by the Liverpool discovery. It does not interfere with their general principle as to Irish affairs, which is, that when Ireland is tranquil it is a proof of the efficacy of messages of peace, and that, when it is disturbed, it is a proof of the necessity of more such messages. But it is, from their point of view, still an incident which has its inconveniences. It shows how impossible it is to reconcile the irreconcilable, and it is a very curious comment on the policy of conciliation. That policy has now been pursued unceasingly for more than half a century, and the result is that Irishmen both at home and abroad are more bitterly prejudiced against England and English government than they were on the very morrow of the Byken Treaty and under the severest pressure of the penal laws. The exiled Irishman of the type of SANSFIELD produced by one method of government, and the exiled Irishman of the type of O'DONOVAN ROSSA produced by another, make a very curious parallel study, and would supply a remarkable subject for that series of imaginary conversations dealing with the last half of the nineteenth century which some one may some day be inspired to write.

The hypothesis of a hoax of some kind or other has, as a matter of course, been once more set up. Such hypotheses are in their nature safe from refutation. The probabilities, however, are in this case entirely against the idea. For the purpose of a hoax, or for the purposes of an advertisement, one infernal machine would have answered as well as a dozen. The things are expensive, troublesome, and dangerous to make and to export, and the unnecessary number would greatly increase the expense, the trouble, and the danger, while the chance of detection would certainly not be diminished. The assertions or denials of O'DONOVAN ROSSA and his friends are of next to no value in the matter. But when direct incitements to an act have been published for weeks in American papers, and when the act itself is subsequently committed, it seems a superfluous effort of ingenuity to cast about for any other explanation than the obvious and natural one. "Dynamite" for England, "dynamite as a science," "a little dynamite heroically applied," "give me the sword and dynamite," "dynamite will free Ireland"—these, and a hundred such propositions in prose and verse have flooded the Irish-American prints for weeks and months. Even if the dynamite hypothesis in the matter of the *Doterel* be an invention, it was an invention certain to raise the spirits and encourage the hopes of those who were scoundrels enough to contemplate such a method of irregular warfare. To enlarge upon the particular heinousness of this scoundrelism is, of course, perfectly superfluous. It has been argued with amusing seriousness that the senders of these messages of peace were after all not such bad men as to contemplate the possible destruction of the *Malta* and the *Bavarian*, seeing that they packed their clocks very carefully indeed. The only inference from this is that the machines were pretty certainly not manufactured with any purpose like THOMASSEN's. Whoever sent them naturally desired that they should not go off before doing their work. But that the careful packing of the clocks came from a moral scruple or a sentimental tenderness for the passengers of the *Bavarian* or the *Malta* is a charitable supposition which need hardly be considered seriously, however seriously it may have been put forward. The fact remains that the crews and passengers of these two steamers had as narrow an escape of a sudden dismissal from this world as usually falls to the lot of any one, and a much narrower one than most people would care for.

There seems to be no good reason for finding fault with the secretiveness of the authorities as to the matter. There are cases, of course, where publicity has the advantage of engaging the public on the side of the law and of their own safety. But the public has absolutely no means of controlling the shipments on board vessels which cross the Atlantic, and the only chance of detecting the criminals concerned may have been reasonably thought to lie in silence and in the institution of what, in the police-slang of the *ancien régime*, used to be called a "mouse-trap." The consignees of the infernal machines in this case did not choose to play the part of mice, and it is very probable that they received early warning that their schemes were detected. Indeed, considering the number of fanciful hypotheses which have been started in reference to the subject, it is rather surprising that

some one has not suggested the probability of the matter having leaked out through the agency of the guilty parties themselves. Having missed their chance of an explosion they would thus secure the certainty of an advertisement, while they could not put the authorities more on the alert than they were already. Sir WILLIAM HARCOURT's statement was only open to the charge, not of exaggerating the gravity of the situation, but of somewhat exaggerating the tone in which it should have been treated. Like many other persons who have accustomed themselves to the lighter style, the present HOME SECRETARY is not invariably happy when he attempts the graver. His main position, however, that great part of these crimes are due to the culpable laxity which is permitted across the Atlantic to the Irish press is incontestable. Whatever difference of opinion there may be as to the line which separates undue restrictions on the liberty of the press from restrictions which are absolutely necessary to ordinary good government, there can be no doubt whatever that that line has been overstepped in the case of the Irish newspapers already alluded to. It is a simple fact that the language which, under the benevolent operation of English law, brought MOST into trouble was mild and vague compared to that which these organs of murder and outrage spread among the most excitable, the most ignorant, and the most unreasoning population in the world. The assurances of American papers that no respectable person reads the lucubrations of Mr. O'DONOVAN ROSSA and his friends is not particularly comforting, because it is not from respectable persons that any danger need be apprehended. This last outrage, however, seems to have disturbed the equanimity even of the American press; and almost all the more prominent organs have expressed, not merely their regret, but their opinion that something should be done. It would be somewhat unwise to count much on that something. Political considerations of the party kind, as well as the general theory of government prevailing in the country, will probably prevent Congress from doing anything very definite to discourage or silence the poets and orators of the *Sunday Democrat* and the *Irish World*. It would, however, be rather a bad day with England if she depended on the complaisance of the United States to save her "compact, inflammable cities" from dynamite and petroleum. The protection must come from ourselves, with such due assistance as by international comity the police and public officers of one nation usually lend to each other. The elaborate Customs system which has made smuggling a thing of the past must have lost much of its efficiency if it is not able to provide a fair measure of protection. Nor is there any reason to believe that, unless great mismanagement on the part of the authorities discourages friends, the same means of information which were effectual in this case would be effectual in others. Associations of scoundrels, and particularly of Irish scoundrels, always include faint-hearted or venal persons who, if they know that there is something to be certainly gained by turning informers, will inform. There is another thing which should by no means be forgotten, though in the present temper of too many politicians it is but too likely to be—the absurd lenity which has often been shown to criminals of O'DONOVAN ROSSA's type of late years is a positive bribe to the perpetration of the crimes. While these men pursue their machinations in Ireland, they have the chance of a seat in Parliament; when they are caught they are sure of a merely nominal punishment, of wide popularity and sympathy, and of the notoriety which is perhaps dearest of all to them. When they are released they can go to America, and, besides turning an honest or dishonest penny by aid of their past acts, can carry on the war, as they themselves phrase it, with entire impunity in the future. There are certain enemies of man who, when caught, should always be crushed, and at least one kind of Irish treason-felon is eminently of this class.

#### THE TRANSVAAL.

THE division on Sir MICHAEL HICKS-BEACH's motion had little or nothing to do with the merits of the Transvaal controversy. It was well known that the Government had a steady majority of more than a hundred; and a majority, if it is good for anything, may be relied upon to reject a vote of censure. Mr. GLADSTONE, though he may have had no such intention,

facilitated the discharge of their duty by his faithful followers when he postponed the discussion until the first impression of annoyance had with lapse of time become fainter, and when he pressed it on before the result of the pending negotiations was known. It was hardly worth his while to deny that he had insisted on Sir MICHAEL HICKS-BEACH proceeding with the motion. He had offered him the alternative of making room for Mr. RATHBONE or Sir WILFRID LAWSON to initiate the debate in more favourable circumstances. It was probably right that the Opposition should give expression to the general feeling of dissatisfaction and shame; but a vote of censure which is certain to be rejected has little practical importance. It is admitted on all hands that the decision of the Government is irrevocable, though it may, perhaps, prove not to be final. The Boers will retain all that has been conceded to their demands; and perhaps they will insist, not without effect, on obtaining something more. Mr. GLADSTONE's statement that the English Government is to retain a veto on legislation affecting the native inhabitants of the Transvaal has excited some surprise. No equally definite declaration to the same purport is contained in Lord KIMBERLEY's instructions; and it is more than doubtful whether the Boers will consent to so serious a restriction of their independence. The announcement that, for the purposes of the Convention, natives living beyond the border of the Transvaal are to be regarded as foreigners is not less remarkable. It had been supposed that the reservation to the English Government of foreign affairs related only to European or civilized States. It has never been customary to extend diplomatic recognition to communities which had not a regularly organized Government. Control over intercourse with neighbouring tribes will, even if it is conceded by the Boers, involve a responsibility which ought not to be undertaken without due consideration. If the Republic of the Transvaal is to be prohibited from making war on the Swazies or Zulus without the permission of the Suzerain, a corresponding claim to the maintenance of peace among the natives by English authority could scarcely be rejected. It will perhaps be necessary for Mr. GLADSTONE hereafter to explain, with characteristic facility, that a veto accorded to the Crown on domestic legislation and an exclusive supervision of external relations means that both matters should be remitted to the absolute discretion of the Boers.

The debate practically reduced itself to a single issue. Mr. GLADSTONE and Mr. CHAMBERLAIN maintained that the offer of terms of peace was made before the series of defeats; and it appears that Lord KIMBERLEY's despatch to Mr. BRAND was forwarded on the day before the first of Sir G. COLLEY's disasters. By that document the Government held out the hope of a satisfactory settlement of the dispute if the Boers desisted from armed opposition. The armistice which preceded the peace was concluded when the English force had been thrice repulsed with a loss of more than seven hundred men killed and wounded. The withdrawal of armed opposition was on the other side. Sir EVELYN WOOD, in spite of his remonstrances, was ordered to agree to terms of which one was that the QUEEN's troops stationed in her undisputed territory should not advance to the pass of Lang's Nek, which is also in the colony of Natal. A more humiliating arrangement has seldom been concluded even after a serious defeat; and the possible consequences of the surrender are not yet approximately known. The same settlement would, if, according to Sir EVELYN WOOD's advice, it had followed a successful advance of his troops, have had an entirely different significance and result. The attempts of the Government and its apologists to reconcile the successive phases of the Ministerial policy were wholly abortive. The rebellion had begun, and the armed Boers already occupied Lang's Nek, when the Ministers declared that the suppression of resistance must precede the concessions which might be afterwards offered; and Sir F. ROBERTS was despatched to the seat of war with large reinforcements, which could have no other object than to compel submission. The blunders of Sir G. COLLEY's strategy were his own; but in prosecuting military operations he was strictly obeying his orders. Mr. GLADSTONE and his colleagues, while they were still engaged in suppressing the revolt by force, well knew that peace might at any moment be obtained by the concession of the demands of the Boer leaders. Mr. CHAMBERLAIN, not having yet attained Mr. GLADSTONE's skill in harmonizing contradictions, seemed to admit that the Government had com-

mitted errors, though it afterwards recognized, and as far as possible applied a remedy to the results.

It was natural that the debate should be in some degree retrospective; but, on the merits of the policy which had preceded the Transvaal revolt, there is no real difference of opinion. The annexation, even if it were justifiable as regarded the Boers, was the grossest of blunders. If the measure were expedient, it might have been adopted within a short time on the application of the very community which has since denounced it as usurpation. Another grievous mistake was the unprovoked attack on the Zulus, with the result of relieving the Boers of the Transvaal from all apprehension of invasion and from need of a protectorate. The policy of the late Government is nevertheless not well adapted to purposes of reclamation. Lord KIMBERLEY at the time agreed with Lord CARNARVON; Mr. KNATCHBULL-HUGESSEN, who had been Under Secretary of the Colonies in the Liberal Government, without protest from his superiors cordially approved of the measure; Mr. GLADSTONE himself was silent, and there is no reason to suppose that he at that time differed from his colleagues. It is probable, though the truth cannot be positively ascertained, that Mr. GLADSTONE'S Midlothian speeches were among the causes of the Transvaal rebellion. When he afterwards announced that the annexation was irrevocable, the malcontent Boers had abundant cause for disappointment. It is not improbable that his latest speech will tend to revive irritation. When he asserted two or three weeks ago that the independence now conceded was equivalent to the local self-government which had been formerly promised, it might be supposed that he was, after his usual fashion, playing with words for the purpose of establishing an imaginary or fictitious consistency. The declaration that the English Government is to retain a veto on legislation for the natives will produce a more serious impression. The Boers may, perhaps, not pause to consider that such a power, if it were nominally established, could not be practically exercised. A veto on the part of an English Resident, who would have no military force at his back, would be summarily and safely disregarded.

The fragments of news which are forwarded from the Transvaal are much more interesting than the foregone conclusions of the majority of the House of Commons. All Englishmen, with the exception of unscrupulous partisans, wish that the negotiations should result in an equitable and lasting arrangement. Judicious politicians, though they must regret the manner in which peace was concluded, are not disposed to render it precarious by imposing on the Boers unpalatable conditions. They would, for similar reasons, gladly recognize an honourable and conciliatory disposition on the part of the representatives of the Transvaal. It cannot be said that the latest reports are in any way reassuring. It appears that the Commissioners have, for good reasons, objected to an addition which the Boer delegates have lately made to their number. The person with whom the Commissioners refuse to hold intercourse was concerned in the treacherous occupation of Potchefstroom, and he is accused of having treated the garrison and inhabitants with insolence and cruelty. It is added that the Boers have refused their assent to several articles of the draft Convention. The acquittal by a jury of Boers of the men who were accused of the murder of Captain ELLIOT is still more disquieting. The crime was in the highest degree atrocious, and there can be little doubt that the Boer leaders had sufficient reasons for charging the prisoners with the guilt. It will be remembered that Captain ELLIOT and another officer were taken by an escort of Boers to the bank of a river which they had no means of crossing except by swimming. They were then set at liberty, but the escort fired upon them as they swam, and Captain ELLIOT was killed. It would be unjust to suspect the sincerity of the Boer delegates who professed to regret the crime; but there is too much reason to believe that the verdict of the jury indicates a feeling of hostility to the English. If the negotiations after all fail, it is difficult to anticipate the consequences. There is still an English army within reach, but the present Government will be loth to employ force; nor, indeed, would the objects of a renewed war be definite or intelligible. It will be impossible wholly to abandon the defence of the claims of loyal residents, although Liberal journalists, with questionable taste and feeling, habitually denounce them as unscrupulous adventurers. The natives will in any event have to take care of themselves. In abdicating its

sovereignty, the English Government virtually renounced the right or possibility of protecting those who had for a short time been its subjects. As Bishop COLLENSO says, the natives, if they have reason to complain, will probably migrate into the neighbouring English colony.

#### THE SHETLAND WRECKS.

ABOUT a calamity such as that which has befallen the Shetland Isles there is, after all, very little to be said. When kings and princes fall victims to crime or accident the minutest details of what has happened are known and recorded. The sufferers are watched by observant eyes down to the very moment of the disaster, and among the survivors are sure to be some who have taken note of every particular in the great man's bearing under the trial. It is not so when the victims are obscure fishermen, little skilled in the observation either of themselves or of others. We can faintly picture to ourselves the fine fishing weather of Wednesday week—weather which sent every available boat to sea, and promised to bring them back with heavy takes and full purses; the clouds that gathered as the night drew on, to burst with a suddenness which left the crews with their boats now far out at sea and their nets and lines set; and the dread with which the wives and children of the fishermen watched the waves from daybreak on the Thursday, a dread which only went on increasing as the hours during which return was possible passed too quickly away. But beyond these generalities of misfortune there is nothing to be known. The lost boats will yield no survivors, and the seas of Shetland are loth to give up their dead. Nowhere is the break-up of family life so sudden and so unrelieved as in the wrecks of these northern waters. In a thousand different ways women may be widowed, children left orphans, and parents deprived of the sons who are their only support. But usually the dead are brought back and there is a little interval of silence and mourning, which serves to divide the life which the survivors have led hitherto from the life which they must lead for the future. The families of these lost fishermen know no such pause. Their dead are doubly lost to them, since they are not even recovered for last looks and reverent burial. It is only their failure to return when others return that establishes the fact that they have died.

But if imagination refuses to reproduce in its fulness the disaster which has just swept away some seventy Shetlanders, it may at least bring before us to some purpose the condition of those who were dependent on them. In Shetland, we are told, it is customary for the men of whole families to fish together in the same boat. In a single crew there will be father and sons, uncles and cousins. Consequently the wreck of a boat may mean the loss of all the protectors to whom a woman and her children had to look. Her husband has gone, and with him have gone sons and brothers and more distant relations still. In islands where fishing is almost the only industry women and children can do but little to support themselves. They live indirectly by the boats, as the men live by them directly. Now that boats and crews are alike gone, they have nothing to look to but the charity of their neighbours. But in the Shetlands there is little or none of that abundance out of which charity springs most easily, if not most willingly. Where all are poor in their degree, contributions must be small and the payments spread over a considerable time. In the present case, however, the need is great and immediate. Some three hundred people have been left destitute in a night. They have to be maintained for the moment and to be cared for hereafter. There is no fear that the Shetlanders will not do their utmost, but even their utmost will not go very far. In some ways, strange as it may seem, we are more separated from these islanders of our own coast than from the sufferers under similar disasters in foreign countries. For the most part we are not helped to realize what has happened by local knowledge, and, in the absence of local knowledge, it needs an unusual effort to bring the disaster home to us. If we had heard of the loss of sixty or seventy men on some coast with which we were familiar, which we had visited in holidays or coasting along in yachts, the impression made on us would be vivid and persistent. The contrast between our own past pleasure and the present misery of the survivors would

recur to us again and again. When the scene is the Shetland Islands we are apt to forget how near to us it is in point of distance, how close to us in point of relationship. In theory they are our fellow-countrymen, and consequently have a paramount claim on our generosity. In fact, they are more strange to us by a great deal than if they were so many Frenchmen or Italians.

It is this that seems to make it expedient to say something more in the way of suggesting contributions than is ordinarily needful. The first mention of a disaster of this kind in the newspapers commonly brings offers of money from all sides. In such circumstances as these the only advice that has to be given is not to allow the customary objects of charity to be forgotten in the more showy and interesting pensioners who have suddenly been thrown upon our hands. Liberality suggested by excitement of this kind is apt to be a little impulsive. It forgets that if A. withdraws his help from B. in order to be generous to C., it is B., not A., that is the real benefactor. There are no signs that any such caution is required now. On the contrary, there is some reason to fear that, unless people are reminded that these islands, so remote from us and yet so closely connected with us, contain many families made destitute by an overwhelming and unforeseen disaster, they will not think of the one way in which it can be of any avail that they should think of it. Already, as we learn from the letter sent to the *Times* on Thursday last by the Accountant-General of the Navy, a small Committee has been formed in London, and will act in concert with the Committee established at Lerwick. This Committee will know, what we in London cannot know, the nature, the extent, and the duration of the destitution so suddenly created, and the most appropriate means of effectually and permanently relieving it. Their only difficulty will be to find the money with which it is to be relieved, and that is precisely the difficulty which can at once be removed by a prompt and judicious exercise of English liberality.

#### TUNIS AND TRIPOLI.

THE criticisms passed by the Duke DE BROGLIE in the French Senate on the African policy of M. BARTHÉLEMY ST.-HILAIRE were couched in serious and dignified language, and were searching and impressive. The Duke knew he had a strong case, and made the most of it. But it was not so much the case of a political adversary as the case of a diplomatist and ex-Foreign Minister. The speaker knew thoroughly the past history of French diplomacy, and could signalize precisely where M. ST.-HILAIRE had made a new departure and point out its probable consequences. The independence of Tunis, in the sense that Tunis is not, and has not been for nearly two hundred years, a part of the Ottoman Empire, is quite as much a part of the diplomatic creed of the Duke DE BROGLIE as it can be a part of that of M. ST.-HILAIRE. It was the Duke, indeed, who, as Ambassador to England, had to submit to Lord GRANVILLE, in 1871, the strong protest of M. THIERS against the effort then made by the Porte to get its sovereignty over Tunis recognized. Nor did the Duke in any way deny that Tunis needs to be watched in the interests of Algeria, or that occasions might arise when it would not only be permissible, but necessary, that pressure shall be put on Tunis to prevent it becoming a focus of disaffection among the Algerian Arabs. What he insisted on was that it had always been the object of France to have an independent Tunis on which it could put pressure, but the existence of which it would uphold. The very reason why an independent Tunis was valuable to France was that it prevented France coming into direct contact with Turkey. Not to have Turkey for a neighbour, not to have constant quarrels, or occasions of discussion with a Power which is in such a position that the slightest quarrel with it may light up an European war, was the permanent aim of French statesmen of every party, and under every form of Government. From this policy M. ST.-HILAIRE seems to every one but himself to have openly and wantonly departed. He has destroyed the independence of Tunis; he has made France the neighbour of Turkey; he has gone to the verge of a quarrel with the Porte; he has forced England to appear on the scene, and to say what it will or will not tolerate. A French speaker naturally added that it was humiliating to France that it should have had to seek the

countenance and favour of the only Power which is interested in seeing it waste its strength in African expeditions, and that the clause of the Constitution which forbids war to be made without the sanction of Parliament was rendered nugatory if the Government might, on its own authority, bombard the forts and kill the subjects of a foreign sovereign.

To all this M. ST.-HILAIRE made the astonishing answer that he was thoroughly at one with the Duke DE BROGLIE as to the importance of having an independent Tunis, of avoiding contact with Turkey, and of sedulously avoiding the complications, to which any attack on a province of Turkey would give rise. He did, indeed, give up the Kroumirs. Those slippery people had not been conquered because they could not be found. Even if they had been found, they needed not an army, but a few gendarmes, to suppress them. But M. ST.-HILAIRE sticks to his independent BEY. Nothing has been done to diminish the BEY's independence or to bring France in contact with Turkey. It was all very well for an outsider like the Duke DE BROGLIE to talk of the BEY's forts having been bombarded, of points on the coast in the immediate vicinity of Tripoli having been seized, of a treaty having been extorted from the BEY. These proceedings might seem odd to an uninstructed critic, but that was only because he was uninstructed. It is only those who are blessed with the inner vision given by access to the Foreign Office who can see these things in their true light. People like the Duke DE BROGLIE must learn to be patient, and then they too will have a power of right perception bestowed on them. All that is taking place now is part of a process. France is working by very subtle means, but its method is very safe and very sure. It is engaged in the delicate task of making the BEY independent, and it has to use the means which it finds at its disposal, although they may not at first sight seem exactly such as it would be natural to use. M. ST.-HILAIRE is as confident as ever that the day will come when all the world will see that, by having his forts occupied, his towns destroyed, his subjects driven into insurrection, a French Consul made his Chief Minister, and by being himself shut up in his palace under a guard of French soldiers, the BEY has been put on the high road to independence, dignity, and uncontested sovereignty. The BEY was, in the eyes of M. ST.-HILAIRE, a drowning man. M. ST.-HILAIRE has plunged into the stream and is saving him; but, of course, he has to seize the drowning man's hair in a rough and rather unpleasant manner in order to bring him to shore.

It is probable that M. ST.-HILAIRE wishes so very much to believe what he says that he really does believe it. He longs to persuade others as well as himself that he has done nothing more than take indispensable steps to prevent Tunis being hostile to France. He is possessed by an unfeigned horror at the possible consequences of what he has done. Above all, he recoils from anything like an attack on Tripoli. No one, he emphatically declared in the Senate, but an enemy of France could suggest that France should provoke the enormous dangers which an attack on Tripoli would involve. To Lord GRANVILLE he has been equally explicit. Englishmen will read with keen satisfaction the extremely plain language which Lord GRANVILLE has used on this point. England will not allow its position in Egypt to be in any way, however indirectly, to be menaced. It will not have the French in Tripoli as the neighbours of the country it protects. M. ST.-HILAIRE says, and says truly, that it could do no good to France to occupy a barren coast lying a desert that stretches over seventeen degrees of longitude. That is a very sensible way of regarding the matter, but it is not exactly the English way. A French occupation of Tripoli might do no good to France, but it might do much harm to England. Therefore it must not be if England can prevent it; and Lord GRANVILLE has rightly judged that the surest way of preventing it is to make it clearly known before any design of the sort is seriously contemplated that England would rather go to war than suffer it to be carried out. M. ST.-HILAIRE has shown both tact and good sense in his manner of meeting this declaration on the part of England. He takes no offence, he gives no half answer, he does not seek refuge in a conditional promise. He recognizes the right of England to retain its position in Egypt unchallenged; he states absolutely that France will keep its hands off Tripoli; he undertakes that, if France has to take measures against agitation fomented in Tripoli, it will remain wholly on the defensive. Lord GRANVILLE could not

but be satisfied with these solemn assurances: A positive and indisputable engagement has been made, and there is an end of the matter satisfactory to England, and as M. ST.-HILAIRE thinks, equally satisfactory to France. If no one else had to be thought of, the matter might have ended there. But it was obvious that this engagement might be only too satisfactory to Turkey. The Turks are accustomed to be protected, but they are equally accustomed to think that they are indispensable to their protectors, and may do what they please under the shelter which good fortune has provided for them. It was necessary, therefore, to warn the Porte that England does not mean that, if Tripoli is used as a centre of agitation against the French in Tunis, England will intervene to shield Turkey from the consequences she would have justly deserved. The day may come when very grave questions may arise between France and Turkey in regard to Tripoli. But for the present the discussion in the French Senate and the action taken by England have very much lessened the probability of any European complication arising out of the Tunis expedition. The very difficulties, too, which the French have now to encounter in Tunis will make them less exposed to any harm that the Arabs of Tripoli, whether instigated by the SULTAN or not, can do to them. The French have to conquer Tunis. They have to deal with an insurrection so serious that the insurgents now show themselves just outside the capital, and hold every inch of ground on which a French soldier is not treading. At the cost of much money and many lives, France will put down this insurrection; but it will have to take measures so strong, so effectual, and on so large a scale, and the Arabs will have suffered so severely, that the enfeebled and disheartened remnant of the subjects of this independent BEY will not for a long time be ready to listen to the voices of the agitators of Tripoli.

#### MR. GOSCHEN AND THE LIBERAL PARTY.

THE City Liberal Club and its guests, while they bestowed merited applause on Mr. GOSCHEN, may perhaps have felt a nervous apprehension lest there should be a disclosure of the differences which in some degree separate him from the leaders and the bulk of the party; but when all persons concerned are equally anxious to avoid an unpleasant topic, reticence is easily secured. If Lord GRANVILLE had been able to take the chair, the avoidance of dangerous subjects would have only required a moderate exercise of his habitual tact. Sir JOHN LUBBOCK is also a judicious speaker, and he is not a violent partisan. Mr. GOSCHEN himself was equal to the occasion. From the beginning of his speech to the end he scarcely referred to the political doctrines which the Liberal Club was established to support. The misfortunes and dangers of the Turkish Empire, which are but accidentally connected with party politics, furnished ample material for an interesting speech. Although much has been said of the peremptory character of Mr. GOSCHEN's diplomacy at Constantinople, he had evidently sympathized with the troubles which he had endeavoured to alleviate; and he even showed appreciation of the military spirit which, among the Turks, seems to be independent of political aptitude. In the harshest threats and remonstrances which it was his duty to address to the SULTAN and his Ministers, Mr. GOSCHEN personally felt that he was performing a friendly service to a Government surrounded by perils. As he said, the urgency of the Montenegrin and Greek questions consisted in the fact that obstinate resistance might not improbably have caused the dissolution of the Empire. Some recent events seem to indicate a discovery on the part of the Ottoman Government that its ancient ally is still its best and wisest friend. That the opposite opinion long prevailed was more the fault of Mr. GLADSTONE than of the SULTAN or his advisers. They may naturally have been excited by the animosity to their race and religion, caused by political and ecclesiastical motives, which Mr. GLADSTONE had repeatedly expressed in unmeasured language. Few other statesmen have thought it justifiable to profess themselves the enemies of any Power with which it may be their duty to maintain amicable relations.

Neither Mr. GOSCHEN nor the City Liberal Club can have forgotten that, only the day before, he had voted with the minority in the most important division which has taken place during the long discussion of the Irish Land Bill. There is no doubt that the Government would have been

defeated if Liberal members in general had ventured to act with equal independence. On no previous occasion has Mr. GLADSTONE been so little able to answer the arguments of his opponents; nor has he been compelled to approach so nearly to the communistic doctrine which would repudiate freedom of contract. His supporters are perhaps not to be blamed for preferring their party and their leader to their opinions, for a defeat of the Government might have produced serious complications; but the avowed secession of twenty Liberal members, and the significant absence of a much larger number, prove that the former doctrines of the party have not been unanimously renounced. Mr. GOSCHEN's speech at Ripon, and his subsequent vote, designate him as the future leader of those Liberals who still adhere to the principles of political economy. He has already been threatened by the organs of the intolerant faction which has usurped the name of Liberal. While Mr. GOSCHEN acquiesces in the flagrant anomalies embodied in the Irish Land Bill, he is not prepared to extend the practice of legislative interference with private affairs. His scruples will not have been removed by the language which Mr. GLADSTONE used on the day of the City dinner. An expression of sympathy with Mr. PARNELL's proposal for the punishment of absentees was the more remarkable at the time when Mr. PARNELL's lieutenants in Ireland publicly declare their purpose of abolishing landlords altogether. In the same speech Mr. GLADSTONE remarked that the moment was not convenient for the discussion of Home Rule, which is therefore admitted to be in some sense an open question. Sir W. HARCOURT may perhaps not have been too enthusiastic in his praise of Mr. GLADSTONE's abounding energy, but in the later stages of the Bill his language has become more and more revolutionary.

In differing on some vital points from the official doctrines of his party Mr. GOSCHEN may claim the credit of sincerity and consistency. It is certain that he is, as far as his convictions will allow, a loyal adherent of Mr. GLADSTONE; but his political temperament indisposes him to a policy of sentiment and impulse. It was on this ground that he declined to concur in the sudden conversion to universal household suffrage which Lord HARTINGTON, in an unhappy moment, imposed on the party. Other opponents to the change in the county franchise have objected to an unnecessary and dangerous increase of democratic power. Mr. GOSCHEN took alarm at the well-known indifference of the working classes to sound principles of political economy. He knows that the maintenance of Free-trade and of freedom of contract depends on the influence of the educated and intelligent classes, and he foresees that the unqualified supremacy of artisans and labourers will encourage a system of legislative meddling for the supposed benefit of the only section of the community which will be practically represented in Parliament. In the same spirit Mr. GOSCHEN protested at Ripon against the application of the principles of the Irish Land Bill to England and Scotland, and he has since voted for the proposal that even in Ireland substantial tenant-farmers should be left to take care of themselves. It may be added that, in confining his remarks to the affairs of Turkey, Mr. GOSCHEN intelligibly hinted that he had nothing to say about English politics which would have been acceptable to the City Liberal Club. The company present probably concurred in the hope expressed by Sir JOHN LUBBOCK that Mr. GOSCHEN might again become member for the City of London. He would, perhaps, be well content to represent his present constituency, but it is impossible to know whether he will be able to secure his return for the electoral division in which Ripon may soon be merged. The City of London never chose a fitter member than a scholar and an able economic writer, who had at an early age established a reputation as a man of business before he abandoned commerce for the occupation of a statesman. Unluckily large constituencies almost necessarily adhere to one or other of the great parties; and the suspicion and dislike with which the Liberals were regarded affected even the ablest and most independent of their leaders. In the last Parliament Mr. GOSCHEN came in at the bottom of the poll, and in 1880 he judged that it would be useless to offer himself as a candidate. He may perhaps, nevertheless, not agree with Mr. GLADSTONE that the wealth of the City deprives its electorate of all claim to respect, as, indeed, Westminster is similarly disqualified by the high social position of some of its inhabitants.

While some of the speakers at the dinner expatiated on the merits of the best of all possible Governments, and on the felicity of the country under its rule, Mr. GOSCHEN, perhaps unconsciously, consoled less sanguine politicians by the description of a community which is in a much worse condition; yet even the remark of an intelligent Pasha, that Turkey had within itself twenty Irelands, may have suggested the reflection that one Ireland is bad enough. As Mr. GOSCHEN said, the SULTAN had lately at one end of his dominions an Albanian League which threatened to assert its independence by arms; and it was necessary to send an army under DERVISH PASHA to reduce the insurgents to obedience. At the same time a Kurdish chief invaded Persia on his own account; and, if he had not been defeated, he might, perhaps, like similar adventurers in former times, have established a new Oriental dynasty. The unhappy SULTAN was, in a sense, responsible for the misdeeds of a vassal who was at the same time rebelling against himself; and, as one of Mr. GOSCHEN's informants truly observed, OBEIDULLAH KHAN is not a person whom you can take by the ear and lead to Constantinople, though he has now voluntarily waited on the SULTAN. A second army was, therefore, required in the East; and, in other quarters, there are malcontent Arabs to coerce, and hostile neighbours in the wholly or partially emancipated European provinces to watch. Mr. GOSCHEN spoke highly of the powerful force which had been collected to oppose a Greek invasion if the frontier question had not been settled by the efforts of European diplomacy. It seems as if, though they have neither money nor credit, the Turks can always find soldiers; and yet Mr. GOSCHEN believes that of the hundreds of thousands who were loyally in Asia for the Russian war only a third or a fourth part have returned to their homes. It was on the eve of Mr. GOSCHEN's departure from Constantinople that the Turkish Government had to face the new and unexpected complications arising from the French annexation or occupation of Tunis. The efficient assistance which they have received from Lord GRANVILLE may perhaps in some degree explain Sir CHARLES DILKE's statement that the Armenian reforms are in a hopeful state.

#### THE LAND BILL.

ALTHOUGH the third reading of the Land Bill has been unexpectedly delayed, the progress of the measure on the Report was, on the whole, satisfactory. With the exception of one very important division and one disastrous amendment, the history of the Bill in the last week of its passage through the Lower House has been uneventful. It is not very easy perhaps to appreciate the reasons which determined the Whig members of the House of Commons to make one of the few stands they have yet made against the neglect by the Government of their most cherished principles on the occasion of the amendment moved by Lord EDMUND FITZMAURICE. That amendment, exempting from the operation of the Bill holdings rented at more than 100*l.*, had indeed the dubious advantage of in some degree limiting the harm which the Bill may do. But the defenders of the measure were able to retort with some semblance of reason that, granting the principle of the Bill itself, the amendment was rather mischievous than otherwise. Of all the sentimental ideas of the Irish peasant about the land—sentimental ideas which it is the business of this Bill to crystallize into legal rights—the most vivid, perhaps, is his objection to the consolidation of holdings. That the consolidation of holdings is of obvious benefit to Ireland, and consequently to Irishmen, is another matter. The object of the present Bill is to give Irishmen, not what is good for them, but what they desire, and they do not desire consolidation. Now that Lord EDMUND FITZMAURICE's amendment would have been a strong inducement to landlords to effect this consolidation, as rapidly as might be consistent with the restrictions imposed by the Bill, is clear. To unprejudiced observers it appears that Lord EDMUND FITZMAURICE and his friends might have been much better employed in supporting the amendments which Sir JOHN RAMSDEN did not and which Sir WALTER BARTHELOT did move. Nevertheless, the division, like that on Mr. HENEAGE's amendment, was a remarkable one, and full of warning to the Government. As before, only the support of the Home Rulers saved them from actual defeat. It was perhaps out of gratitude for this support that the

amendment which Mr. PARNELL sprung upon the House on Thursday, and which virtually re-enacts the Compensation for Disturbance Bill, was accepted by the Ministry. Nothing has been done in the direction of mitigating the rigour of the measure towards the landlords during the last seven days. Indeed, besides the concession to Mr. PARNELL just mentioned, the bonus conferred on leaseholders at the eleventh hour in Committee was an additional and serious infringement of the landlords' rights, and the refusal to recognize the cases in which landlords have themselves bought up the tenant-right without increasing the rent—cases which are known to exist in a respectable number—further demonstrated the spirit of the measure.

That spirit as it is represented in the Bill now on the threshold of the House of Lords is but little altered since its first appearance before the House of Commons. Slight but not unimportant alterations, removing to some extent the glaring onesidedness of the plan, have, indeed, been introduced in the first, the third, and the seventh clauses; but three months' discussion has hardly produced any other modifications of real value. The hostile description of the Bill at its first appearance remains, to all intents and purposes, correct—that it is an attempt to give the tenants of Ireland a new start at the expense of their landlords. The provisions for this purpose are immensely complicated, and in many cases it is difficult to say how they may work. But, if the Bill has the effect which its promoters wish it to have, the description just given will be tolerably well made out. It is far too late either to discuss the abstract justice or the practical expediency of such a proceeding; that has been done enough already. There are, perhaps, a few persons who, by dint of constant iteration, have persuaded themselves of the truth of the doctrine which three or four months ago came upon them as a startling novelty, and which is still an unhistorical invention to better instructed persons—the doctrine that the Irish peasant is a disinherited victim to whom his inheritance is now being restored by solemn process of law. With the exception of this little knot of docile partisans, one view of the Bill is probably entertained by its opponents and its supporters alike. It is a message of peace to the tenants of Ireland in the form of a cheque which is drawn on their landlords by Parliament, and which Parliament is able to insist that the landlords shall honour. This abnormal operation is regarded by some persons as a splendid act of justice and generosity, by others as a disagreeable and perilous necessity, by others as a dubious political experiment, by others as a great social and economical blunder, by others as a scandalous act of high-handed confiscation. But the simple matter of fact remains the same.

The interest which has been felt in the question, What will the Lords do with it? has been considerably abated by the understanding that the House of Lords will by no means assume an irreconcilable attitude, and that it is even dubious whether any very extensive attempt will be made to modify the measure in that House. There are certain points which have been sufficiently indicated already, notably the exemption of English-managed estates and holdings where the tenant-right has been bought up, and the fixing of a limit to the operation of the Bill—as to which something may be tried. The latest of Mr. PARNELL's amendments will also probably be heard of again. To insist on the redemption by Government of the estates of landlords who wish to sell is scarcely within the province of the Upper House. The Peers have, moreover, been relieved of great part of their responsibility by the vacillating and uncertain conduct of the moderate Liberals in the Lower House. It is no part of the duty of the House of Lords to endeavour to balance the preponderance of a particular party in the Commons, and the vacillation just referred to has made the divisions on the Irish Land Bill almost entirely party matters. Among those divisions there were many in which the weight of the moderate Liberals might have been thrown against the Government quite as legitimately as on the occasions of the amendments of Mr. HENEAGE and of Lord EDMUND FITZMAURICE. It was not so thrown, and the consequence is that the Bill goes up to the Peers with a record, broken on only two occasions, of very considerable majorities in its favour. It has, moreover, as has been repeatedly pointed out, something more in its favour than the number and the figures of the muster-rolls on which the majority of Mr. GLADSTONE has obediently answered "present" at the demand of its chief. The dominant party, to use a homely comparison but too familiar to the

ordinary householder, has acted like the worldly-wise tradesman who is called in to inspect the mechanism of a house. There may have been nothing that required his services, but he speedily contrives to make them indispensable. The leaky cistern or the smoky chimney becomes in his hands an indubitable fact, and the householder is more or less at his mercy. All practical politicians recognise that the rejection of the Bill by the House of Lords (which is indeed unlikely enough), or even a persistence on the part of the Peers in amendments directed against its spirit, would be in the highest degree unwise. Nothing, it is true, can be much more deplorable than that spirit. Mr. GLADSTONE'S remarks in the discussion on the Report as to absentee landlords are among the most remarkable that have come from the mouth of any English statesman during this century. The PRIME MINISTER is reported to have said in effect that he sympathized with Mr. PARNELL'S wish to deprive absentees of the benefit of the law, but that this was not the time for discussing the manner of their outlawry. It is probable that we may therefore look forward, if Mr. GLADSTONE is spared sufficiently long, to a measure enjoining so many months' residence on landlords, or directing, in the language of advertisements, that they shall devote their whole time to the duties of their office. Crazy folly of this kind is, of course, sufficiently far from Mr. GLADSTONE'S actual thoughts; yet it would be a perfectly legitimate inference from his words, and a sufficiently logical extension of the principle of the Irish Land Bill. Yet it should not be forgotten that another chance speech of the PRIME MINISTER'S compromised him almost as far on the other side. In the discussion on Sir WALTER BARTHELOT'S amendment, he is reported to have stated his willingness to consider in the future proved cases of depreciation of a landlord's property by the working of the Bill. These two utterances indicate sufficiently well the strange region into which the Land Bill introduces English politics and politicians. Had the attitude of the House of Commons been different, the Peers would have been amply justified in barring the gate of this region for the present. But the House of Lords is only bound to help those who help themselves. Neither in the country nor in Parliament has any definite sign of resipiscence manifested itself; and the Lords will be justified, to say nothing more, in allowing Parliament and country to be filled with the fruit of their own and Mr. GLADSTONE'S devices.

#### THE FRENCH ELECTIONS.

THE home politics of France have suddenly become interesting. Every one has long ceased to care how the existing Chamber employs itself; and until Tuesday no certain information was to be had as to when the new Chamber would be elected. At the end of last week a rumour suddenly got abroad that Ministers intended to hold the elections on the 21st of August, so that candidates and constituents were separated from the decisive day by less than a month. The indignation of all shades of the Opposition was great. They would have only four weeks in which to get up their case against the Ministry. Considering the state of habitual horror at the sins of the Cabinet in which the Extreme Right and the Extreme Left are agreed to live, it may not seem that this is an insufficient interval. Upon almost any day in the year there is enough abuse directed against Ministers in reactionary and Radical journals to furnish an ample brief for any number of candidates. Still, a good case on which candidates may insist is not everything. The candidates themselves must be forthcoming; and, though to provide them may not take long when the money is ready, to provide the money may not be so easy. Probably there was never a general election in which the defeated party did not believe that, if it had only had a little more time to prepare for the contest, it would have made a very much better fight. On this occasion the pill was made still more bitter by two other considerations. The Opposition had really been led to believe that a later day would be chosen. The MINISTER of WAR had announced that the Reserve would be called out in two divisions, the first between the 18th of August and the 14th of September, and the second between the 4th and the 29th of October. Consequently the latter half of September seemed obviously intended for the elections; and it was a genuine

disappointment after this to be told that the Government meant to hold them on the 21st of August. The second consideration was that August is seldom a month in which very much happens, so that there was every chance that, if the elections were thus hurried on, there would not be time for any new misfortune to overtake the country and to supply an additional text against the Cabinet. In ordinary years this would not have much mattered, because there would then have been no reason to suppose that the chapter of accidents was likely to contain any specially unpleasant reading for September. But this year there was good ground to hope that it might contain something of the kind. With the business in North Africa on hand everything is possible, and an election held in the midst either of defeat or of a call for additional troops might be turned to excellent account. By Tuesday the anxiety of the Opposition had become uncontrollable, and M. CLÉMENTEAU plainly taxed the Government with their change of purpose. M. FERRY declined to admit that there had been a change of purpose. To fix the date of the elections was the proper business of the Executive, and in determining to take the 21st of August the Government had only consulted the interests of the Republic. Unfortunately M. FERRY did not stop here. He went on in effect to say that the best way of consulting the interests of the Republic was to prevent Republicans from talking too much. The Government, he said, had decided that the electioneering period ought not to be a long one, inasmuch as, with the present freedom of speech and writing, the electioneering period never came to an end. On this theory a Government might give notice on Saturday of its intention to hold the elections on the Sunday, since, as the electors are always in perfect readiness for the contest, they can consequently dispense with any special preparation for it. According to M. FERRY, a French elector should always be in a position to make his choice between rival candidates, even though he may have had no intimation that his vote would be asked for until he came within sight of the polling-booth.

It is not unlikely that this speech of M. FERRY'S lost him several votes in the division which shortly followed. Even a respite of three weeks is something when an election is in prospect; and, if the Deputies had been consulted before the Government came to a decision, most of them would probably have voted for the middle of September. M. FERRY made the question one of confidence, and called upon the Chamber, if it thought that it was dealing with a Ministry of surprises, to vote for M. CLÉMENTEAU'S motion of censure, and to put an end to the situation in which the incessant attacks of the Extreme Left had placed the Cabinet. It was a handsome challenge, and it was within a very little of being handsomely taken up. Only 214 Deputies voted with Ministers, while 201 voted against them. There were 73 Deputies who did not vote at all, and it is among these that the ill effects of M. FERRY'S speech must probably be looked for. If he had been able to assign any special reason for hurrying on the elections, some of them might have supported him; but, with perverse ingenuity, he had contrived to give the impression that the Government were really anxious to cut short the discussions of their policy which will shortly begin in every constituency.

If the *Times'* Correspondent is well informed, the reason for hurrying on the elections is not so much that the Government wish to cut short discussion as that they wish there shall be nothing particular to discuss. According to this view, the Government had not, in the first instance, any intention of holding the elections before the 14th of September. The Circular from the MINISTER of WAR was intended to convey the meaning which M. CLÉMENTEAU attributed to it. Several small inconveniences, such as the postponement of the sittings of the Departmental Councils, would have been avoided, and no colour would have been given to the charge of wishing to steal a march upon the Opposition. But, within forty-eight hours from the issue of General FARRÉ'S Circular, the commander of the army in Algeria informed the Cabinet that, though no outbreak was to be expected until after August, he looked forward in September to a formidable insurrection which would require a great effort to put it down. M. FERRY had consequently to take his choice between hurrying on the elections after the Government had indirectly pledged themselves not to hold them before the 14th of September, and holding them at a time which might coincide with serious events in Africa. In these circumstances he pre-

ferred a course which would, at all events, prevent the new Chamber from being coloured in the very moment of its creation by the unpopularity consequent on the discovery that the African policy of the Government had proved more costly and troublesome than they had painted it. Whether this is a correct account of M. FERRY's motives it is impossible to say. The *Times'* Correspondent says that he has his information from a source of authority, and the probabilities certainly point to the existence of some powerful reason for anticipating the date of the elections. The constituencies will not be particularly pleased with a Minister who declares that he does not wish to give them too long an interval in which to study his merits. The more eager a man is to induce another to pronounce in his favour, the more careful he commonly is to avoid all appearance of wishing to hurry the decision. If M. FERRY has to be fitted with a motive for substituting the 21st of August for the 14th of September, the motive suggested by the *Times'* Correspondent is certainly plausible. The fact that it has such weight with M. FERRY suggests, however, a curious reflection. When Tunis was occupied, it was said that the Government wished to do something striking abroad in order to go to the country in the odour of popularity. In that case the desire of the French people for aggrandizement abroad must be exceedingly short-lived. What was intended to please them in May is treated as certain to annoy them in September. Otherwise the Government would not see in the possible coincidence between a fresh African expedition and the elections a source of Parliamentary danger which must be averted at any cost.

#### THE ARMY.

THE Extraordinary Gazette of Tuesday is a new Baptist Register for the British army. In it the regiments of the line are called for the first time by their local names, while half the officers receive a new personal title. Retirements, promotions, and a strange terminology combine to make the Gazette memorable. The names of generals whose connexion with the service thus becomes historical necessarily fill a large space. In one sense, at all events, the English army has long been the best-generalled army in Europe. It is certainly an advantage that the list of generals should bear some relation to the list from which selection would be made for service in the field. The objections to compulsory retirement only apply to the other end of the scale, and even there they have as yet hardly come into force. At the dignified, if not venerable, age to which the retired generals have attained, they must themselves have a half suspicion that younger men may be more useful in a campaign. But a man who has to leave the army at forty may fairly feel that, though he is too old to look out for a new career, he is at his best as regards the career which is being taken from him. It is inevitable that a measure of this kind when it comes to be fully applied should give occasion to many heartburnings. The best thing that can be urged in its defence is that, as it must be exceedingly unpleasant to the SECRETARY OF STATE to have to introduce compulsory retirement, it must be assumed that he saw no other way out of the difficulty which the block in promotions had created.

Even so much as this cannot be said of the change in the names of the regiments. As the eye travels along the Gazette even the civilian is conscious of a certain shock when the familiar numbers which are retained for the household Cavalry, the Dragoons, the Hussars, and the Lancers, suddenly give place to the local titles by which the infantry of the line will in future be known. If it is true that upon the day when the warrants came into force the officers of many regiments sat down to mess with crape upon their arms it cannot be pretended that the change is not very keenly disliked. That is not of course in itself a reason for leaving it unmade. The actual members of a service are often very ill-disposed to welcome necessary reforms. But it is a reason for not making it unless it was indispensable to the success of the general scheme of reorganization of which it forms a part, and no adequate evidence has been given that it was thus indispensable. The essential feature of that scheme was the localization of the army, the association of every regiment with some specific district from which its recruits should be drawn and in which its dépôt should be stationed. The value of this provision may be taken

for granted, but the regiments appropriated to each district might equally well have continued to bear their old numbers. The substance of localization would have been secured; the difference would have been that the 30th and the 59th would have made up the East Lancashire regiment, and not, as is the case now, have been transformed into the East Lancashire regiment. In this way the past history of the army would not have been wiped out. Each regiment would have retained before men, as well as in its own consciousness, the recollections associated with the Peninsula, with the Crimea, or with India; while it would have added to this whatever advantage there is in permanent association with particular districts. This has actually been done in the case of special titles. If the Somersetshire regiment may still be called Prince Albert's Light Infantry, or the West Yorkshire regiment the Prince of Wales's Own, it is hard to see why a similar relaxation of the rule should not have been permitted in cases where the regimental numbers were equally distinctive and at least equally honourable.

On two other days within the last week military affairs have had their share of public attention. On Saturday the LORD MAYOR entertained a large number of Volunteer commanding officers at the Mansion House, and the Duke of CAMBRIDGE took the opportunity to speak in very high terms of the behaviour of the Volunteers at Windsor, and to say, very justly, that his praise would not have been valuable now if it had not been withheld in the days when it was less deserved. It is quite true that "if faults had not been honestly, fearlessly, and frankly stated," the Volunteers would never have arrived at the position they now occupy. Indeed, if there is any charge to be made against the military authorities in connexion with the Volunteers, it is rather that they were slow to discover how anxious the Volunteers were to be found fault with. The Volunteers had made a military standard for themselves long before the War Office thought it worth while to make a standard for them. If they had been contented to take advantage of all the allowances of which they were offered the benefit, they would have remained at best showy inefficient. It was by insisting that more should be demanded of them that they by degrees induced the military authorities to believe that it might be worth while to give them what they asked. As Lord ELCHO pointed out, the present value of the Volunteers is not to be measured by the actual number enrolled. Now that a certain minimum of efficiency is exacted from every Volunteer, a man who is no longer able to attend drill has to leave the force. The result of this is that, in the event of an invasion, we should command the services of a large number of men whom a very short period of training would make as efficient as any actual Volunteer. Lord ELCHO reckons that there are 800,000 men forming this unrecognized Volunteer Reserve, which, with the numbers actually enrolled, would give us close upon a million of men who have received the rudiments of military training, and the majority of whom would be willing to give their services for home defence. The next demand that the Volunteers ought to make upon the War Office has only an indirect reference to themselves. They cannot do much to improve their present qualifications unless some mode can be discovered of giving them the assistance and co-operation of cavalry and artillery. At present they possess, and to all appearance are likely to possess, neither. How the deficiency is to be made good we cannot pretend to say, but the question is one that has a genuine claim on the attention of the Government. The Volunteers will not be raised to the full development of which they are capable until the defence of the country may be entirely trusted to them should it suddenly become desirable to send every available battalion of the regular army abroad. It may not be possible to bring the force to this pitch of perfection, but it certainly cannot be expedient to rest content when we have not made a single step towards its attainment.

On Monday the Duke of CAMBRIDGE presented their commissions to the Woolwich Cadets who have successfully passed their examinations for the Artillery and the Engineers. On this occasion the DUKE showed that his power of distributing blame was fully equal to his power of distributing praise. The condition of the Royal Military Academy seems to call, however, for something more than speech. When the COMMANDER-IN-CHIEF has

occasion to tell the young men destined for the Scientific Corps that he is far from satisfied with the reports of their conduct; that their behaviour during the time to which those reports relate has been ungentlemanlike and unsoldierlike; that they cannot expect men to obey those who do not themselves understand obedience; and that discipline, if they will not yield to it of their own free will, must and shall be enforced—matters must have come to a serious pass. Nor have the Cadets made up by proficiency for what they want in conduct. The results of their study leave much, the Duke says, to deplore. They are careless about the subjects which it is most essential for an officer to know, and waste such attention as it suits them to give upon subjects which, though they bring marks, are of very secondary importance from a military point of view. If these uncomplimentary criticisms are well deserved, they reflect discredit not merely on the Cadets, but on the authorities who have the charge of them. The Governor is described in the newspaper reports as certifying that the conduct of those to whom commissions were presented had been marked during their stay at the Academy by the highest discipline and obedience to orders. Either, therefore, the Duke of CAMBRIDGE has been misinformed or the Governor's commendations have ceased to bear any meaning. As regards the proficiency of the Cadets, if the study of extra and optional subjects is found to distract them from purely military subjects, why are prizes given in them? If, again, 18,000 marks are too low to entitle a man to a commission when, in the same examination, another Cadet gets 46,000, why is the margin allowed to be so large? The minimum ought to be fixed at a point which is evidence of sufficient preparation—not merely of such preparation as the Duke of CAMBRIDGE describes in his speech. The matter is one which certainly suggests further explanation.

#### AMERICAN AGRICULTURAL COMPETITION.

OF all the secrets of the future, there are few which it more concerns Englishmen of every class to guess rightly than the effect of American competition on English agriculture. Lively effort, therefore, made with any fair degree of intelligence and knowledge to read the riddle is to be welcomed, and the effort made by Mr. BLAKE in a recent pamphlet deserves serious consideration. Mr. BLAKE represents in Parliament the county of Waterford; he is a landowner, and has a substantial personal interest in arriving at a right conclusion, and he has taken the trouble to go to the produce-growing districts of the United States and see on the spot what American competition means. The most valuable part of his production is that in which he shows that American competition is as yet in its infancy. It will, he thinks, take five or six years to perfect the machinery by which England is to be inundated with American meat and American grain. Produce has first to be produced, and then brought to market, and producers and carriers are only as yet on the threshold of their respective enterprises. The stock of cattle in American cattle-growing districts may and will be doubled. The owners of cattle are setting themselves energetically to doubling it; but a stock of cattle cannot be doubled in a day or a year. What is certain is that, when the time has elapsed which is necessary to make it a physical possibility that the stock of American cattle should be doubled, it will be doubled. Any amount of corn can be grown in the western districts of the United States and Canada; but it is only where a railway runs that corn can be grown for any other purpose than that of feeding pigs, or rotting on the ground. Railways are being built, but they are not finished. As they go on, the land adjacent to the line is taken up, and brought into cultivation. Time is needed to build the line, to attract settlers, to enable the settlers to get over their first difficulties, and, lastly, to grow a marketable surplus. Here, again, as in the case of cattle, a process is going on the fruits of which are not visible as yet, but must show themselves before long. At the same time, improvements are continually going on which make production easier or make produce of a better quality. New machinery is constantly being devised to save labour, and such articles as bacon, which in America is relatively bad, because the pigs are fed carelessly, is being made better by more attention being given to the feeding of the ani-

mals. Very great improvements, too, are being introduced into the carrying business. Powerful and large vessels are being built expressly adapted for the reception of live cattle; ingenuity is busily at work to reduce the cost of keeping dead meat fresh; and what is at present the great obstacle to the importation of American dead meat—the defectiveness of the arrangements for treating and distributing it on the English side—is sure to be remedied. Here, again, time is necessary to direct English capital and energy into a new direction; but the time found necessary is not likely to be very long. Mr. BLAKE's estimate of five years appears to be ample; and there seems to be no reason for doubting that in five years' time American agricultural competition will tell on English cultivation with a force very much greater than that which it now exercises.

There is also, we think, much justice in the observations which Mr. BLAKE makes on the objections which are usually made by those who try to make light of American competition. The cost of carriage and freight is necessarily a drawback to the American competition; but experience shows that, in spite of carriage and freight, American produce can be landed here at a profit-yielding price which is very considerably below what the farmers of the United Kingdom have been in the habit of receiving, and the cost of carriage and freight is much more likely to go down than to go up. There is not the slightest prospect of American land becoming exhausted. The soil of the great Canada wheat district, a thousand miles long by three hundred wide, is said to be of such a nature that it fertilizes itself, and this very peculiar soil stretches a considerable distance into the United States. This is what Mr. BLAKE states, on the authority of local experts; but, even if the statement is an exaggeration, there can be no question of American soil being exhausted within the period when American competition will begin to tell with its full force on English production; and there is no limit to the American territories in which cattle can be produced in illimitable quantities and produced for ever. An adequate supply of labour will be provided by the vast stream of European, and especially of German, immigration; and, although this stream may some day fall off, yet it happens that the stream is stronger than it has ever been known to be at the very moment when additional labour is needed to fulfil the prophecy that in five years' time the full effects of American competition will be felt. Some day, perhaps, a larger portion of English land and of the capital and energy of English farmers will be devoted to the rearing of poultry and to the cultivation of vegetables. But, although these are very valuable adjuncts to a good system of general agriculture, they can never replace such a system. If we lose the business of supplying our own population with bread and meat, we cannot make good the loss by developing the business of supplying the masses with eggs and French beans. Lastly, Mr. BLAKE, as an Irish member, finds it natural to notice the sanguine views of those who dream that the Land Bill will enable the Irish farmer to compete successfully with his American rival. The Irish Land Bill at the very best will only enable the actual cultivator of twenty acres of wet poor land to make as much out of them as a needy ignorant laborious person can make out of them. The utmost efforts of such a man will only make him a little less of a struggling pauper than he has hitherto been, but can have no possible bearing on the general effects of American competition.

When we come to Mr. BLAKE's estimate of the probable consequences of American competition, we feel ourselves on ground much less firm and sure. He tells us that he had studied the calculations of Mr. ATKINSON, of Boston, who had prophesied that English rents would be wiped out altogether; that, on arriving in the States, he had a long conference with the prophet; and that the final result of the discussion, and of all his own observation, was to convince him that Mr. ATKINSON was quite wrong—that things would not be half so bad for landowners like himself, and that it was safe to put down the permanent reduction of rents at one-third. No figures are given to show why this point of reduction is taken rather than any other; and, of all the data with which Mr. BLAKE could have provided us, these are the figures that would have been most interesting. Let us, however, for the moment assume that Mr. BLAKE is right. If, then, one-third is taken off rents, the British producer will be able to

compete with the American. He will sell at a fair profit all he can produce. He cannot produce enough for the needs of the English population; but, as he will sell whatever he produces, all that the American competitor can send will be that quantity by which the English demand exceeds the English supply. There is no other great country to which he can send his surplus, for every great country besides England will guard its own agriculture by protective duties. This solitary opening, the supply of what one great country cannot produce for itself, seems a remarkably small one in comparison with the enormous increase of American production which we are told is going to take place. What is to become of all the cattle and corn which is to be produced in America? It will be confessedly in excess, and very largely in excess, of what the American population needs for its own consumption. It will also be enormously in excess of anything that England will take on Mr. BLAKE's supposition that, if they get a third of the rent taken off, English farmers will produce as much as they do now, and sell it at a profit, while the rest of the Old World will decline to take it unless the local harvest happens to be so deficient that import duties can be paid and yet a profit be left to the importer. It seems obvious that, if Mr. BLAKE is right, the Americans are going into over-production on a gigantic and ruinous scale. Even if Mr. ATKINSON were right in his gloomy prophecies, and English rent disappeared, the English farmer, if allowed to cultivate the land, would still produce as much as he does now, and the opening for American produce would not be increased. There would still be nothing to supply except what is represented by the margin between English production and English consumption, and this is really a mere fleabite as compared with what the Americans propose to produce. There are, no doubt, many other things to be taken into account; but, as Mr. BLAKE puts his case, it would appear that, when his five years are up, the American producer would be quite as much in danger of ruin as either the English farmer or the English landlord.

#### THE UNIVERSITIES COMMISSION.

THOSE who have watched with a mixture of perplexity and disappointment the action of the University Commissions instituted five years ago amid such sanguine expectations, will probably acquiesce gladly enough in the measure which Lord SPENCER has brought into the House of Lords. The powers of the Commissions expire this year; and it is proposed to transfer them to that Committee of the Privy Council which, according to the original plan, was to serve as a tribunal of reference after the Commissions had terminated their labours. Those labours have unfortunately resulted in some cases in suggestions which are almost equally disapproved by the most opposite parties in either University. The proposed Committee, composed as it will be almost exclusively of high official personages, is likely to exercise a much soberer judgment, and to be a much less convenient tool in the hands of crotcheters. The Chancellors of the two Universities, the President of the Council, the Lord Chancellor, and other persons of the same standing may be fairly trusted to decide questions of reform much more in accordance with common sense and the general needs of the University and the country than in accordance with the views of this or that advocate of ingenious schemes for the redistribution of funds and studies.

#### METHODISM.

IT may be doubted whether many Anglican prelates or clergymen, or for that matter Wesleyan ministers either, would be disposed to endorse the assurance proffered the other day by Bishop Ryle to the President of the Wesleyan Conference, that their respective communions are simply "different regiments" in the same general army of "the Church of Christ in England." But there can be no doubt that the large proportions Methodism has assumed in England and America make it a phenomenon of considerable importance, and fully suffice to explain the elaborate disquisition on its history and organization which occupies the first place in the *Edinburgh Review* for July. The writer computes the English Methodists at five millions and the Americans at fourteen millions, while he rates their ecclesiastical property in Great Britain at eleven and in America at eighteen millions sterling. *Whitaker's Almanac* for 1881 gives 14,500,000 as the total figure

of "Methodists of all descriptions throughout the English-speaking world." Possibly the truth may lie somewhere between the two, but even at the lowest computation be adopted, it is sufficiently large. It should be remarked, however, that five sects or schisms have broken off from the parent stock, and besides the Wesleyans or Methodists proper, with whom alone the *Edinburgh* writer concerns himself, we have the New Connexion formed in 1797; Primitive Methodists in 1810, who, according to *Whitaker*, number in this country nearly half as many adherents as the original body; Bible Christians founded in 1815; United Methodist Free Churches, who separated in 1834—demanding, like the New Connexion, larger powers for the laity—and who come next in number to the Primitive Methodists, having about a third as many members; lastly, the Wesleyan Reform Union, who seceded from the Free Churches in 1849, but have only some 7,000 members and 18 ministers in Great Britain. There is scarcely a shade of doctrinal difference between these various communities, their dispute with the main body of Wesleyans and with each other turning on points of ecclesiastical discipline, to which reference will be made presently. With the broad facts of John Wesley's career and the circumstances which led to his gradual alienation from the English Church and very unwilling creation of an independent sect, which has proved in the sequel far the largest and most influential, though not the bitterest, of her rivals—we will not say of her foes—the reader may be presumed to be familiar. The Wesleyans indeed profess themselves "the friends of all, the enemies of none," and we have heard of a worthy Methodist elder assuring his Vicar that they are "the pillars of the Church"; but the claim can hardly be admitted, even in the restricted sense applied to the churchmanship of Lord Eldon, for they not only never enter the church themselves, but have not discharged the office of external buttresses with any very marked success. The famous passage where Macaulay suggests how a wiser policy in the ecclesiastical rulers of the last century might have made John Wesley to the Church of England what Ignatius Loyola was to the Church of Rome, has been read with a smile or a sigh by many successors, both of his and of theirs, in our own day; but it is too late now to repair a fatal mistake. Whether anything can still be done to arrest its further consequences is another matter. The first step, at all events, towards any such undertaking must be to gain clear appreciation of the facts. And there can be no doubt that Methodism differs widely both in its origin and its characteristic features from the ordinary forms of Dissent, though it may be questioned whether the spread of Liberationist principles has not tended of late years to obliterate or modify the difference. Wesley himself was so far from having any quarrel with the doctrine or discipline of the Church of England, as such, that to the last he considered it far the nearest approach to Apostolic Christianity in the world; he strictly forbade his preachers to hold services during the hours of worship at the parish church, or to presume in any case to administer sacraments; and it was only under pressure of what he believed to be necessity, and after the Bishop of London (Lowth) had refused to act, that he at length essayed in union with two other Anglican clergymen to ordain a Methodist "bishop" for America, where an episcopal form of government is still retained among his followers. It was the spectacle of the "soul-damning clergymen" of his day which troubled him; and Methodism arose, not, like other sects, to reform an erroneous system of ecclesiastical polity, but to promote personal holiness.

The line of demarcation between Dissent and Methodism has been well defined from the beginning. Methodism sprang from a sense of personal guilt before God; Dissent arose from the conviction that Episcopacy was wrong. The quarrel of the former was with incision, of the latter with prelacy. Dissent discussed theories of Church government as though the salvation of the world depended upon the adoption of some particular scheme. Methodists declared that their prime purpose was "to reform the nation, more particularly the Church, and to spread Scriptural holiness over the land." "Dissenters," said Wesley, "began everywhere with showing their hearers how fallen the Church and ministers are; we begin everywhere with showing our hearers how fallen they are themselves." Dissent magnified the congregation and made it honourable; Methodism originated the "United Societies" which were to have close connexion with one another, and always to act in unison. Dissent boldly separated from the Church; the Methodist leaders declared that they "obeyed the bishops in all things indifferent, and observed the canons as far as they could with a safe conscience." Their separation was gradual; it continued through many years, it was accompanied with fond regrets, and it has tinged, though with gradually fading tints, the intercourse of the Church and Methodism.

It is quite consistent with the origin and practical purpose of the movement that, as the Reviewer says, Methodism should be "built upon the class meeting as its germ cell." This meeting consists of some fifteen or a dozen persons, of either sex, who assemble weekly, under direction generally of a layman, for spiritual converse and instruction, and for something very like what is elsewhere practised under the name of confession. It is said to provide a powerful means for checking immorality, as well as for impressing the true Methodist stamp on members of the body, while at the same time it has—in common with the various Roman Catholic guilds, brotherhoods, and the like—one great indirect advantage in providing an occupation and outlet for the religious energies of laymen, which, at the time of the Wesleyan movement, were very much left to run to seed in the Church of England. It is also, like Catholic confession, part of the prescribed preparation for Communion. And, inasmuch as "in Methodism finance is always allied with religion"—for John Wesley had a

shrewd talent for the exigencies of government—the weekly contributions collected at these class meetings form the principal support of the ministry. But the class meeting is also part of a wider scheme of spiritual organization, or, as some would say, spiritual despotism. Not only is every member watched carefully by the leader of his class, but once a quarter the regular minister comes to inspect both class and leader, when tickets are given to approved members, while peccant members are censured, and may, after appealing to a regularly graduated series of courts, be finally excommunicated, the sentence being always reserved to the ministry. There is a division of “circuits”—roughly corresponding to dioceses—each under its own “superintendent,” who controls the ordained and lay preachers within his district. Another Methodist institution—less important, however, than the class meeting—is the “love feast,” or *agape*, which Wesley introduced as a revival of primitive practice, and another is the “watch-night,” professedly modelled on the vigils of the early Church. No such ancient precedent can be claimed for “the renewal of the Covenant,” which takes place on the first Sunday of the year, though it bears some analogy to the renewal of baptismal vows usual at the close of a modern Roman Catholic mission. It may be observed in passing that the buildings used for Methodist worship, at first of the very plainest, not to say ugliest, construction, are now apt to be as ecclesiastical as an architect chosen after open competition can make them, and indeed a very little modification, as the reviewer observes, would render many of them “perfect for the celebration of the most advanced ritual.” The services conducted in them fall into two distinct types, liturgical and non-liturgical, the former following very closely the order of the English Prayer-book, only that the minister is forbidden to wear any distinctive dress, not even “gowns or bands.” We have heard reports, however, of functions in some of the larger Wesleyan chapels on solemn occasions, where the Anglican service, or something indistinguishable from it to a casual observer, was chanted by surpliced choristers. A Wesleyan writer says there are some of his coreligionists “whose passionate love for the Liturgy can find no fainter expression than this; ‘I find no fault in it at all.’” The Wesleyan hymn-book has become less of a distinctive badge since hymnology has been so largely introduced into the services of the English Church; but it had *inter alia* a directly doctrinal import, as may be seen from the following couplet, omitted, it seems, at the last revision:—

The Unitarian fiend expe,  
And chase his doctrine back to hell.

And now it is time to say something of the crucial question of the organization of the Methodist ministry, which in spite of all disclaimers of “the notion of a succession of bishops conveying by digital contact from age to age the whole volume of divine grace”—a snare perhaps prompted by the consciousness that the succession had been deliberately broken—must be allowed to be framed on a strictly “sacerdotal” principle. In Wesley’s time, as we have seen, his preachers were interdicted from performing any sacramental acts, but with the definite separation from the Church which at once followed on his death this prohibition necessarily fell through. There is still, however, a distinction preserved of clerical and “local” preachers, the latter being mere laymen and restricted to lay functions. Women, like “Dinah Morris,” were at one time to be found among the lay preachers, but this innovation provoked severe censure, and was soon suppressed by authority. The preacher of a funeral sermon had already significantly remarked that “Bulham was converted by the braying of an ass, Peter by the crowing of a cock, and our lamented brother by the preaching of a woman.” All appointments of preachers are in the hands of the Conference, not of the lay Trustees of Chapels, who did indeed long contest the exclusive claims of the clerical hierarchy, but were gradually and completely defeated, so carefully had the deeds been drawn under Wesley’s eye. In 1835 a case came on appeal before Lord Lyndhurst, as Lord Chancellor, which settled the legal bearings of the question in favour of the ministry, who did not hesitate thereupon to recognize his lordship as “in his official capacity a minister of God for good.” We have said already that chapels are grouped into “circuits” under their respective “superintendents”—in America he has the title of “bishop”—but all these circuits are under the supreme control of the Conference, which is “heir to Wesley’s spiritual despotism and irresponsible power.” For eighty years a war was waged to procure the admission of the lay element—as it has come to be called in our day—into Conference, but in vain; “Wesleyanism stood firm by its bolted doors.” An attempt was once made to starve the Conference into submission, and 100,000 members seceded, but it did not yield. It is true that in 1877 a mixed or representative Conference, comprising equal numbers of ministers and laymen, 240 of each order, was established for purely temporal matters, but “the Legal Conference,” of 100 ministers, established by Wesley himself, which is alone suffered to deal with spiritual matters, and whose confirmation is required for the temporal acts of the representative Conference, remains intact. And thus “the keys are still in the hands of the ministers; like Thomas à Becket, they will only permit clerics to try clerics, and to admit into the church and expel from it.” It must certainly be allowed that this “nondescript presbytery,” which disclaims all “succession by digital touch,” manages to “write its priest very large.” The Conference distinctly asserts that it is composed of “ministers and pastors empowered not only to preach the Gospel, but to administer the Sacraments of our holy religion,

and charged with all the responsibilities of the Christian pastorate.” Nor is this a mere empty profession, but the assertion of a right which is jealously maintained. When challenged to admit lay delegates, the Conference summarily refused to entertain “any proposal which would go to transfer, altogether or in part, the responsibility of the sentence in disciplinary cases from the pastorate to the lay officers. To adopt such a course of procedure would be to give up a principle which, in the judgment of the Conference, is essentially inherent in the pastoral office.” The extreme “sacerdotalist” could not say much more. And not only is it maintained that “our Lord left the keys—the general government of the Church, and special binding and loosing of its members—to the Church itself, as represented by the men whom the Spirit would raise up to represent its authority”—namely, the ministers, but both the Conference and its district Committees claim the “undoubted right” of what is called “friendly examination,” but which would ordinarily be termed inquisitorial investigation into “the moral, Christian, or ministerial conduct of the preachers,” even though no formal or regular accusation has been preferred against them. The following account of the proceedings of Congress will be read with interest, perhaps with envy, by some who may regret the more limited powers of the assembly with which it is here contrasted:—

The Wesleyan Conference meets annually in some large and generally antique chapel, the doors of which are jealously guarded. No layman, no representative of the public press, no unaccredited minister can enter; but the Conference will, through its official “minutes” and through privileged ministers, furnish such accounts of its proceedings as it thinks fit to the public. The floor of the chapel is occupied by non-official members, the galleries are the haunt of very young ministers, and a platform supports the president, ex-presidents, secretaries, and a few officials. The atmosphere of the assembly is unique. The business is transacted with the precision of a merchant’s office under the religious sanctions of a synod. Accounts of moneys paid and received are examined, while pastoral addresses to various foreign conferences are read, and priestly benedictions roll over the clinking of the coins on the money-changers’ tables. A Church congress talks in hopes that some grains of wheat may be fanned from the chaff; the Wesleyan Conference talks that it may legislate. Convocation debates with a haunting and irritating remembrance of past power; the Wesleyan Conference argues and decides with an increasing confidence in the acclamations that will meet its decisions. Representatives find their way into the Methodist assembly from affiliated and derived communities in France, Canada, the United States, and Australia, and the preacher from an obscure country circuit, seeing them in the flesh, grows proud of a community on which the sun never sets. In the ordinary course of things, the subjects of debate are mere matters of routine, and only interest the Connection; but occasionally matters of more general importance are discussed—such as an *excommunication* from a zealous Churchman, which is sure to awaken the old controversies; the attitude of the Wesleyan denomination towards education; or the imperilling of the unity of the ministry by the over ardent action of some ecclesiastico-political preacher who contends that his absorption in the Wesleyan system does not militate against his taking part in some momentous question of a national character.

We have not left ourselves much room to speak in detail of the social, political, or theological aspects of Methodism. The two last are no doubt partly dependent on the first. If there be any force in the taunt sometimes aimed at recent conversions to Rome, that “there are plenty of Scotch duchesses, but no English grocers,” the precise opposite holds good of the triumphs of Methodism. It has never attracted the upper classes, and it retained no paramount influence over the poor. “The prosperous mechanic, the well-to-do tradesman, the manufacturer, for one or two generations, are its chief supporters.” It has ever been what Mr. Arnold would call a Philistine religion. It has not, indeed, as we have already intimated, coalesced with the general line of political Dissent. At one period a leading Wesleyan was expelled for joining the Liberation Society of his day, but no such sentence would have any chance of passing now. In the educational contest of ten years ago the Wesleyans were somewhat divided, but they generally acquiesced in the compromise proffered by Mr. Forster, which was really far more favourable to Dissent than to the Church, for the alternative of Bible teaching in Board schools, without any “denominational formulas”—which they do not possess or value—gave them all they wanted. The *raison d’être* of Methodism, as the reviewer justly observes, does not lie in its tenets, but in its peculiar organization and adaptation to practical ends. It has a tolerably marked and somewhat narrow type of theology, but no Confession of Faith. Dr. Pope insists that it is materially, if not formally, bound by the three Catholic Creeds and the Articles of the Church of England, but he adds that this assertion “must be taken broadly,” as the Connection has never made itself responsible for any of these formularies. He more summarily defines Methodist doctrine as “what is generally termed Arminian,” and as laying great stress on personal assurance. And his statement altogether applies only to the Methodists proper and not to the minor offshoots from the parent stem. But within these limits it is true enough that a remarkable unity of doctrine has been preserved among the ministers, and that any semblance of heterodoxy or novelty among them would be steadily repressed. It is said that a mere suspicion of his leaning to the theory of evolution has debarred the only one of them who ever achieved the least scientific distinction from the Feruley lectureship, a kind of Methodist “Bampton.” And the rigid constitution of the sect secures to it a far more effective control over diversities of teaching than can be found in the more lax and tolerant rule of the Anglican Church. And hence among the English middle classes it is a strong bulwark of Protestant orthodoxy, as opposed to broad Church tendencies on the one hand or “Romanizing” on the other. How long it will continue to hold its own against

the opposite assaults of the *Zeitgeist*, secular and religious, is a question more easily asked than answered. As yet four quarterlies and some 150 periodicals attest the literary energies of Methodism in its various branches throughout the world.

#### A KISS FOR A BLOW.

THE monopoly of all excellence which is well known to belong to the present Ministry and their partisans could hardly have been better shown than by the dinner which the City Liberal Club gave on Wednesday night to Mr. Goschen. Their possession of the heathen virtues of courage and justice has been sufficiently vindicated by the Transvaal arrangement and the Irish Land Bill. Intellect is an inheritance of the Radical rather than the Liberal party, which is disputed only by those who have no intellect to boast of. But the specially Christian excellences of humility and forgiveness of injuries have not hitherto been displayed in any striking measure by Mr. Bradlaugh's friends. An opportunity presented itself in Mr. Goschen's return, and it was promptly embraced. The City Liberal Club invited Mr. Goschen to dinner, and did not cancel the invitation, despite the notoriously bad conduct of the guest. Set free from the bondage of dinners and tennis at Constantinople, Mr. Goschen has apparently taken pleasure in treading on the most cherished corns of his Radical friends ever since his return. He described their home policy at Ripon in terms which might grace the mouth of the most rabid Tory. He entirely ignored the occasion which presented itself on Monday of protesting against a policy of blood-guiltiness and asserting the immeasurable moral supremacy of the man who yields to kicks what he has refused to yield to argument. Worse than all this, he actually on Tuesday voted against Mr. Gladstone, and rubbed shoulders in the division lobby with atrocious abettors of *l'infamie*—which is suggested to modern Radicals as a very convenient and summary expression for everything that Mr. Gladstone does not happen to like. Even Sir William Harcourt had to confess at the dinner itself that the last place in which Mr. Goschen's friends could hope to meet him was the division lobby of the House of Commons. He has since the banquet been lectured more in sorrow than in anger by the *Daily News* for his deficiency in moral sympathy and his false conception of national honour—his deficiency, that is to say, in sympathy with the designs of Irish tenants on the pockets of their landlords, and his invincible blindness in failing to appreciate the decoration of the Boot. But the City Liberal Club, though they knew all this but too well, forgave it. They gave Mr. Goschen his dinner, and the speakers availed themselves of the occasion to compliment each other in a more literally liberal fashion than we remember to have noticed in the speeches of any similar entertainment. The method of proceeding was, indeed, borrowed from that of the celebrated Irish regiment which solved the difficulties of existence by means of a perfected circle of accommodation bills. Sir John Lubbock praised Lord Granville (but this was a bye, for Lord Granville was unfortunately absent); then the business began, and he praised Mr. Goschen. Mr. Goschen, in turn, praised Sir John Lubbock. Sir William Harcourt praised everybody. Mr. Grant Duff praised Sir Charles Dilke, and Sir Charles Dilke praised Mr. Grant Duff. "Every fellow likes a hand," as a great authority has it, and on this occasion every fellow certainly got it.

On Mr. Goschen's own speech there is little to say. His reasons for dissembling his love of the Liberal party were given with as much frankness as became the occasion. That occasion, as has been pointed out, was rather a melancholy one. It must have occurred to everybody, "Where is the Duke of Argyll?" A banquet to the Duke of Argyll seems to be a necessary corollary or sequel to the banquet to Mr. Goschen. Enthusiastic Liberals themselves tell us that Mr. Goschen is their ablest man in the House of Commons, putting Mr. Gladstone out of the question, and that the Duke of Argyll is their ablest man in the House of Lords. If this be so (and it would be impertinent for the outsider who pretends to no knowledge of party secrets to gainsay it), their case is certainly hard. However, fortunately Mr. Goschen still has his Continental and Constantinopolitan experiences to talk about, and he described with much facetiousness the state of Turkey. When he remarked that Abeddin Pasha had said to him "You find Ireland a trouble; in Asia Minor we have fifteen Irelands," the City Liberals laughed consumedly. Possibly a patriotic Turk might find it a little hard to appreciate the joke, and might be disposed to add to Mr. Goschen's list of "plague of Albanians," "plague of Armenians," "plague of locusts," &c., the item plague of ambassadors, as a not inconsiderable article in the catalogue of Turkey's ills. However, of a man who is having a dinner given to him, especially under such very peculiar circumstances, too much must not be expected. Mr. Goschen was not ridiculous, and for a person in a very difficult situation that is always a great deal. The interlude of Mr. Samuel Morley, with his friend who had just been giving his own view of the Irish Land Bill to several Irishmen in order to prevent them learning a one-sided account of the matter, and his happy oblivion of Mr. Bradlaugh for the moment in his anxiety about bankruptcy and water, let in the Home Secretary, who was the star of the night. We use the expression not in the least ironically, for, putting the guest out of the question, Sir William Harcourt was certainly surrounded by very *minores ignes*. Mr. Browning has spoken of "my star that darts the red and the blue." Sir William Harcourt was equal to this variety of chromatic effort.

After trying his powers on Sir John Lubbock, he proceeded to eulogize Mr. Gladstone in a strain of the most exalted eloquence. "In the malaria which oppresses the marshes of mediocrity," it appears the Home Secretary thinks "there is something that refreshes the spirit in the contemplation of the high landscape and lofty outlines of these elevated minds." From a careful study of reports, it seems that some ill-conditioned person—an official in Sir William's own line, Mr. Nupkins, of Ipswich, had experience of a similar one—mistook the malaria of the marshes of mediocrity for a joke, and laughed at it as such. This mistake was to the last degree excusable. But it would follow—and the consequence is too horrible to be pursued much further—that, if it was a joke, Sir William was poking fun at the moral outline of his revered chief. As this is evidently impossible—especially in the face of the City Liberal Club, elevated, in Sir William's own words, if only with wine, and ready to take the most terrible vengeance on a profaner of the shrine—it can only be supposed that the Home Secretary, who used to possess a sense of humour, has immolated it at that identical *sacellum*. The same conclusion may be inferred from other passages of this remarkable oration. "He was good enough," said Sir William, speaking of the guest of the evening, "to inaugurate me in public life upon a platform at the Cannon Street Hotel." The particulars of this outrage, it will be seen, are given with a precision very creditable to the head of the judicial and legal departments of the Executive. It was on a platform at the Cannon Street Hotel that Sir William was inaugurated. "Is it," said Major Pendenis—"is it done in public—the plucking?" The inauguration was evidently done in public, though we are not informed what the flight of birds was which Mr. Goschen consulted or what they said about the future Home Secretary. Considering all things, it would seem that it was rather Sir William Harcourt's place to consult the omens about Mr. Goschen. It is a melancholy tale they would have had to tell. For it was in this very speech that the bitter cry already alluded to broke from Sir William. "We should be very happy to meet him in the lobby." But that is exactly where his quondam friends do not meet Mr. Goschen. "He has more wit than to be there." To persons of superficial and limited understanding it seems that in the fact there are included numerous minor facts upon which the City Liberals would do well to meditate.

After the Home Secretary, the lesser people naturally had their turn. Mr. Grant Duff is able to declare on his honour and conscience that in all the six Parliaments in which he has sat there has never been such a collection of able Liberals as in this one. Nor was the new Governor of Madras content to rely on the safe argument of the Yorkshireman who contended that, as Yorkshire was the biggest county of England, it was necessarily the best. The present Liberal majority being bigger than any in which Mr. Grant Duff has served, it ought obviously to contain more able men as well as more—but it is unnecessary to continue the sentence. Mr. Grant Duff's assertion, however, is positive. But he was good enough to take notice of the fact that this ability has been remarkably little *en evidence*—so remarkably little, indeed, that if Mr. Grant Duff did not vouch for it, it might possibly be doubted by the careful student of debates. The reason is, that the able persons have "sat with a patience and self-abnegation which were remarkable." It is obvious that if you do nothing but sit with patience and self-abnegation (we should have gone further than Mr. Grant Duff, and said that the Liberal majority had also voted with a patience and self-abnegation which were more remarkable still) you cannot display any shining personal merits. There was one person whose merits, however, were in evidence, and that was Sir Charles Dilke. It is only a pity that Mr. Grant Duff did not continue to expatiate a little on the merits of the Under Secretary for Foreign Affairs. A detailed panegyric on them would have been decidedly interesting. The intrepidity with which Sir Charles Dilke intervened just at the right moment in the Candahar debate, and announced intentions on the part of the Czar of which, as has since been shown, that monarch was totally guiltless, would have been a capital subject for a glowing passage. His ignorance of the very existence of Herr Most, who was well known to most students of foreign politics as a leader of the Socialist party in Germany, would have been a capital illustration of the "great knowledge" which Mr. Grant Duff attributed to him. Of the "consummate Parliamentary tact" simultaneously attributed, it is doubtful whether the Candahar manoeuvre just referred to, or the admirable explanation in reference to communications with Meshed which has since been achieved, would have been the most crucial instance. A statesman who is able to explain that, when he said that Her Majesty's Government had no means of communicating telegraphically with a certain place, he meant that their agent at that place was a Persian gentleman, ought to go far. The astonishment of those who read or heard Sir Charles Dilke's first answer, mindful of the many private despatches from Meshed which they had themselves seen, was, no doubt, quieted by the Under Secretary's reply to Mr. Stanhope in the most complete manner; and it is probably from their number that the warmest acknowledgments of his Parliamentary tact would come. It is true that but a year or two ago examples of tact of a similar nature would have met with the severest reprehension from the speakers at Wednesday's banquet. But we have changed all that, and the great conscience of the nation is at rest.

There is unhappily no means of knowing what Mr. Goschen felt

when he was accused of inaugurating Sir William Harcourt, or while Mr. Grant Duff and Sir Charles Dilke were exchanging amœboan strains of mutual admiration and esteem. These things are not reported. Perhaps he sighed for the cigarettes and lawn tennis of Constantinople, perhaps for the blue posters and orange rosettes of Ripon. At the precise passage of Sir William Harcourt's speech which related to the lobby it might be possible to formulate his thoughts. But the formula would be of so familiar, not to say vulgar, a nature that we shall not attempt to defile the paper with it.

#### MR. PALEY ON ENGLISH POETRY.

MR. PALEY has given evidence of a singular, if not unique, literary taste in his prose translations of the Greek classics, especially of Pindar and Æschylus. Many a time have his somewhat prosaic versions of famous passages lightened the labour of study and brought a smile to the lips of the fatigued student. It is Mr. Paley who made Prometheus, speaking like an Alpine Club man, "keep a miserable watch on the topmost rocks of this crevasse." He, too, made the Chorus in the *Suppliants* wish that the Herald "had perished, with your imperious insolence, and your peg-fastened ship besides." Several such examples of his taste led us to expect edification from Mr. Paley's essay on the latest school of English poetry, which is printed as a preface to a selection from the poetry of Lord Byron (George Bell and Sons). By the latest school of English poetry we expected Mr. Paley to mean the followers of Mr. Rossetti, or Mr. Swinburne, or Mr. Morris, or even M. Théodore de Banville. But Mr. Paley's "latest school" appears mainly to consist of Mr. Tennyson, Mr. Longfellow, and Mr. Browning, three writers who scarcely seem to belong to the same "school" at all, and who might safely disclaim any connexion with the manner and method of Mr. Swinburne or Mr. Rossetti. On the whole, Mr. Paley dislikes his latest school very much. With Mr. Tennyson especially he seems to have no sympathy at all. Though he carefully "hedges" and disclaims any idea of being disrespectful, it is plain enough that he suspects Mr. Tennyson of being intentionally obscure, the public of buying Mr. Tennyson's poems for the purpose of securing "intellectual," and the reviewers of praising these works because they don't like to be out of the fashion. Now we have no intention of posing as defenders of Mr. Tennyson. There are certainly passages in *In Memoriam* which are deficient in clearness of expression. They are "unclear," as Mr. Paley says, and few can see their meaning at a glance. But we imagine that very few people are like Mr. Paley, who often cannot see the meaning at all.

Mr. Paley is a severe critic. In Scott, who is certainly clear enough, he finds scarcely anything higher than "an accomplished versifier, alike happy in his descriptions of natural scenery and in the narration of stirring events." Mr. Paley might as well describe the "cook" who "edited" the Homeric poems, or the genius who constructed them (he appears to hold both theories at once), as "an accomplished versifier, alike happy in his descriptions of natural scenery and in the narration of stirring events." These merits, combined with Scott's and Homer's power of drawing character and of suggesting reflection, will seem, to more lenient critics, to deserve praise greater than can be assigned either to "cooks," "editors," or "accomplished versifiers."

Mr. Paley finds in Wordsworth the founder of "a new school, not always very lucid in expression, yet full of the deeper thought." His judgment of Lord Byron is interesting, especially when we compare it with the recently published criticism of Mr. Matthew Arnold. "Certainly, Lord Byron has every claim to be taken as the representative of the highest class of English poets for clear thought and expression, harmony of numbers, intensity of pathos, the high polish of his language, and, withal, that perfect *naturalness* which is as far as possible removed from pedantry, affectation, quaintness, mysticism, and from those commonplaces, or even vulgarisms, which we not seldom see thinly disguised under the veil of uncommon diction." Compare Mr. Arnold on "the slovenliness and tunelessness of much of Byron's productions"; on his style, "often so slipshod, slovenly, infelicitous"; on "his most crying faults as a man, his vulgarity, his affectation," which are "akin to the faults of commonness, of want of art, in his workmanship as a poet." What Mr. Paley quotes as "exquisite verses indeed," Mr. Arnold speaks of as "a famous passage beginning

He who hath bent him o'er the dead,

with those trailing relatives, that crying grammatical solecism, that inextricable anacolouthon!" Now, "exquisite" as Mr. Paley finds these lines of Byron's, we venture to think that, if Mr. Tennyson had written them, he would with great difficulty discover their meaning. It is certainly more obscure than most of the obscurest passages of *In Memoriam*. First we have "He who hath bent him o'er the dead." Then we have eighteen lines, in which we vainly look for some more information about him who hath bent him o'er the dead. Then, at length, we learn that the person spoken of "still might doubt the tyrant's power." The anacolouthon is all but inextricable, and this chosen specimen is quite inconsistent with Byron's boasted clearness. It is as "unclear" as it can be. Yet here Mr. Paley finds exquisite art. "The frequent alliterations, like the *ris vidua venti* of the older Latin poets, cannot be the result of mere chance, and, if not, they show a study and finish which is marvellous. Thus we have Day of

Death, Marked the Mild Angelic Air, Rapture of Repose, Tender Traits," and so forth. These are tender traits, indeed. But Mr. Paley, if he thinks of it, must allow that the latest school of English poetry can alliterate with quite as much "study and finish" as Byron. What study and finish, for example, in

Thy skin changes country and colour,  
And shrivels or swells to a snake's.  
Let it brighten and bloat and grow duller,  
We know it, the flames and the flakes.  
Red brands on it smitten and bitten,  
Round skies where a star is a stain;  
And the leaves with thy litanies written,  
Our Lady of Pain.

Here, we may say, like Mr. Paley, here in the lines of the latest school of English poetry the frequent alliteration cannot be the result of mere chance, and, if not, they show a study and finish which is marvellous. Thus we have Country and Colour, Shrivels or Swells to a Snake, Brightens and Bloats, Flames and Flakes, Skies where a Star is a Stain, and here we have no trailing relatives and inextricable anaconda like anacolouthon. If alliteration be a mark of study and finish, the latest school of English poetry can give Byron thirty and a bisque.

As a strong contrast to the new poets whom Mr. Paley cannot understand, he selects this lovely passage:—

See my lips tremble and my eyeballs roll,  
Suck my last breath, and catch my flying soul.

What an invitation! Then Mr. Paley turns for "true melody" to the Pastorals of Pope:—

I know thee, Love, on foreign mountains bred,  
Wolves gave thee suck, and savage tigers fed,  
Thou wert from Ætna's burning entrails torn,  
Got by fierce whirlwinds, and in thunder born.

"Beautiful," says Mr. Paley, "as is the original of this passage in Theocritus, the art of the imitator has perhaps even improved on it." We venture to say that this is a crucial example of Mr. Paley's taste. That fine additional touch about Love being born in Ætna's "burning entrails,"

Got by fierce whirlwinds, and in thunder born,

is precisely an example of the forced and puerile manner of Pope's boyhood, and might be selected as a typical instance of the way in which the classics ought not to be imitated.

In his numerous writings on the Homeric question, Mr. Paley has advanced, as a proof that an early written Iliad is inconceivable, the fact that the readers of *Macmillan's Magazine* are unable to decipher archaic Greek writing. These marks, these characters in the early inscriptions, are clumsy and difficult—this is part of his argument—and therefore could not have been employed in a long written composition. To this it has been replied that characters much more clumsy and difficult are, in point of fact, used in long written compositions. But Mr. Paley is apt to make his own limitations of knowledge the standard of the intelligible. If he finds a character difficult, the people to whom it was familiar must have found it no less perplexing. This mode of reasoning he carries into his discussion of poetry. He takes such a passage as this:—

Likewise the imaginative woe  
That loved to handle spiritual strife  
Inflused the shock through all my life,  
But in the present broke the blow.

"What possible meaning to an ordinary reader can verses like the following convey?" he asks. "We do not pretend to be extraordinary readers, but the meaning is perfectly clear to what De Quincey's brother called 'the most excruciatingly feeble mind.'" The poet means that his habit of reflecting on metaphysical topics, like the immortality of the soul, occupied his mind at the time of his loss, and thus partly deadened the blow, while his grief, associating itself with his habit of speculation, became "diffused through all his life" and a part of his existence. A "woe" that "handles strife" is a clumsy expression, but not particularly obscure. But Mr. Paley determines that because he finds it difficult to understand Mr. Tennyson, therefore "most probably the real object of the author's in composing thousands of verses of this unclear kind was deliberately not to present to the reader any obvious sense, but to set him, as it were, a-thinking, so that he should satisfy himself by thought, and from the very effort and difficulty he experienced in attaining to it, that some very profound truth lies at the bottom of words which only require to be rightly interpreted in order to convey it." Here we find Mr. Paley's prose much more difficult than the Laureate's verse. But it is evident that he is, as usual, raising his own intellectual limitations into a universal standard. And this process leads him to very cynical results. For here, he says in effect, is a poet pretending to be vastly sorry for the death of his friend. But, in reality, this poet is only like Bunthorne in *Patience*. He is only setting himself deliberately to write obscure and imposing nonsense, that the public may say,

If this young man can understand things  
That are certainly not clear enough to me,  
Why what an uncommonly deep young man  
This deep young man must be.

Mr. Paley seems satisfied with this critical theory of the origin of *In Memoriam*. Then why is *In Memoriam* a poem so widely read, and by many persons regarded almost as a sacred treasure of consoling music? Mr. Paley's theory of that, too, is a little cynical. "Shall we say," he observes, speaking in general of the

poetry which he cannot understand—"shall we say that very many who have no real heartfelt love for poetry like to be thought clever, and so prefer sentiments which lie a little way or a long way below the surface?" Then he asks, with real and touching perplexity, "How can Love be the 'strong son of God'?" And he admits that, as he passed through life asking this question, "More than once I have received a reply not very far removed from the retort, 'You must be very stupid.'" And, if Mr. Paley cannot understand that love may be strong to harm, as the shepherd knew who was thrown a fall "ἔρως ἵπ' ἀργαλίῳ, or strong to save, he certainly must be credited with no remarkable clearness of critical vision.

To be brief, Mr. Paley may assure himself that Mr. Tennyson is read, not because of his faults, but in spite of them; not because his expression is occasionally confused, nor because people "like to be thought intellectual," but because his verse is full of beauty and charm, which Mr. Paley is unfortunate enough to be incapable of appreciating. He may content himself with admiring

See my lips tremble and my eyelids roll,  
Suck my last breath and catch my flying soul.

There is plenty of poetry like that, plenty of poetry for all tastes; and, as Mr. Paley says, the greatest rubbish ever penned will not want eulogy if it bears on its title-page a well-known name. Bad grammar and bombast will please at least one critic, if recommended by names like those of Byron and Pope.

#### THE ARCHÆOLOGICAL INSTITUTE AT BEDFORD.

AN Archæological Congress used to differ, if not ostensibly yet really, from an ordinary antiquarian meeting at home in the fact, tacitly but effectually acknowledged, that the gathering was intended to unite picnics and science. Naturally these picnics were sometimes of a very elaborate character. You did not sit with a plate on your knee and your tumbler in your pocket. One noble president actually roofed over the great hall of a castle unroofed by Cromwell, and another carpeted a cloister which had not boasted of even a pavement since the days of Cromwell's great-grand-uncle, and all to give archæologists a single feast. No doubt such meetings, in fine weather, were extremely pleasant, except for people who looked upon them as waste of time, and considered the feasts an obtaining of hospitality under false pretences. We cannot undertake to answer for other Societies, but a spirit of austerity has crept over the Royal Institute. During the last annual meeting some members even complained that, while their minds were being informed, their bodies suffered extremities of hunger; and it was credibly reported that the managers of excursions recommended the votaries of ancient lore to carry biscuits with their note-books, as luncheon might be hurried or even omitted, and nothing would be provided but the bare necessities of life. A new resolution was even framed and promulgated by the Council, in which it was laid down as contrary to the rules of the Society to accept any hospitality but that offered on opening days by corporations or presidents at the chief place of meeting. And if we glance at the very full programme of the proceedings for the Bedford Congress now being held, we shall see that this stern regulation is very strictly enforced. If Mr. Hartshorne does not find a serious diminution in the attendance of that section of the Society's supporters who used to be looked upon to pay the expenses by the number of their temporary tickets, he must be congratulated on the result of his policy. Good work is being done, and will be done, even though only ten minutes or a quarter of an hour is allowed for the midday rest and refreshment. To take a single day from the present programme, we find that the Institute proposes on Monday next to leave Bedford at ten for Elstow Church and Moot Hall, arriving at a quarter-past; thence at eleven for Loughton Conquest Church, arriving at half-past, and leaving again at noon for a twenty minutes' drive to the ruins, and thence to Ampthill, which will be reached in time for luncheon at the inn at half-past one, an hour only being allowed for delay, during which refreshment must be combined with the sights of the place. At half-past two a start is to be made for the drive to Cainhoe Castle; and the return, by Wurst Park to Bedford, will occupy the remainder of the afternoon. This is by no means the hardest day's work mapped out, and the evening concludes with a meeting in the Bedford Rooms, the headquarters of the Institute. Several of the previous days have been equally laborious. As an example we may select Wednesday, when the Dunstable excursion took place.

A more pleasant day, both as to weather and as to sights, than Wednesday it would be difficult to imagine. It was not too hot. There was no dust and only one shower. Great clouds swept in shadows across the brown bare Chilterns, bringing out the features of the landscape as they passed. The view from the heights between Eddlesborough and Dunstable was especially fine; the great "borough," with the square-towered church on its summit, appearing now brilliantly lighted against a deep blue background, stretching away to a horizon of hedgerows, and now dark and frowning against an endless view of smiling cornfields and sunny pastures. But the archæologists were not allowed at Eddlesborough or elsewhere to waste time in admiring the beauties of nature. A mere enumeration of the places visited will show that nothing but careful organization and an unflinching but good-humoured despotism enable Mr. Hartshorne to conduct his party

safely to Luton to catch a train in time for dinner and "sections" at Bedford. Arriving at Leighton Beaudebert, or "Buzzard," soon after ten, they inspected the church, which forms so conspicuous an object with its tall spire from the London and North-Western line. Here the fine sedilia in the choir, the noble proportions of the whole building within, and the delicate "entasis" of the central spire without, having, with some quaint tablets and epitaphs, been duly admired, the party started for a long drive up hill and down dale to Stewkley, which lies nearly due north from Leighton, across the border of Buckinghamshire. It is rare to see a church so wholly Norman as that of Stewkley, with its vaulted chancel, its flat-roofed nave, its plastered walls, and the many features which induce Mr. Hartshorne in his *Notes* to compare it with Ilfley, both being churches given to Kenilworth Priory in 1170. From Stewkley over the hills to Wing was half an hour's delightful drive through a densely populated district of straw-plaiters, living, in great part, in half-timbered houses of remarkable beauty. Wing has, in many respects, the most interesting church in Buckinghamshire. A considerable part of it presents a good example of an ordinary Perpendicular parish church; but the chancel, which rises by several steps, is, at first sight, a semicircular apse. On examination, however, particularly of the exterior, it proves to be polygonal, and of a type anterior to what we generally reckon as Norman. Even the nave, in its foundations at least, is of similarly early work; and, though "we have here none of the usually acknowledged distinctive Anglo-Saxon features," yet, from the character of the nave piers, the rude style of the crypt on which the chancel is elevated, and other points too numerous to mention in a summary notice, it is plain that, old as the chancel is, a still older church stood here—a church so old that one competent authority does not hesitate to ascribe it to the time of Alfred, the chancel being assigned to Canute. Be this as it may, Wing Church, apart from the interesting monuments it contains, might well have delayed the party all day instead of three-quarters of an hour. These monuments are chiefly of the Dormer family, from whom their heir, Philip Dormer Stanhope, Earl of Chesterfield, derived his second name. There are two sumptuous tombs in the chancel, of the best type of the Elizabethan renaissance, and one in the north aisle which, for well-contrasted simplicity and ornament, and a certain dignity and what artists term "largeness," is a wonderful work to bear such a date as 1552. The archæologists paid perhaps undue attention to a little brass dated 1648, in the south aisle, which commemorates an obscure worthy as follows:

Honest old Thomas Cotes that sometime was  
Porter at Ascott Hall, hath now (alas)  
Left his key, lodg, fyre, friends, and all to have  
A room in Heaven. This is that good man's grave.  
Reader, prepare for thine, for none can tell  
But that you two may meete to-night. Farewell.

From Wing, after a lovely drive, first past numerous barrows on an open down, and then by roads which skirted the park of the palatial Montmore, the party arrived at Eddlesborough, where a plain luncheon was served in an inn parlour, long and low. The church, chiefly remarkable for its situation, and an ancient barn, seemingly of endless length, occupied the party for half an hour, during which a heavy shower fell; and then the archæologists descended to Eaton Bray, where the church, although in a semi-ruinous condition, and actually under repair, is of the highest interest as a complete example of the Early English period. The beautiful capitals of the columns in the nave, and the curious and rare arrangement in the side aisle of "strainers and counter-strainers"; the beautiful, but simple, old stone reredos, which still exists in the Lady Chapel; and, above all, the magnificent ironwork of the south door, so like the work of the local artist John of Leighton, whose *chef-d'œuvre* is in Westminster Abbey—all these things, and many more, were seen and duly admired; and then, crossing an elevated ridge of the chalk hills, the party reached Dunstable.

Here a somewhat longer delay was arranged for on account of the importance of the place in history, and because the architectural remains of the famous priory church are so remarkable and so little visited. Founded by Henry I. towards the end of his reign, the priory—locally, of course, called the Abbey—presents a very perfect example of the best period of the Norman style, without the crudeness of the earlier or the excessive ornament of the later examples. Mr. Hartshorne, in his excellent *Notes*, expresses his opinion that the Church of Dunstable dates before 1150 but after 1131, the date of the charter. As originally constructed, it seems to have been cruciform. The nave, which is all that remains, has undergone extensive reparation at the hands of Mr. Somers Clarke, who has contrived to prop up and strengthen a falling building without the sacrifice of its appearance of antiquity. The monuments, some of which are very curious, have been left in their places, and even the pulpit cloth, "given by two sisters, named Carte and Ashton," in 1730, has been carefully preserved, "a good example of a bad style." The same faults of construction or, perhaps, of material which rendered Mr. Clarke's reparation necessary, seem to have existed from the first. This is apparent from the view of the west front as we approach it from the town. A tower is attached to the north-west angle, and a similar tower stood at the opposite side, with a kind of screen between them. Both towers fell down in 1221, according to the Chronicle of Dunstable, one upon the Prior's hall,

crushing the greater part of it; "altern vero cecidit super ecclesiam et locum in quo cecidit conquassavit." The squashed place, to translate literally, was probably the north aisle, from which traces of Norman work are almost absent. There are many other notices in the Chronicle of the buildings, their fall and reparation. The Totternhoe stone employed seems to have been chiefly responsible for these accidents. At present the western front, though by no means large, forms one of the most picturesque groups of the kind in England. Britton and Brayley noticed this as early as the beginning of the present century. The west front, they say, "has been considered as 'one of our great national curiosities,' from its singular intermixture of circular and pointed arches, and the curious manner in which its ornaments are arranged." The Royal founder gave the manor to the Priory, and perhaps on this account part of the church belonged to the parish. To this fact the preservation of the nave may be attributed. The last prior was Gervase Markham, who had taken an active part with Cranmer against Katharine of Arragon. Here, in the Lady Chapel, the sentence of divorce was pronounced by the Archbishop in 1533; and at the dissolution the complaisant Prior had his reward in a pension of sixty pounds a year for life. The usual disagreements between the town and the lord of the manor, of which we hear so much at Bury St. Edmunds and St. Albans, were not less frequent here, and on one occasion the whole unfortunate population of overtaxed burgesses threatened to desert in a body and build themselves another town without the borders of the Prior's estate. This was in 1229; but shortly a compromise was arranged, through the intervention of the Archdeacon of Bedford, and the Prior renounced his rights to tollage in consideration of a large sum of money. There was, besides the church, a fragment of the conventual buildings to be seen. It is situated at some distance, abutting upon the street, the intervening space, now a garden, having been covered by the Prior's house and other domestic features common to such monasteries. The surviving fragment consists of a low groined hall of five bays, over which a modern house has been built. To this circumstance it owes its preservation. It can never have formed a very important part of the Priory, having probably been the *hospitium*, and the tradition is certainly wrong which asserts that the body of Queen Eleanor rested in it on the way to Westminster. The church would, of course, be selected for the purpose, though the procession may have passed through this building on its way. From Dunstable Church to the railway station is but a step, and so ended a memorable day in the annals of the Institute.

#### BRIGANDS.

DR. JOHNSON'S definition of a brigand as "a robber, one that belongs to a band of robbers," scarcely covers the whole of the ground according to the modern conception. The term brigand is now restricted to those who capture persons of presumed wealth and influence and hold them to ransom. The practice is a very ancient one, and has not always been regarded with the aversion with which it inspires most people in the present day; indeed, it was looked upon in former times as rather an honourable profession than otherwise, and was an especially favourite one with kings, feudal lords, and knights-errant in the middle ages. The captivity of our own King Richard in Austria cost him so heavy a ransom that, as *Davies on Ireland* tells us, he was thereby "hindered to pursue" the conquest of that country, which probably saved him a great deal of trouble. The Turkomans are perhaps the most incorrigible brigands in existence, for with them man-stealing is not merely the vocation of a few bolder spirits, it is the national industry of the race. But Greeks, Turks, Spaniards, and Italians produce the most systematic and well-organized bands, the members of which, instead of "fooling around" after stray travellers, or making raids into neighbouring districts, make things all comfortable in their own neighbourhood, and content themselves with an occasional captive, of whose ability to pay they have previously convinced themselves. The Greek brigands enjoy exceptional advantages. They generally work on or near the frontiers, so that the Greek and the Turkish Governments can mutually and with virtuous indignation repudiate responsibility in their acts; at the same time they are always on good terms at or near headquarters in both countries; for the pet nationality and the pet abomination of the Liberal party both possess people in their service who are more than suspected of bearing "an itching palm," and neither Athens nor Constantinople is too Arcadian in the point of official simplicity and honesty. It may be an exaggeration to suggest, as M. Edmond About does in his inimitable *Roi des Montagnes*, that joint-stock companies are formed for "exploiting" the brigand capabilities of the country, with agents and directors amongst the higher classes in the capital; but it is certain that the brigands receive both information and aid from thence, and are able at times to make excellent *coups*. The case of Colonel Synges is fresh in our readers' memory; and the manner in which his capture and the negotiations for his release were effected is highly creditable to all concerned.

Great tact and judgment are required both in effecting a raid or capture, and in arranging for payment of the ransom. The brigands should by no means be too hasty in forwarding ears, noses, or other portions of their captives, even when the inevitable bargaining about terms drags rather slowly on. They should also remember that a deceased captive is worth absolutely nothing at all, and

that shooting or hanging is only to be used as a last resort. On the other hand, the friends of the captive must neither be unduly anxious to come to terms, nor too dilatory in making an offer; and, above all, they must be very careful to keep the military and civil authorities from interfering in the matter. Neglect of these simple precautions often leads to deplorable results for both sides. The terrible massacre of an English and an Italian Secretary of Legation, and of two English gentlemen besides, by the band of brigands headed by the brothers Arvanitaki was a case in point. The brigands had received notice of the intended arrival of a large party of Cook's tourists on the field of Marathon at a certain day, but fate threw the party from the Legation into their hands instead. Lord Muncaster, one of the captives, was allowed to depart, in order to arrange for payment of the ransom, but owing to the bungling of the Greek authorities, and notably of a Colonel Theagenes, the soldiers followed the brigands, who at once stopped and shot Mr. Herbert and Mr. Lloyd, while Mr. Vyner and Count Boyl were taken on to Skimetri, and put to death. The soldiers, becoming infuriated, attacked the brigands, killing six, and taking two alive. Most of the rest were afterwards caught, tried, and executed at Athens, on which occasion so much popular feeling was exhibited, that the severed heads of the criminals were seized by the mob, and kicked about the market-place. The greatest indignation was expressed by the English Government, not only at the political corruption which made the brigandage possible, but at the blundering manner in which the affair had been conducted by the Greek authorities, which had led to such tragic results. The brigand trade is very brisk just now. On June 23 a Greek captain, owner of a brig anchored off Mount Olympus, went on shore about a mile from a landing-place where there is a guard of soldiers, and was carried off by a band of brigands. They ask 2,000*l.* as ransom, which we are incidentally told he cannot pay. A Turkish official was also captured some fifteen miles higher up the Gulf, and no news has been heard of him since. An Englishman in Spain, Mr. Lester, who was also taken prisoner, was more fortunate, for being left alone for a short time he actually gnawed his bonds asunder, and made good his escape.

But, even when all is satisfactorily settled, the brigands have by no means so much the best of it as might be supposed. According to the old plan, when a British subject was captured, his friends paid the money, or, if they had not the means, the Home Government advanced it for them, and the bill was sent in to the Greek or Turkish Government as the case might be. This again was cheerily paid; and the little outlay was recovered from the district in which the outrage took place. Here there seems to be some injustice. Some people have a theory that, if the inhabitants of a district choose to make it too hot to hold brigands, there would be no brigands there at all. Now your ordinary Greek, Turkish, Spanish, or Italian peasant does not trouble himself about his neighbour's business, and if the said neighbour spends his money freely, and is a good fellow and a good shot into the bargain, it is obviously not to his interest to interfere with such a neighbour's avocations. What does it matter to him that the Government has had to pay some few thousand *lire*? So much the better for trade if it has found its way into his district. But when he begins to discover that the Government is bent upon recovering these *lire* from himself, an unwilling agriculturist, and that every *coup* which his gallant friend makes costs him personally a large sum of money, he gradually awakes to the fact that it is, after all, he himself who is robbed, and he makes his neighbour's life such a burden to him that he is glad to seek for more propitious fields of enterprise. Now this is hard upon the brigand who has been promised an amnesty and the peaceable enjoyment of his spoil, but finds himself hunted down by a worse foe than his natural ones the gendarmerie. He has obviously been unjustly treated, and he has no redress. That is to say, he has hitherto had none; but the present British Government have just promulgated a measure which will remove the injustice, at any rate in the case of any of our fellow-subjects who may come within the operations of the brigand industry.

Lord Granville has this week addressed a circular to Her Majesty's diplomatic and consular agents abroad, informing them of the decision of Her Majesty's Government to make no pecuniary advances in future to ransom British subjects when in no public character in the event of their being captured by brigands. In this he informs all whom it may concern that the "Two recent cases of brigandage in European Turkey, which led to the capture of Colonel Synges and Mr. Suter, and their subsequent release on payment to the brigands of heavy ransoms advanced by Her Majesty's Government, have forced Her Majesty's Government to consider the principles which should govern their conduct in similar cases in future, and they have come to the conclusion that where British subjects are captured by brigands, when in no public character, but in pursuit of their own pleasure or business, no advance whatever for the purposes of ransom should, under any circumstances, be made from the British Exchequer." Henceforth "British subjects who may be residing, or who may hereafter take up their abode, in any of the provinces of Turkey where brigandage prevails, do so at their own risk, and the Government not only will not undertake to make pecuniary advances to ransom them from the hands of brigands in the event of their being captured, but will not take any measures to relieve them from the dangers they may incur from a residence in Turkish territory. It is also expressly stated that the principle thus laid down applies to British subjects not only in the Ottoman Empire but in other countries.

This is as it should be; the brigand now knows that he has a fair field and no favour so far as British subjects are concerned, and will, if he is wise, be careful to ascertain the nationality of his intended captures before proceeding to extremities, for it would be awkward for him if he lit upon a subject of Germany and France or any other Power which does "undertake to relieve its subjects from the dangers they may incur from residence in the Turkish territory."

The additional clause which includes other countries as well as the Ottoman Empire in the edict, though obviously an afterthought, is very properly inserted. It would have been against the principles of the Government to sanction a kind of foreign bounty on Greek brigandage alone; but, by according the same privilege to the marauding interests in other countries, a sort of free-trade right is extended to the latter. No doubt, also, the resolution was a wise one to come to from financial reasons, since a possible advance for the purpose of rescuing an Englishman from captivity or death would most likely have to appear on the Liberal Government's Budget, whereas the reimbursements by the foreign Government might very likely figure on that of their successors; and we know that the frugal economy of the Liberal party is one of its greatest claims upon the love and admiration of the people. What British subjects in the Ottoman Empire and elsewhere will think of a Government which, recognizing the existence of a great danger, and having in its hands a powerful means of averting it, deliberately abandons them to it without hope of aid or redress, rather than advance a few thousand pounds, we do not pretend to say.

The Consular service is sufficiently costly, but it is well organized, and the Consuls are for the most part efficient and experienced men, able and willing to afford advice and protection to their fellow-subjects. Why they should be officially told not to relieve travellers and others from the dangers incident to residence in Turkish or other territory it is difficult to see, unless, indeed, it be that they are to devote their time and attention exclusively to commercial interests, for which, no doubt, the wealthy manufacturers will show their gratitude in the event of another general election. We have been accustomed to abrupt changes in our foreign policy, and we are growing used to the lowering of English prestige, especially in the East; but to leave Englishmen at the mercy of marauding and murderous scoundrels, and to tell them that they must expect no help at all, if they are so imprudent as to reside or travel abroad "for their own business or pleasure," is a new departure for which, we must confess, we were not prepared. The insertion of the passage last quoted is, of course, a concession to the old prejudice that ambassadorial persons are to be considered sacred; but we do not know how soon even this relic of international political superstition may not be swept away. In the meantime, let us be thankful that we have not fallen into the hands of brigands.

#### WOLVES IN FRANCE.

ONE of the few remaining institutions of the *ancien régime* is, in all probability, about to disappear from the soil of France. Ever since the establishment of the Republic there have been increasing complaints of the inefficiency with which the *louveteurs* discharge their nominal duty of extirpating the wolves, and the immense extension of private property has made their interference with the rights of individuals seem unconstitutional and intolerable. A Commission appointed by the Chamber to inquire into the whole question has just presented its Report, which either incorporates or supercedes reports presented by previous Commissions, and we may expect to see a law brought in in accordance with the recommendations it has laid down. The Report calculates the number of wolves actually contained within the French frontiers at five thousand, and the amount of damage inflicted by them on the farming class at no less than forty or fifty millions of francs per annum. These numbers are not, of course, to be compared to those of the middle ages, or even to those of a century ago. In 1798 no less than 6,487 wolves were killed in the twelvemonth, and a memorial of one Arnould du Buisson, presented in 1779, estimates the number of sheep annually devoured by wolves at a million at least, without reckoning the cows, horses, mules, asses, and goats which they had likewise disposed of. It must be remembered, however, that at present the wolves are in the main concentrated in a few districts, especially in Lorraine, Dauphiné, and the Pyrenees, so that the mischief done by them is not spread over the whole of France. Their ravages in both French and German Lorraine were very serious in the past severe winter, and the German authorities were obliged to lay a heavy price on their heads in order to abate the evil. The principle of these *primes* is, indeed, the obvious one for dealing with the matter. It rid us of the wolves in England; it was adopted by the revolutionary Government in 1793 (though its efficiency was considerably marred by the fact that the high sums promised were paid in depreciated assignats), and it will doubtless clear them out of France in the course of a generation. With the adoption of this system will go the total abolition of *louveterie*, and this is an institution which has so curious a record, and one in several respects so instructive to the historical student, that we make no apology for going into the matter a little more fully.

To begin at the beginning, when Charlemagne organized the

Empire, he left to each "intendant" his preserves, with the condition that they should appoint two *louveteurs* in each district. With the disappearance of the Empire these, too, disappeared, and we do not again meet with the institution of *louveterie* till the reign of Charles VI. This does not mean that it was not in existence again before this reign, for the ordinance of Charles VI. referring to it not only proves its existence, but shows that it was strong enough at the time to be exceedingly mischievous. The King wanted money for his daughter's dowry, and by way of conciliating his faithful Commons issued an edict in 1395 to put a stop to all commissions given for the taking and slaying of wolves. It was the practice of the *louveteurs* to quarter themselves upon the unfortunate villagers, whose lives and property they were supposed to be protecting against the wolves, without going through the formality of paying either for the lodging or the eating and drinking of themselves and their numerous retainers. A bitter complaint of the "Etats" in 1560 shows how ineffectual had been Charles's ordinance. In this curious document the forced entertainment of the *louveteurs* is described as an intolerable grievance. The chase of wolves as of other animals was in fact absolutely forbidden to any but the nobles; Charles VI. himself issued a stringent ordinance to this effect in 1396, and after his reign the title of *louveteur* was regularly sold, of course only to members of the nobility—an arrangement which naturally did not lighten the burden, as the buyers took very good care to recoup themselves out of the pockets of the peasantry. By an ordinance of 1538 the *prime* to be paid to the *louveteur* for every wolf was fixed at two "deniers Parisis" for every hearth within a radius of two leagues from the spot where the wolf was killed. After the Twenty Years' War the ravages committed by the wolves were incredibly extensive. Human beings, even armed men, were frequently attacked, and it was no uncommon sight to see a half-eaten body on a country road. Henry III., in 1583, without absolutely abolishing *louveterie*, called upon the *grands maîtres* and their lieutenants to organize battues against the wolves. In 1601 he further invited the great proprietors to do the same on their own lands. The only consequence was a conflict of authority between *louveteurs*, *grands maîtres*, and proprietors, the chief sufferers from which were of course not the wolves, but the country people. The *louveteurs* were, however, still extremely unpopular, partly from their exactions for lodging and entertainment, partly from the high *primes* they demanded, and partly from the arbitrary manner in which they forced the peasants to join them, without payment, in a battue. A decree of 1608 fixed the *prime* to be paid, and another of 1677 forbade them to requisition any one for a battue without the consent of two gentlemen, to be named by the intendant of the province. These interferences discouraged the *louveteurs*, and at the end of the seventeenth century several provinces had the good fortune to be altogether without them. Where they existed during the eighteenth century, there was an almost perpetual conflict of authority between them and the *grands maîtres*, in which they were now supported, now abandoned, according as the *grand louveteur*, a magnificent Court functionary who came into being under Francis I., was in favour or otherwise with the King. In 1775 Louis XVI. determined to put an end to the conflict. He restored to the *louveteurs* their monopoly of wolf-hunting, but at the same time abolished the system of *primes*, which had been so abused, and compensated them by the concession of several valuable immunities. The advent of the Revolution put an end to *louveterie* for the time being. Every proprietor was allowed the right of the chase on his own land, and the wolves would have been speedily exterminated if the forests belonging to the State had not been exempted from the operation of the law. Wolf-hunting was further encouraged by very liberal *primes*, as much as 300 francs being offered for a she-wolf with young, 200 francs for a male, and 100 for a cub. These payments were, however, made in depreciated assignats, and, as a Message of the Directory in the year 1797 very naively acknowledges, were actually worth not more than 24, 16, and 8 francs respectively. The Message opens thus, in a passage which, while indicating the ravages of the wolves, is a curious example of the pomposity of style which characterized the most ordinary official documents issued by the Revolutionary Government:—

The warfare carried on by the French Republic against the enemies who threaten her freedom has not been directed against the most formidable enemy of her domestic animals, the wolf, which has not only had full liberty to increase and multiply, but has even been driven into the interior of the country. The ravages committed by this animal have been such that all local bodies have been complaining to Government. It is not against sheep alone, that species whose increase it is so important to encourage, that the wolf wages war; calves, foals, mules, cows, even bulls, have fallen victims to it; and a disastrous experience has taught us that even the human species, especially women and children, have become its prey, and that in fact their flesh, once tasted, is even preferred by the wolf to every other.

The message goes on to substitute *primes* of 60, 40, and 20 francs, to be paid in cash, for the extravagant but illusory offers already mentioned. On one point all the real Revolutionary Governments were staunch—they would not permit the reintroduction of *louveterie*. Several applications to the Government from country gentlemen for the post of *louveteur* are on record, and to all is appended a categorical refusal. Napoleon, however, whose object was to have a Court which should eclipse the glories of the old *régime*, naturally revived the institution of *louveterie*, and a decree was issued organizing it with great splendour and elaboration in 1805. It was maintained under the Restoration, and has lasted down to our own days in a more or less mutilated and fragmentary con-

dition. Of late years the *louveter*, however, has approximated more and more to the ordinary English fox-hunter. The object has been to hunt the wolves, not to exterminate them; and it is whispered that by ardent sportsmen the wolves are regularly preserved, and that no true *louveter* would think of killing a she-wolf with young. But when the institution is simply kept up for the sake of the sport and the fine uniform which the *louveter*s have the right to wear, it is obvious that it ceases to justify its existence in a democratic country like France. The Commission urges its entire abolition, and their recommendations will doubtless be carried out.

The arrangements proposed by the Commission to take the place of *louveterie* may be briefly dismissed. In the first place, every proprietor of woods is responsible for damage done to his neighbours' crops by animals coming off his land. He can, however, "disengage his responsibility" by promising either to take any measures himself against wolves and boars which may be ordered by the local authorities, or by allowing them to enter his woods and conduct a battue on their own account. Both proprietors and others are to be encouraged to kill the wolves by *primes* of 150 francs for a she-wolf with young, 100 francs for a male, 40 francs for a cub, and 250 francs for any wolf that can be proved to have attacked human beings. Those sums are to be paid by Government. In very exceptional circumstances, as when a wolf has been seen in the act of devastation, and it is necessary to pursue him at once, the village mayor can organize a battue, and requisition trackers if he has not a sufficient number of volunteers. But he must only requisition those whose land is in the neighbourhood of the spot where the wolf was seen, and who are, therefore, directly interested in its destruction, and, if the wolf is caught, they must be paid a day's wages out of the *prime*. The wolves have a bad time before them, and in another generation we shall probably hear of the last wolf killed on French soil, an animal which will doubtless become as traditional as the last wolf killed in Scotland by Sir Ewen Cameron of Lochiel towards the end of the seventeenth century has already done.

#### THE FALL ON THE LONDON, PARIS, AND NEW YORK STOCK EXCHANGES.

THE past few weeks have witnessed a heavy fall on the Stock Exchanges of London, Paris, and New York. The fall has been less serious and less general in London than in the other two cities; indeed, most purely British securities—as, for example, Home Railways, Consols, Indian and Colonial Government Securities—have risen rather than fallen, the reason being, no doubt, that the depression here in London is rather the reflex action of the fall in Paris and New York than the result of purely London causes. But to some extent the causes of the fall are operating in all three cities, though they are most active in Paris and New York. These causes are overwrought speculation, political anxieties, and the approach of the holiday season. At the setting in of the holiday season it is usual to have a slackening of business, more particularly on the Stock Exchange. People who are about to take a holiday do not wish to go away while engagements are open which may be rendered disastrous by accidents over which they have no control. They usually, therefore, close their transactions, and the closing of bargains, in other words general selling, leads to a fall of prices. In the present year this selling has been more general and on a larger scale than usual, and it has begun earlier because speculators on the Stock Exchange have made a great deal of money during the past twelve months, and, the weather being so very fine, have desired to enjoy themselves in foreign travel. But the mere setting-in of the holidays, though it would have caused a slackness of business, would not have brought about the fall in prices which we witness, were it not assisted by other and more serious causes. These, as we have said, are political anxieties and over-speculation.

The great revival of prosperity in the United States has been attended by an extraordinary speculation. The growth of population and the revival of trade have made railways prosperous which for years before had never paid a dividend, and have enabled the dividend-paying lines to declare much larger dividends than they had previously declared. In consequence there has been a great rise of prices, which to a very large extent has been fully justified. But, as always happens in such cases, the rise has not been confined to the railways and other industrial enterprises whose success at least partially warrants it; it has extended to lines which have never earned their expenses, and are not likely soon to do so. As a matter of course inflated prices and the wild speculation which originated them created a great demand for loans and brought about high rates of interest. Speculators, many of whom had not the means, and none of whom had the intention, of paying for the stock they bought, were enabled to carry on their operations only by means of credit. Gradually, therefore, the interest charged for actual loans and for postponing payment for the stocks purchased rose until it became so large as to eat away the expected profit of the transaction. The speculators grew anxious as those high rates continued, and were prepared to sell should any adverse circumstance occur. It was clear to them, in fact, that they could realize the profits they hoped for only by an extraordinary combination of favourable circumstances which they could hardly hope for, and were unfavourable circumstances to occur, their chance of profit would disappear. When the holiday season approached,

they grew still more anxious, and the declaration of the dividends of many of the lines has proved less satisfactory than they had anticipated. During the first three months of the year the weather had been exceptionally severe in the North and North-West of the United States. Traffic had in some cases been entirely suspended for weeks together, and in other places was carried on only under the most adverse conditions. The earnings, therefore, fell off, while the expenses were enormously increased, and the bad weather continued so long that the canals were able to compete with the railways for the carriage of grain when the floods and storms abated. During the second quarter of the year the traffic was large, the weather beautiful, and trade most prosperous. The earnings of the lines then grew very much, and in some districts of the country enormously exceeded the earnings of last year; but, as we have said, in large and important districts, the expenses had been so great in the first three months as to eat away the larger part of the profits. The unsatisfactory dividends, therefore, acted adversely to the speculators, and their influence was exaggerated by the competition which the canals carried on against the railways for the carriage of grain. The great trunk lines, which unite the Atlantic ports with Chicago and St. Louis, are able to charge remunerative rates for grain only by an arrangement among themselves, in accordance with which a Commissioner appointed by them fixes the rates which all the lines are bound to charge. During the winter, when the canals are frozen over, the railways have the whole trade in their hands, and the rates so fixed are usually well observed; but when the fine weather sets in and the frost disappears the competition of the lakes with some of the lines becomes very severe, and these very often, to attract traffic to themselves, agree privately to take grain at rates below those fixed by the Commissioner. This is what was done this year, and in consequence the Commissioner has had to reduce the rates from 30 cents per 100 lbs. first to 25 cents and then to 20 cents—a reduction of fully 33 per cent. It is said that some of the lines are now carrying at still lower figures. As soon as it became known that "cutting" of rates was going on, the prices of railway shares fell heavily, and something like a panic occurred in certain stocks. While the market was under the influence of these various adverse causes came the attempt upon the life of the President, superadding political anxieties, and the fall immediately became more severe, nor has the market yet recovered.

In France the causes were somewhat different. There the speculation had been wilder and less warrantable than in New York. In the United States, as we have said, there was real prosperity to justify high prices; whereas in France trade is not good, and agriculture is depressed. The country, in fact, is suffering from phylloxera, bad harvests, and two out of four bad beet-root and silk crops. Yet the rise of prices there has been, if possible, even greater than in New York, and in consequence the rates charged for money upon the Stock Exchange have been heavier—6, 8, 10, and even 12 per cent. having become common rates of interest, rendering it impossible for the speculators to hope for a successful issue from their speculations, except under some marvellously favourable combination of circumstances. At last bankers would seem to have become alarmed at the magnitude of the speculation which they had so long supported, and they are understood to have applied pressure to compel the weaker speculators to close their accounts. While the market was thus sensitive the French Government embarked on the unwise Tunisian expedition, and instantly Paris was filled with apprehensions as to what might occur. Italy was alienated, England was offended, and Spain made suspicious; while there were fears that Prince Bismarck might be at the bottom of the whole business, and might be preparing a trap in which to catch France. Prudent people began to think that it would be wise to close their engagements while it was yet time; and, when they began to sell, prices of course fell. Others grew alarmed, and rushed in to dispose of their stocks while they could yet get rid of them without ruinous losses. The mistake committed in withdrawing the troops from Tunis before order was established there increased apprehensions, and further unsettled the market. The uneasiness has still further been added to by the Italian Loan. The Messrs. Rothschild have hitherto brought out all the Italian Loans, and to the Messrs. Rothschild, in the first place, the Italian Government applied to launch their new loan. But the Messrs. Rothschild were aware that an Italian Loan could not possibly be placed in Paris while the relations between France and Italy were so strained as they are at present, and they recommended that the loan should be postponed until the autumn. The Italian Government, anxious to prove to the world that they are financially independent of France, refused; and they made an arrangement with a syndicate of which Messrs. Baring and Hambro' are the head. But the great financial houses of Paris were as little willing to allow it to be proved that Italy is independent of the Paris money market as the Italian Government was anxious to prove to the world that it is so; and the measures taken in Paris to defeat the Italian loan have still further added to the depression on the Stock Exchange.

Here in London political apprehensions have had less influence than abroad, and speculation has not been so much overdone. Still, there has been over-speculation, and especially in June the rates charged to speculators were very heavy. But the chief cause of the fall here has been the fall in Paris and New York, and the desire of speculators to close their accounts before taking their holidays. In reality, the London market is firm, notwith-

standing appearances to the contrary. It is depressed mainly by the depression of Paris and New York. Were either of these to recover, it would soon again become animated. The speculation here, though considerable, has never been really dangerous, and the rates charged have to a large extent been factitious. There have consequently been no heavy losses, except in a few instances, and speculators are ready to renew the speculation the instant it can be seen that Paris and New York are prepared to second them. It would seem, therefore, from what we have said, that the fall in prices we are now witnessing is a mere check in the speculative movement which has been going on for the past two years. The fall that has occurred has compelled weak speculators to sell out, and has put stocks into the hands of capitalists who are strong enough to hold them until a further rise comes, and whose interest, therefore, it is that the rise should come. The political apprehensions in America will certainly pass away. Even in the worst event a change of Government will introduce no serious change of policy, and things in a few weeks will go on just as they went before. In Paris, too, the political apprehensions will pass away if peace is preserved, and the financial difficulties would seem also to be in process of arrangement. The weaker speculators are being rapidly weeded out, and when they are gone it will be in the interest of those who have bought at the lower prices to see the stocks again raised, so as to sell with a profit. We expect, therefore, to see, as soon as the holiday season is over, a renewal of the speculation which has been going on for the past two years. The prosperity of the United States is too great at present to allow of any permanent stoppage of the speculation, and here in Europe we seem at last to have a fair prospect of good harvests and better trade. With these there will be larger profits for the railways and for all industrial enterprises, and with larger profits, and consequently larger dividends, there will be a justification for higher prices. Money, too, is exceedingly cheap, and promises to remain so for some time; and with cheap money speculation is an inevitable concomitant where credit is as good as it is at present.

## REVIEWS.

### SULLY ON ILLUSIONS.\*

IT is by a somewhat liberal extension of the category of science that the subject taken in hand by Mr. James Sully may be thought entitled to admission into the "International Scientific Series." From the common-sense point of view, at all events, illusion would seem to be something too abnormal for reduction to scientific rule, or, at best, to fall under the domain of the alienist or mental pathologist, being as distinct from the philosophy of mind as the study of morbid anatomy or of specific bodily disease is from the science of physiology. So far, however, from this being an exact or exhaustive view of the nature or the claims of illusion, illusion is, Mr. Sully pleads, too common a phenomenon of ordinary or normal life to be excluded from the ken of the scientific biologist, still less to be handed over to those concerned with the mentally insane. There are few men who are not at times subject to illusion. Hardly anybody is at all times consistently sober and rational in his perceptions and beliefs. "A momentary fatigue of the nerves, a little mental excitement, a relaxation of the attention by which we continually take our bearings with respect to the real world about us, will produce just the same kind of confusion of reality and phantasm which we observe in the insane." And, if thus illusion has its roots in ordinary mental life, the study of it must belong to the physiology as much as to the pathology of mind. Our author would even go further, and say that in the analysis and exploration of illusion the psychologist may be expected to do more than the physician. If to the latter the phenomena present themselves in their highest intensity, the former has the advantage of familiarity with the normal intellectual process which all illusion simulates or caricatures. While the physician is naturally disposed to look at illusion mainly, if not exclusively, on its practical side, as a concomitant and symptom of cerebral disease, the psychologist feels more concerned with the mental antecedents of illusion and its relation to accurate and normal perception and belief. The fair conclusion is that the phenomena of illusion form a region common to the psychologist and the mental pathologist, and that the complete elucidation of the subject calls for the co-operation of investigators of either class.

It is Mr. Sully's object to work out, in the main, the psychological branch of the subject, viewing illusions of all kinds in their relation to the process of just and accurate perception. Occasional reference has to be made to the illusions of the insane, if for no other reason, because the two groups of phenomena are so similar and pass by such imperceptible gradations into one another that it is impossible to discuss wholly apart the normal and the abnormal conditions of mental action. What, indeed, is the strict definition of illusion? False or illusory perceptions, deceptive states of the senses, is the generally received reply. But much greater precision is obviously needed for the purposes of a scientific inquiry, and Mr. Sully devotes his opening chapters to an analysis and classification

of the modes in which illusory action of the mind presents itself in antithesis to real knowledge. Defining it provisionally as any species of error which counterfeits the form of immediate self-evident or intuitive knowledge, whether as sense-perception or otherwise, as distinct from errors of inference or misguided opinion, he lays down as the most obvious principle of classification the variety of the kinds of knowledge which each illusion simulates. All knowledge which has any appearance of being directly reached, immediate or self-evident—that is to say, of not being inferred from other knowledge—may be brought under four principal heads, internal perception or introspection of the mind's own feelings, external perception, memory, and belief, in so far as belief simulates the form of direct knowledge, such as prevision of an impending event. Without placing these four forms of cognition on the same logical level, or saying that they are to be kept apart in practice—memory, for instance, running like a thread through every process of the mental mechanism—he claims for this scheme of division that it will be found to answer closely to actual phenomena, and to cover every variety of illusion. By some writers who have made a special study of abnormal sense-perceptions, a fundamental distinction has been taken between illusion and hallucination, the former always having its starting-point in some actual impression, whereas the latter has no such basis. Thus it is an illusion when a man under the action of terror takes a stump of a tree, whitened by the moon's rays, for a ghost. It is a hallucination when an imaginative person so vividly pictures to himself the form of some absent friend, that for the moment he fancies himself actually beholding him. Illusion is thus a partial displacement of external fact by a fiction of the imagination, while hallucination is a total displacement. This distinction, first drawn out by Arnold (1806) and fixed by Esquirol in his *Maladies Mentales* (1838), as recorded at length by Brierre de Boismont in his work on Illusions, though of value in itself, is thought by Mr. Sully too narrow or unreal to be taken as the basis of classification. In the greatest number of hallucinations it is impossible to prove that there is no modicum of external agency co-operating in the production of the effect. The madman who projects his internal thoughts outwards in the shape of external voices may be prompted, for aught we know, by impressions, however faint, coming from the ear. That illusion shades off into hallucination by degrees which science fails to mark, has been recognized by writers on the pathology of the subject, such as Griesinger, Baillarger, and Wundt. The conviction is, in truth, forced upon us at every stage of psychological study that hard-and-fast lines of demarcation are utterly out of the question in dealing with mental phenomena. Nowhere is this conclusion more emphatically forced upon us than when our author takes up in detail the analysis of the first of his four classes of illusions—those of simple perception by the senses. There is absolutely no such thing known to us as a direct or primary impression of a special sense, distinct from repeated experimental action of that sense correlated with the impressions gained through other senses. The sense of distance, for instance, which is involved in every visual impression of an object—instantaneous, automatic, and unconscious, as it appears—is the result of innumerable complex acts of experience. To an infant, or to a man for the first time enabled by an operation to see, there is no such thing as distance. As Mr. Sully well puts it, the material of sensation is acted on by the mind, which embodies in its present attitude all the results of its past growth. A process of synthesis takes place, resulting in what was once termed an "image" in the mind, but now an "idea," the object seen having certain definite space properties, and holding a certain relation to other objects, and more especially to our own body in space. Next, the object is recognized as one of a class of things, an orange, for example, having certain special qualities, as a particular colour and taste. In the gradual process of filling up the image, there is a consciousness of likeness amid unlikeness, the recognition of which held a great and important share in the old philosophy of the association of ideas. As no person bathes twice in the same river, so it is no paradox to say, with our author, that strictly speaking no object ever appears exactly the same to us on two occasions. Apart from changes in the object itself, there are, especially in the case of living beings, varying effects of illumination, of position in relation to the eye, of distance, and so on, which may distinctly affect the visual impression at different times. Hence the introduction of conscious comparison and judgment, or the transition from common perception to individual recognition. A further distinction established by Dr. J. Hughlings Jackson is brought in by our author, marking off a passive and an active stage in the process, the latter being called perception proper, the former "preperception," a word employed by Mr. G. H. Lewes to denote the effect of previous perception, whereby an artist is enabled to see details where to other eyes there is a vague or confused mass, or a naturalist to see an animal where the ordinary eye only sees a form. The more frequently a similar process of perception has been performed in the past, the more ready will the mind be to fall without effort into the particular way of interpreting the impression. Without adopting Dr. Jackson's theory of the passive stage answering to the action of the right hemisphere of the brain, and the active stage to a subsequent action of the left hemisphere, we may agree with Mr. Sully in tracing in the expediting of the preperceptive process, where it has been often before performed, an illustration of the organic law that every function is improved by exercise.

This brief psychological analysis will suffice to show the difficulty of classifying the sources or modes of illusion even in the sim-

\* *Illusions: a Psychological Study.* By James Sully, Author of "Sensation and Intuition," "Familiarity," &c. London: U. Kegan Paul & Co. 1881.

plest stage of sense perception. We cannot say that our author arrives at any very definite scheme of classification, though he is able to mark off certain fairly definite groups. There are certain passive illusions, determined by the organism, whether from limits of sensibility, such as short sight, defective hearing, numbness of touch, and the like, or determined by the environment, as when light or sound is refracted; tricks of what is called natural magic, the impressions of the stereoscope, or the illusive imitations of solidity in light by art, being instances in point. Mere inattention is a common cause of passive illusion. Of active illusions, some are classed as voluntary, as when looking out of the window of a railway carriage in motion we picture at will to our mind the trees or telegraph posts as moving objects, or when we interpret the geometrical drawings of crystals, or other bodies, as being in relief or recessed. Imagination shows us faces in the fire, animals or warring hosts in the clouds. Among involuntary causes may be numbered vivid expectation or pre-imagination, whereby the audience greatly aid the success of a conjuror's tricks, or work themselves up to realize a presence or a levitation at a Spiritualist séance. Our author enlivens this part of his subject with amusing illustrations allied to the common experience of the sight of food making the mouth water, that of the appearance of a surgical instrument producing a nascent sensation of pain, or knocking at a dentist's door curing a toothache. A threatening gesture giving a vivid anticipation of tickling will beget the same effect as the tickling itself. A case is quoted from Dr. Carpenter of an officer who had to attend the exhuming of a coffin declaring he already detected the odour of decomposition, though the coffin when opened proved to be empty. M. Taine vouches for the fact of one of the most exact and lucid of modern novelists, whilst working up in his imagination the poisoning of one of his fictitious characters, having so vivid a gustatory sensation of arsenic that he was attacked by a violent fit of indigestion. We are reminded of the musical enthusiast in whom the scent of the hay-fields was so vividly conjured up by Beethoven's Pastoral Symphony as to bring on an acute attack of hay-fever.

In such cases Mr. Sully may well find it difficult to draw the line between illusion and hallucination. The voices of Joan of Arc, Dr. Johnson hearing himself called by his mother, Malebranche hearing the voice of God, and Mr. Francis Galton's interesting illustrations of the power of visualizing come under this category of mental phenomena. A further range brings us to the illusions of madness, or *délirium tremens*, complicated by the element of disease. The case of dreams, which is treated with much sense and judgment by our author, who has discussed the matter more fully in the new edition of the *Encyclopædia Britannica*, turns mainly upon reflex cerebral action, subject at the same time to stimuli of the nervous centres, either from internal processes, such as those of digestion or respiration, or external influences, such as sound, pressure, or irritation. It may interest our more romantic readers to hear, on Scherer's authority, of a youth who was permitted to whisper his name into the ear of his obdurate mistress, with the effect that she contracted a habit of dreaming of him, the consequences being of the happiest kind. Not a few excellent ghost stories resolve themselves into the *débris* of dreams, as in the case of Spinoza's "scurvy Brazilian," cited by our author, with apposite illustrations, from Mr. Pollock's recent Life of the philosopher.

The same method of treatment is applied by Mr. Sully to the other three classes of illusion which he has distinguished as those of introspection, memory, and belief. The first of these he would define roughly as an error involved in the apprehension of the contents of the mind at any moment, including the confusion of internal and external experience and the misreading or mal-observance of internal feelings. There are petty instances of self-deceit, such as a man's coming to think he is enjoying himself in society from the effort to seem as if he did; and one more to the point in Garrick's feeling himself to be a villain when he was acting Richard III. Of higher importance is the common belief in the freedom of the will, which, if we rightly understand our author's language, he himself, with a considerable set of our philosophic thinkers, assumes to be an illusion. People differ so widely in matters of taste or æsthetic enjoyment that some must perforce be held to live under "æsthetic illusion," it may be of a chronic kind; and the same thing may be said of the glamour which such and such writers or poets cast over their readers, or the spell which certain aspects of nature exert upon spectators or tourists. To the lover of mountains there is infinite illusion in the beauty of Dutch levels or American prairies. And how much illusion must there not be in the popular enjoyment of the works of sundry of our Academicians whom we need not name? Tricks of memory are too familiar to us all in their variety and their mischief to raise a complaint at the length and fullness into which Mr. Sully has been led whilst analysing and estimating them. The most puzzling of such strange deceits is, perhaps, the class known as false mnemonic images, when, on seeing or hearing something for the first time, the mind has a vivid impression of having seen or heard the same thing before. That our dreams may, to a large extent, be answerable for this sense of familiarity with novel objects we fully agree with Mr. Sully. Impressions of fancy, or fragments saved from a lost past, may chance to simulate the form of definite memory. A man may tell a fictitious story till he believes it, or may be convinced he has been at such and such a place from vivid descriptions or graphic pictures of it. In illusions of belief or of the imagination, which have the whole future and the unseen universe before them, there is absolutely no

limit to be sought for. Mr. Sully's analysis of his whole subject leaves us at the close impressed, on the one hand, with the ability of the writer's treatment; on the other, with the force of his practical conclusion that our intuitions or perceptions of things are more relatively than absolutely true, and that, after all the subtleties of speculation, the true standard of reality, as opposed to illusion, is a stable consensus of general belief.

#### POPULAR TALES.\*

THE collectors of popular tales are working, as M. Legrand says about the Greek investigators, *avec une sorte d'acharnement*. People are finding fairy stories where none were supposed to exist. Indeed, it is the experience of collectors that tales are often said by the peasants themselves to have disappeared in places where a little care and tact find them in quantities. M. Paul Sébillot has recently published two or three volumes of stories from French-speaking Brittany, and has given an instructive account of the best means of getting the people to tell their legends. An investigator should know the *patois* of the people; this at once opens their hearts to him. Mr. Andrews has found his knowledge of the Mentonese and other dialects of the Riviera invaluable in this research. School children and old or young women produce very curious local variants of all our familiar Northern tales; for example, into the story of "Whippley Story," or "Kumpelstiltzkin," the Mentonese peasants introduce not one, but three, witches, with difficult names. The best way to make the country people open their wallet of folklore is for the collector to tell one or two stories himself. This proves to the peasants that he has the same tastes as themselves, and they cease to be shy and to fear that they are being made the butt of his "educated insolence." It seems scarcely credible, in spite of the dull and half-starved life of an English labourer, that all the old English variants of popular stories are extinct. This is a field to which collectors should turn their attention. An amusing little book, *A Month among the Mere Irish*, lately published, shows that, at least before the famine, the Irish rustics retained abundance of extremely humorous stories. These, too, should be sought after by persons who have the opportunity.

Though there is still plenty of room for the labours of the collector, the time has come for a more scientific sort of work. It has long been plain enough that popular stories contain but a very limited number of incidents and situations. These are capable of an infinite number of combinations, like the pieces of coloured glass in the kaleidoscope, or the cards in a pack. Some student who has the leisure should make a digest of popular tales. The incidents should be tabulated after the manner of Von Hahn's tables, or of those drawn up by Mr. Alfred Nutt. Then the incidents of all known Märchen, African, Red Indian, Hindoo, Romaic, Australian, and so forth, should be arranged under their proper heads. It would then become sufficiently manifest that all races possess the scattered incidents, while the combinations become more elaborate, interesting, and artistic in proportion to the degree of intelligence and fancy of the people by whom they are narrated.

The two volumes of popular tales which we propose to notice to-day come from Southern Europe. The *Roumanian Fairy Tales* are translated, we imagine, from originals which have passed through the hands of the literary adapter. The anonymous translator is not a very skilled writer, and suffers from the delusion that "whomsoever" is a nominative case. In spite of these drawbacks, the little book, which makes no scientific pretensions, is very readable, and will be extremely interesting to English children. The first story, "The Slippers of the Twelve Princesses," is pretty well known already in its German form. This is not one of the tales for which a great antiquity or worldwide distribution can be claimed. The chief situation is the discovery by a gardener's lad of the fact that twelve princesses wear out their slippers by dancing all through the night with enchanted princes, in a fairyland where the trees are of gold and diamonds. Yet, modern as the form of the legend is, the situation is actually found in the mythology of the South Sea Islands, where the story is told to explain the origin of dancing. In the Roumanian and German story the boy manages to make himself invisible, follows the princesses, and, as a proof that he has been with them, brings back from the enchanted country sprays of gold, silver, and diamond trees. In Mangaia it is a boy named Koro, who notices his father's nocturnal disappearances, and observes that he brings back fresh necklaces of pandanus seeds, yellow and red. He lies awake one night, follows his father, imitates certain magical actions, and sees all the fishes of the deep come at his father's call and join him in the dance. "Tinirao exultingly joined his merry subjects in their favourite employment of dancing by moonlight." The end of the story simply is that Koro "instructed the inhabitants of Mangaia in the mysteries of dancing." In the Roumanian story, the gardener's lad who had followed the princesses naturally ended by marrying the prettiest of them, Lina. The tale is prettily told, though in a literary, not a popular, manner, and there are some details of local manners which give it a certain interest.

The second Roumanian story, "The Ungrateful Wood-Cutter," is

\* *Roumanian Fairy Tales*. London: Lewis. 1881.  
*Recueil de Contes Populaires Grecs*. Traduits sur les textes originaux.  
 Par Emile Legrand. Paris: Leroux. 1881.

of the moral sort. A mysterious being, strangely named Merlin, confers magical benefits on a wood-cutter, and withdraws them when the man becomes insolent and ungrateful. In the "Hermit's Foundling" we have the adventures of a baby who was brought up on roots and similar hard fare by an eremite. A lion protects the boy and furnishes him with everything he wants. "Put your hand in my right ear, and draw out what you will find," says the lion. In the Scotch story of "The Black Bull o' Norrway" the lassie is instructed that she will find all the food she needs in the bull's right ear. The frugal Scotch animal remarks, "Put back your leavings," a piece of thrift unknown to the Roumanian lion. The boy receives from the fairies a dress "embroidered with the sun on the chest, the moon on the back, the morning and evening star on the sleeves." This is like the robe of Xylomarie, or Marie à l'habit de bois, the Katey Woodencloak of Romaic folklore. She has three beautiful dresses, the first representing the heaven, with its stars; the second the fields, with their flowers; the last the sea, with its fishes. In the Roumanian story the hermit's ward succeeds in marrying a princess whose father he has cured of blindness. The Roumanian Daughter of the Rose is a fairy girl, who dwelt within the bark of a rose-tree, a prettier sort of hamadryad. She gives her love to a young prince, who deserts her; but, as in so many tales and songs of all countries, recognizes her on his wedding night, discards his bride, and returns to his old love. It is an original feature in the Roumanian legend that the Rose Maiden makes her way to the prince in the disguise of a monk. In the "Twelve-Headed Griffin" the true hero is personated by a villainous Tzigan or Gipsy, as in the Zulu nursery tale a strange beast takes the place of the lost heroine. The hero is restored to life by a good-natured fairy bull, and the Tzigan is torn to pieces by two horses, one a native of the plains, the other of the mountains. In "Vasilica the Brave" there is a delightful fight and transformation scene. Vasilica, the hero, becomes a wheel of green fire, and his wicked opponent a wheel of red fire, which dash against each other furiously, till the wheel of red fire is defeated, resumes its original shape of a dragon, and falls lifeless. The best of all these supernatural combats for two is that fought between the Princess and the Magician in the *Arabian Nights*. The poor Princess died, worn out by her exertions, but Vasilica the Brave was more fortunate. After destroying three dragons he had to subdue their mother, a lady whose daughters were of unusual beauty. For this purpose he took the shape of a kitten, and made friends with one of the girls. The she-dragon, when she came home, "sniffed to right and left, and exclaimed, 'There's the smell of man's flesh here from the other world.'" This remark is our old friend—

I smell the blood of an Englishman.

The Eumenides in *Æschylus* "smell man's flesh" when they detect the presence of Orestes. In the Namaqua legend (South African) about the woman who married an elephant, the elephant "smells the smell of man" when he enters his house, where the woman's brother is concealed. This incident, then, of the arrival of a man in the dominion of supernatural or monstrous beings, and of his being detected, is sufficiently ancient and widely distributed. The Roumanian story ends very prettily. The she-dragon puts Vasilica, in his disguise as a kitten, to various trials, and in all he escapes by his natural and kitten-like demeanour. He thus induces the dragon's daughter to follow him into the woods, and carries her off. Thus Vasilica gained a hostage from the she-dragon, who was obliged to leave him and his bride in peace. Among the other Roumanian tales are variants of "Hop o' my Thumb" and of "The Grateful Beasts."

If the Roumanian stories are somewhat too literary in form, the Greek tales translated by M. Legrand have a ferocity and impurity of character which make them quite unfit for a nursery audience. They are translated from two Romaic collections, the *Analektes Néo Helléniques* and the *Cypriaca* of M. Sakellarios. M. Legrand himself has collected more than three hundred legends, which are still unpublished. His most notable stories deserve a few words of notice. The first is "Le Seigneur du Monde Souterrain." This is the most repulsive shape of the "Cupid and Psyche" formula with which we have met. An old wood-gatherer one day evokes a mysterious negro by exclaiming, "Oh! Ah! Hélas." This was the name of the negro, who demanded the old man's three daughters as wives of the Lord of the Under World. He subjects them to trials of the most disgusting description. Only the youngest girl passes, and she becomes the bride of the Lord of the Under World. She never sees him by day; by night she is thrown into a deep sleep by an opiate. Her sisters, like Psyche's sisters, envy her wonderful palace. They advise her to throw away the soporific, to watch, and to turn a key in the body of her husband when he is asleep. This she does, and the moment the key is turned she sees all the kingdoms of the world. Her attention is caught by an old woman who is washing clothes in a river. The current carries away some of the clothes, the girl shrieks out to warn her and wakens her husband. He deserts her in anger, and she wanders, like Psyche, through the world. She becomes the servant of a King, the Queen falls in love with her, and, being rejected, accuses her, as Phædra accuses Hippolytus. She is on the point of being hanged, when her husband, the Lord of the Under World, rides up, rescues and marries her. The story is a singular example of the combination of incidents usually met with in very different compositions. The story of "Le Seigneur et ses trois filles" again is a singularly exact adaptation of the incidents in the story of Psyche. "La Vierge par nature" is

simply the story of the Master Thief which Herodotus was told by the Egyptians. One or two new incidents are introduced; but we know no popular form of the legend which comes so close to the version of Herodotus. "Xylomarie," of which we have already spoken, is a variant of Cinderella, and of "Ruhin Coatie," following the version which makes the girl's father anxious to marry her, because he has vowed to wed none but the woman who can wear the clothes of his deceased wife. The peculiarity of the Greek, as of the Servian Märchen, is this crudeness, this preference for incidents which have been softened down in the stories of France, Scotland, Germany, and Scandinavia. We might not expect this character among descendants of the Hellenes; but it seems probable that a tinge of Slavonic ferocity has been introduced into the legends of modern Greece.

#### EVELINA.\*

WE should indeed be well pleased were we to learn that this reprint of *Evelina* had met with the sale that it deserves. The publishers have brought it out in a clear type, a convenient form, and at a low price; while the editor, if she has now and then blundered, at all events has spared neither time nor trouble. In her Introduction she shows that she has carefully studied her subject. She does not, indeed, bring to it that intimate knowledge of the period of which she treats which secures a writer against falling now and then into some bad error. Nevertheless, she makes far fewer mistakes than many a more pretentious author who claims to be an authority on all matters that concern the literature of the last century. At times her style is not so clear as we could wish. In tracing the origin of the Burney family, for instance, she is certainly likely to leave her readers in a state of confusion. She has, of course, gone for her information in this part of her subject to Mme. d'Arblay's *Memoirs* of Dr. Burney. In spite of the high praise that she bestows on "the skill that may be observed in" that work, we shall still continue to look upon it as the most unskilful book that was ever written by a practised writer. We can never consult it without falling into a rage, and without forgetting for a time, in our indignation at Mme. d'Arblay's absence of method and her Frenchified English, all that we owe to Fanny Burney. Had Mrs. Ellis taken the trouble to draw up a family-tree of the Burney family, she would have saved herself and her readers some trouble. It would have been well also had she always given her references. It is not easy to follow them, as, though she gives the name of the author, she generally omits the page. No small part of her Introduction and of her Epilogue—as she strangely enough calls an addition to her Introduction which immediately precedes the story—is given to a defence of Miss Burney against the attacks of Croker. Surely Croker and his malevolence might have been suffered to rest forgotten. Miss Burney's character as unconsciously drawn by herself in her charming *Diary* needs no defender. He who after reading it could doubt the purity, the simplicity, and the uprightness of her heart will not be convinced though a second Macaulay should arise to fall upon a second Croker. At the same time, while we despise the slanders of the Tory reviewer, we must not pass over in silence the unjust abuse of his great Whig opponent. Mrs. Ellis quotes that part of Macaulay's violent attack on Croker's edition of Boswell in which he says that his readers have doubtless seen some of its sheets round parcels of better books. Great—monstrous we might well say—as were the faults of that famous edition, yet it had its great merits too, as has been more than once pointed out. In writing that its sheets were doubtless used for wrappers Macaulay was, we are confident, drawing, not on his knowledge, but his wishes. At all events, it was reprinted, certainly in a modified form and with its worst faults omitted, within four years; and it has formed the basis of the most popular editions down to the present time.

Mrs. Ellis, as we have said, does not show that general and accurate knowledge of the literature of the latter half of last century which, though we scarcely ought to expect, we might still desire in the editor of such a work as the one before us. For instance, using a somewhat fine term, she talks of Miss Burney's peers. Among these she includes Mrs. Carter, Mrs. Chapone, and Mrs. Montagu. Mrs. Carter was, indeed, a woman of ability and learning; but even she was not fit to hold a candle to Frances Burney. Mrs. Chapone was doubtless "admirable"—at least every one called her so—but we do not know that she was anything else, while Mrs. Montagu was little better than a literary impostor. She was a grand lady, kept open house for men of letters, and patronized Shakspeare. We have read her essay on that poet, and so we can with a good conscience treat her with contempt. In another passage Mrs. Ellis writes of Mr. (sic) Inchbald's vigorous and pathetic *Simple Story*. Mr. Inchbald had been many years dead by the time the story was written. In warning her readers against charging Miss Burney with egotism, she writes, "Not you did Soame Jenyns sue to meet, and at seventy-eight put on a court-suit of apricot-coloured silk, lined with white satin, that he might be presented to you in a worthy manner; while the Thralls and Mrs. Montagu, the Garricks and Miss More, Mrs. Carter and Mrs. Chapone, rose and stood to listen to his compliments." Now

\* *Evelina*; or, the History of a Young Lady's Entrance into the World. By Frances Burney. With an Introduction and Notes by Annie Raine Ellis, Author of "Elyvestra," &c. London: George Bell & Sons.

here we believe Mrs. Ellis has not only made an error in her facts, but has drawn on her imagination. Mr. Soame Jenyns was certainly dressed in the suit that she describes, but though we have carefully examined both Mme. d'Arblay's Memoirs of Dr. Burney and her Diary, we cannot find a word to show that he had altered his dress to do honour to Miss Burney. Be that as it may, the Garricks were not there, as poor Garrick had been lying for the last four years in Westminster Abbey. It was nearly two years, moreover, since Johnson had recorded on the death of Mr. Thrale, "I looked for the last time upon the face that for fifteen years had never been turned upon me but with respect or benignity." Mrs. Ellis may reply that by the Thrales she meant Mrs. Thrale and her daughter, a young lady not yet of age. But in the rising of a girl there would have been no honour done. Moreover, whoever mentions the Thrales at once brings before us not only the lively but "more flippant" wife, but also the husband, who, according to Johnson, had ten times her learning, and who, if he but held up a finger in his family, was obeyed. There are one or two other errors, which we need not notice. On the whole, Mrs. Ellis has done her part of the work well, and we must not therefore scan too strictly her failures. We, at all events, ought to bear her nothing but goodwill; for she has set us to read an old favourite once more, and she has been the cause that we have passed a few hours in a very pleasant manner.

If anything could check the rashness of those who so confidently maintain that the works of this and that writer of our time must live for ever, it should surely be the fate of *Evelina*. What popularity, for instance, has George Eliot enjoyed which was not enjoyed a hundred years ago by Frances Burney? The uncertainty of human life was not more strongly brought home to the learned and pensive Roman by his survey of the ruins of renowned cities than is the uncertainty of the fame of writers brought home to the student of literature by the darkness which has fallen upon some of the brightest names. If Miss Burney were to take her place by the greatness of her admirers, we know of no female writer of our country to whom she would yield. Her Diary, no doubt, is still read and still enjoyed; but even the best of her tales is comparatively unknown. How many in any company would know what a Branghton is, and if reproached with being one, would not ask with Boswell whether it was some animal hereabouts? Yet *Evelina* has qualities which would still, we might well believe, find it a host of readers. The character of the heroine is charmingly drawn. It is the picture of the author, not as she was, but as she might have been, had nature added a rare beauty to her other qualities, and made her romantic by reason of the mystery that was attached to her birth. When, leaving the gross heroines that are so common in the school of novelists that is now in fashion we read of *Evelina*, we seem to pass at once into the pure air of the breezy downs from an atmosphere that is tainted with the burnings of flaring chandeliers and with the breath of crowds that throng a town-house on the night of a dance. The plot of the story, though it is as improbable as most plots are, is nevertheless ingenious and interesting. Moreover, as it is not forced into the foreground, we are the less struck with whatever in it there may be that is extravagant. There is certainly no part in which the story is suffered to drag, but events succeed events with a rapidity that must satisfy even the most eager reader. Seldom surely did a young lady, in six or seven months at most, secure an equal number of lovers. But the great merit of *Evelina* lies not in its plot, or its love scenes, or its incidents, not even in the character of its heroine. It is as a picture of manners that it must claim to hold its ground. It abounds in portraits of every kind. Keen, indeed, must have been the eye and retentive the memory of the shy and quiet young woman who year after year had seen character after character pass before her in her father's house, and in the great world outside it. As has been before pointed out, she most fails, as might be expected, in those characters which she had never seen in the life. Her Lord Orville is sketched from Sir Charles Grandison, who, in his turn, most certainly was not drawn from the life. It is, therefore, the copy of a copy, or at best the copy of a mere fanciful portrait, and is, therefore, as stiff as it is untrue. This ardent lover, we notice, never goes beyond respectfully kissing the heroine's hand, even after his marriage with her had been fixed for the very next Thursday. The profligate baronet, as a piece of portrait-painting, is little better, perhaps, than the virtuous lord. But it is in the fops, above all in the fops of the City, and in vulgar life that the author shows her chief power. Her Branghtons, her Mr. Smith, and her Mr. Lovel are admirably described, while Mme. Duval is, in her way, almost unsurpassed. The rollicking humour of the Sea Captain keeps the reader constantly on the laugh, at the same time that it excites his astonishment at the grossness of an officer in the navy. Miss Burney, however, maintained that she was not guilty of exaggeration; for, as Mrs. Ellis appropriately quotes in a note, she wrote in her Diary, "I have this to comfort me—that the more I see of sea-captains, the less reason I have to be ashamed of Captain Mirvan; for they have all so irresistible a propensity to wanton mischief, to roasting beaux, and detesting old women, that I quite rejoice I showed the book to no one ere printed, lest I should have been prevailed upon to soften his character." She had a good opportunity of studying the manners of these heroes of the sea, for her eldest brother was a distinguished naval officer. In Mme. Duval, the vulgar old woman, and in her beau, poor M. Du Bois, the Captain finds people admirably well fitted

for even all his outrageous love of wanton mischief. His tricks are indeed carried too far, and the reader is not sorry to lose sight of him for a long time.

It is useless in the short space of a review to attempt to bring before the reader the liveliness of the scenes and the variety of characters of this story, which once was so famous, but which now only lives as it were in an echo. It may be the case that a book which raised in the men of a hundred years ago the heartiest laughter, and drew from the women at the same time many a tear, will now be voted unreadable. We wish, however, that those who call for their new novel almost as regularly as for their fresh rolls would for once make trial of an old favourite, and see whether a summer's day cannot be passed more pleasantly—it certainly can be passed more innocently—by laying aside the last fashionable story, and by following the fortunes of the gentle *Evelina*.

#### WEBER AND SCHUBERT.\*

THE demand for biographies of great artists in every line is very large, and under its influence a collection of little books has sprung into existence, to which some of the ablest men of the time in their respective lines have made contributions. Poets have dealt with the masters of their own craft, and philosophers with the great teachers of mankind; and now musicians, notwithstanding the doubts sometimes expressed as to their literary abilities, are telling us something about the peculiar race of men to whom their affections are most naturally attracted. Among these two whose biographies have lately appeared were men of just that peculiar spontaneity in art which makes the study of their characteristics specially interesting. Weber and Schubert are the two German types of the highest grade to which pure nationalism in music has ever attained, and their lives are most interesting to compare because of the singularly diverse conditions in which they were passed. This can very well be realized from the study of the little works by Sir Julius Benedict and Mr. H. F. Frost respectively. Weber stands before the world as the first who carried through successfully the arduous attempt to establish the national idea of opera, and Schubert as the first who set the German *Lied* on a firm basis by absorbing the greater part of the finest German lyrical poetry, and reproducing it in real German music. To understand fully the position which they occupy in art, it is necessary to realize, that as long as definite national characteristics exist in music, it is an absurdity to set a genuine poem or lyric of one distinct national type to music of a different complexion. At a certain point in national development the successful achievements of other nations, in departments in which the home country has not yet found its bearings, lead to the adoption of external forms both of government and morality and art, and even sometimes of religion. But these have in the end to be remoulded to the peculiar genius and character of the nation who has adopted them from without. Thus in Germany some important departments of music, such as opera and song, were long almost entirely swamped by Italianism. The effort to shake off this alien incubus was lengthened and laborious, and the nation waited for some incarnation of genuineness to produce the national musical counterpart of the dramatic and lyrical aspirations of the German race, and these things it fell to Weber and Schubert to achieve. But the manner in which it was achieved and the reception accorded to the victors was singularly different. Weber's work was done before the world as a public man, greeted with the wildest enthusiasm, and enjoying some of the greatest triumphs ever given to a composer; but Schubert met with little more encouragement than the love and faith of a small group of friends; he was thoroughly a private man, and the work he did was of a corresponding character—that is, more intimate than Weber's, though in the end possibly appealing to as great numbers in the privacy of their own homes. To the general reader it is possible that this point will be of some interest. For though Weber was often triumphant in his lifetime, the vein of sadness in his story is visible throughout; whereas the unsuccessful Schubert presents a picture of buoyancy and cheerful humour which makes what we know of him far more comforting to contemplate, notwithstanding an occasional outbreak of depression. Weber's very success seems to have been cruelly exacting, and destructive of serenity; and the small lasting comfort it can have been to him is well expressed by a remarkable sentence in a letter to Ignaz Susann, which is quoted in the biography. "A great success weighs like a heavy debt upon the soul of an honest artist, and he can never pay it as he earnestly desires." A few noble men besides him may have felt the same, but scarcely any could have expressed it in such a manner. Schubert was fairly relieved of such responsibility, and he had the more freedom to enjoy that which probably makes a man happiest in defiance of all circumstances—namely, the gift to do thoroughly well and with ease that which his nature clearly points to as his special function in life.

The treasures with which Schubert enriched the world are for the most part new discoveries; and, it may be added, some of the happiest discoveries of the latter half of the nineteenth century. It is not many years since musical people were occasionally surprised on making acquaintance with a sonata here or a pianoforte piece there to find that he had written something besides songs

\* *The Great Musicians.—Weber.* By Sir Julius Benedict. *Schubert.* By Mr. H. F. Frost. Edited by Francis Hueffer. London: Sampson Low & Co. 1881.

which was worth taking notice of. The writer of the biography says, that after his death in 1828 the publication of his works "proceeded steadily for five or six years, but after 1830 the stream consisted chiefly of songs and other vocal works, and then it almost dried up. The *Lieder* penetrated to France, where they became exceedingly popular, and from thence a few examples made their way to England. There seemed now a probability that Schubert's fame would rest entirely upon his songs." The world had, in fact, to wait for the insight of Schumann and the sympathy of Mendelssohn to be made to understand things which appear now to be of the simplest and most natural beauty conceivable. Schumann found out the great Symphony in C at Vienna in 1838, and Mendelssohn had it performed at Leipzig in the following year. There alone at first it met with due appreciation; for at Vienna it was coldly received, and when Mendelssohn took it with him to England, in 1844, the writer says:—"At the rehearsal the members of the band made such wry faces, and the few listeners expressed such unfavourable opinions that Mendelssohn withdrew it angrily." The unfinished Symphony in B minor, which to amateurs is probably even more familiar in these days, and possibly even more delightful, though presented to a Musikverein at Gratz by the composer, is said to have been never heard till 1865, about thirty-seven years after his death and forty-three after its composition. It was much the same with most of the other of his larger works, especially with such as people now take most delight in. It follows that his manner and sentiment, especially in instrumental music, is to the present generation almost as vivid and moving as if the work was just fresh from his hand. It has not been worn by use into familiar obviousness, but can be taken to men's hearts as lovingly as if it were the latest born of the divine offspring of art. In fact, the realization of Schubert's finest music is one of the special art enthusiasms of the present time, and it has an advantage over some other similar outbreaks in being genuine, and based upon something about which it is fit to be enthusiastic. This will make the more grateful the manner of treatment adopted by his present biographer. As he truly says, "Unhappily the biographer of Schubert is unable to give the reader the privilege of intimate communion with his hero, except to a very limited extent." The privacy and simplicity of his life would preclude any brilliant success in an attempt at Boswellian character-drawing; the records are too scanty and too little pregnant of inference; there only remains to do as the writer has done—to take the production of his works as the chief features of his history, and to throw some interest round them by criticism and accounts of their various but rarely prosperous fortunes. Musicians are often inquisitive about the ways in which great masters go through the process which is called composing. In the case of Schubert there is, of course, not much actual information; but there is plenty of obvious inference to be drawn from the condition in which some of his manuscripts are found; and these are properly detailed in the biography. It is also told that when the composer and the poet Mayrhofer were living together, "Mayrhofer would sit at his desk and write some stanzas, and then toss them over to Schubert, who would immediately commence to set them, without the slightest hesitation." The marvel, of course, is not that he could do it, but that the result should be in general so satisfactory. Plenty of composers can sit down and write at any moment; but, unless they have given some consideration to the subject, the chance is that what comes is not worth setting down. Schubert, however, was not one of those who had to meditate and ponder over things like Beethoven, nor would he willingly alter and prune afterwards as Bach seems to have done. He had the gift of spiritual beauty in an astounding measure, and music was so much his proper and peculiar mode of utterance that want of time or paper was almost the only hindrance he was likely to be troubled with. In songs he seems almost at first to have laid hold of his own distinctive mode of expression, for the "Für König" and the "Wanderer" were written before he was twenty. In instrumental music there seems to have been distinct development, as the writer indicates. The early Symphonies have but little traces of his manner, and even the matter is often singularly like passages of Mozart or Haydn, and sometimes of Beethoven in his early days. Occasional glimpses of his promise are seen, and indications of such features as he perfected at last in the last movement of the great Symphony in C; but, as a rule, they are curious proofs of the certainty that even the most original-minded men must begin to build upon something familiar. The writer gives less prominence to discussion and criticism of the *Lieder* with design, because "the extent and value of his larger works is yet imperfectly recognized"; and also, probably, for the inevitable reason that, if accounts and criticisms of the songs were once begun, it would hardly be possible to stop short of a few thick volumes; nevertheless he says rightly that "it is as monarch of the *Lied* that Schubert's greatness and individuality shine forth most conspicuously." His instrumental works are full of beauties as divine as anything in music; but the works taken on the whole have not the qualities which made Beethoven supreme. Even the best of them are hardly models of the highest qualities of balance and proportion. They are not concentrated, and they are not always consistent or carefully and closely developed; but the writer is near the mark when he says "an exquisite fancy, a noble imagination, and a lofty poetical spirit" were never possessed in richer profusion than by Franz Schubert.

The life of Weber is treated by Sir Julius Benedict on a different principle, for the best of all possible reasons. The writer was himself the intimate friend and pupil of the great composer; and

the account he gives as an eye-witness of his ways and his works, his troubles and his triumphs, are sufficient to make it interesting to a high degree, while the work is done in a manner which disgression for the purpose of detailed art criticism would certainly mar. A classical position is so soon reached in music, that it seems almost as strange to one's feelings to find a contemporary writing his personal recollections of Weber and Beethoven as if he wrote in the same manner of Titian or Leonardo, or of Virgil or Horace. But here is the fact, and it is one to thank the grudging fates for sparing us. Weber's life was, in most respects, a very strong contrast to Schubert's. His erratic and Bohemian father dragged him about from place to place even in his childhood, cramming him with various and ill-regulated information, and trying, at all hazards, to make a great star of him with all the speed possible. The result was that Weber was for the most part unfortunate in his masters, cruelly tried in health, and subjected to influences which for a time certainly led him in an evil direction; but his genius, combined with the force of public circumstances in a time of peculiar political importance to the Fatherland, overcame much of the harm done by the first and last causes, and led him finally to some of the greatest achievements in musical art. He was brought before a large public from his very boyhood; and the enthusiasm of that crisis in the nation's existence seemed to have laid hold of him, and to have made him at times the very mouth-piece of some of the finest qualities of popular emotion. To this fact may reasonably be traced his extraordinary successes with the people; and to that also in turn the prejudice of many able contemporary critics against him. Zelter's sublimely preposterous criticism of *Der Freischütz* which he wrote to Goethe that "out of a small nothing the composer had created a colossal nothing," and the remarks of Tieck, that "it was the most unmusical uproar ever heard upon the stage," and many more such, have touches of humour in them which would be quite exhilarating if one did not feel how bitterly they must have caused the sensitive Weber to suffer.

When the writer of the biography first went to him, Weber was occupied with the pianoforte arrangement of *Der Freischütz*, and he describes his first impressions of the man and the circumstances in which he found him vividly, and, it may be hoped, notwithstanding the length of time that has intervened, faithfully. Shortly after was the first performance of the great work, at which he was present, and he makes admirable use of the opportunities which the excitements of such an occasion offer to any one who can wield a pen. On the very morning of the performance Weber, who appeared to be the only person free from anxiety, played to him and Frau von Weber the celebrated Concertstück in F minor which he had just finished, giving at the same time a curious account of its purport, which has a remarkable bearing on the modern theory of programme music. He was with him afterwards through various experiences of clique intrigue, aristocratic stupidity and bad taste, and the many vicissitudes to which a popular artist is subjected; and he rightly gives particular attention to the story of the composition and production of *Euryanthe*, which has even more points of human interest about it than the story of the supreme success of *Der Freischütz*. But a yet more interesting passage is that which describes his actual experiences of sight and hearing with Beethoven himself. It is well known that Weber was in early days a decided disbeliever in that mightiest of musicians; and had made himself conspicuous by a yet well-known squib upon a performance of one of the Symphonies. As he grew older he grew wiser. He played the Sonatas especially well, and made great efforts to obtain a worthy performance of *Fidelio*, and succeeded, except with the public; of whom he said in a letter to Günsbacher, "It is enough to make one frantic—Punch and Judy would suit them better." And so it came to pass that Beethoven, seeing the pupil one day at a publisher's, asked him why Weber did not go to see him; and then master and pupil went together, and the yet living eye-witness of that extraordinary meeting gives a worthy account of the occasion. Weber himself wrote of it afterwards:—"We dined together in the happiest mood. The stern, rough man paid me as much attention as if I were a lady he was courting, and served me at table with most delicate care. How proud I felt to receive all this attention from the great master-spirit." This appears to have been in 1823, and later in the same year the pupil parted sadly from his master. But his affection evidently did not wane, and so the interest of the story does not wane either. The few remaining years are of the keenest and saddest interest, comprising the story of his rapid breakdown in health from overwork and constant worry, the ups and downs of titful fortune, the tragic story of the composition and performance of *Oberon*, and the fatal termination of that episode in England. There is so much in all this that it does not admit of condensation. The self-sacrifice and devotion of the man come out in the strongest colours, and people who have not known what he was before have now an admirable opportunity of being wiser.

Criticism of his works is reserved for a separate catalogue, with the exception of some general remarks on his treatment of overtures, with special reference to the works to which they belong, and to his position in relation to what is called the romantic school. Many of these works are now taken so much as a matter of course that little that is fresh can be said about them; and for the rest there is no denying that he was an unequal composer. He had, like Schubert, the eminent gift of saying something definite. He had ideas, and these frequently very impressive and genuine ones; but neither his training nor his disposition made him certain of

hand or head in dealing with pure instrumental works. He wrote both popularly and finely, but rarely in that department with consistent musical excellence throughout. His great achievement was, as Sir Julius Benedict says, "the most national lyrical drama of the German stage"; and it is this nationalism which draws him and Schubert together in the history of art, though it failed utterly to bring them into personal amity. Their manners of musical speech are conspicuously diverse. Schubert appeals most powerfully to later generations; Weber appealed most strongly to his own. Nevertheless, the pedestals they occupy are of similar cast; and these two biographies will no doubt help to a clearer appreciation of their work and position, and the generally interesting contrasts and affinities which are worth noting in their circumstances and characters.

J. F. MILLET.\*

TO write the life of an original artist is a task which demands a full comprehension of the artistic temperament, and which necessitates a great deal of ungrateful labour at the hands of the man who undertakes it. M. Alfred Sensier was undoubtedly well fitted to write the life of Millet. He had lived for thirty years on terms of great intimacy with him, and was one of the first to appreciate the peculiar excellences of his works. But death cut him short in the midst of his uncompleted labours, and his manuscript, left in an unsatisfactory condition, had to rely for completion upon other hands. This fact detracts from the value of the book as it stands in the original, and it is of course impossible that its shortcomings should be in any way removed by the process of translation. Yet, in spite of these disadvantages, the book before us is in many ways valuable. It will do away for ever with the idea that Millet was a rude untaught peasant, and will destroy many other fallacies concerning him which have hitherto been prevalent.

Jean François Millet was born on October 4, 1814, at Gruchy, in the department of the Manche. What is known concerning his family is very remarkable. They were no common peasants. His great-uncle, who had much to do with his early training, was an exceptional man. Half priest, half paysan, he would say mass betimes, and then donning his "soutane," he would betake himself to the labour of the fields. The walls which he built unaided, to support a piece of falling ground, still stand, and bear witness to his Herculean strength. He taught reading, and even Latin, to the village children, whereby he greatly scandalized his neighbours, who vainly petitioned the Bishop against his strange ways. When he died, the boy Millet was entrusted to the care of Jean Lebris-seux, the young vicar of Gréville, who taught him to love the Bible and Virgil. With him Millet had a touching meeting later in life. After a hard day's work he went into the church of Gruchy, where he found his early instructor, grown old, praying at the altar. After the first words of greeting the Abbé asked him if he still remembered the Bible and the Psalms:—

"They are my breviary," said Millet. "I get from them all that I do."

"These are rare words to hear nowadays, but you will be rewarded. You used to love Virgil."

"I love him still."

Millet never saw his old friend again, but the good priest's influence over him lasted through all his life. Luckily for him his father had something of an artist's soul, and, seeing the merit of his first attempts, advised him to adopt art as a profession. After studying for a short time at Cherbourg, he went to Paris. His first impression of the town was miserable enough, and it was long before he plucked up sufficient courage to enter the studio of Paul Delaroche. It would be difficult to imagine a more uncongenial atmosphere for him. Delaroche, deeply imbued with the theatrical claptrap of his day, relying for success upon an adroit choice of subjects and a vulgar flashy execution, must have secretly disgusted him from the first. The other pupils for the most part followed blindly in their master's footsteps, Couture and Hébert making brilliant exceptions to the prevailing rule of stupid plagiarism. Millet was not happy as a student. His bold work irritated his comrades, who declared it to be "insolently natural." He did not remain long under his uncongenial master, who ended by utterly disgusting him by the shuffling and favouritism he displayed concerning the "Prix de Rome," for which Millet competed. He accordingly took a studio in the Rue de l'Est, and began his battle with the world. It was a hard fight. Nobody cared for the rustic life he delighted to portray, nobody had eyes to see the noble blinding of high poetic thought and uncompromising realism which made itself felt in his work. But, like a true man, he set his face like a flint to the task of bread-winning. Nothing came amiss to him; portraits at ten, and even five, francs a head; signboards and pastels *à la mode* succeeded one another with rapidity; and, through it all, he managed to find time for serious study. To make matters still worse, he married, losing his wife in two years. He had children, and his life became a fearful struggle to support them and their mother. He says of himself, speaking of this time, "I felt that I was nailed to a rock and condemned to endless labour; but I should have forgotten all if I had only been able once in a while to see again my native place." At last, in the

year 1849, he met with some little success, and settled at Barbizon, which has since become identified with his name. It is curious and perhaps profitable for Englishmen of to-day to consider the pass to which academic rule had brought the French art of this period. Through all these years of struggle the doors of the Salon had been closed against Millet. Théodore Rousseau had, in despair, given up attempting to exhibit; half Delacroix's pictures were refused, and Jules Dupré, utterly disgusted with the taste of the authorities, declined to exhibit.

So far the book before us has proved interesting. The facts concerning Millet's Paris life have not been widely known hitherto and cannot fail to command attention. But with the years that he spent at Barbizon it is otherwise. Here the public had nothing new to learn about any of the events of his life that concerned it; but it might have been expected that much delightful matter would be furnished by a man who had such frequent access to him as M. Sensier enjoyed. This, however, is hardly the case. Millet's biographer appears to us to have shared the lot of the miserable person with the two stools, who has been ceaselessly hounded with citations from one generation to another. He had neither the heart to write a book strictly with a view of pleasing the casual reader, nor to write one which should be of permanent value to the students of Millet's works. Consequently, this most interesting phase of Millet's life when he first came in contact with the plains surrounding Fontainebleau Forest and the peasants who cultivate them is most inadequately dealt with. Who can care to know that he and Rousseau, who became fast friends and helped one another nobly, looked upon each other for a short time with mutual distrust? And to whom shall it profit to be pedantically informed that Corot had no keen sympathy with Millet's art? The fact must have long been apparent to any one not hopelessly afflicted with imbecility, who had ever compared any two examples of the artists' works. Page after page is taken up with what seems to us to be a most sacrilegious laying bare of the private life of a great man. It was well known that Millet was very poor all his life, that he was often in the direst straits for want of money; but surely this was no reason for publishing confidential letters about his private affairs, or for writing sentimental commentaries on them which are often in the worst possible taste. The first important work produced by him at Barbizon was his magnificent picture of the Sower, which has been disgracefully thieved from ever since people have come to the conclusion that it was worth stealing. A curious anecdote was published a little while ago about a sketch which Millet made at this time of Ruth and Boaz. He was expressing his dissatisfaction to a friend at the state of art criticisms, and ended by saying that the "premier venu" knew more about pictures than Théophile Gautier. At this moment a villager entered his studio and began laughing very heartily. "What are you laughing at?" said Millet. "At your picture," replied the man, pointing to the sketch. "It is so true to nature that rural policeman arresting the girl for stealing in the fields." From this time till the day of his death Millet's pictures were given out to the world in glorious succession. We shall not attempt to give our readers any list of them here, but refer them to the work before us. We may quote, however, what he wrote of his picture of the Shepherd in the Fold at Night, which is now almost as widely known as it deserves to be. He says:—"Oh, how I wish I could make those who see my work feel the splendours and terrors of the night! One ought to be able to make people hear the songs, the silences, and murmurings of the air. They should feel the infinite. Is there not something terrible in thinking of these lights which rise and disappear, century after century, without varying?"

After many years of intense suffering Millet was enabled to live almost at ease for a short period by making a contract in March, 1860, with a picture dealer, by which he engaged to part with all the pictures he might be able to paint for the three following years for a salary of 480*l.* a year. This arrangement enabled him to produce some of his finest works, and procured him some instances of comparative comfort. A conversation in which he took part at about this time shows how true an insight he had into the souls of the poor among whom he lived. "Do you not hear," he asked, "the Witches' Sabbath over there at the end of the Bas-Bréau—the cries of strangling children, and the laugh of convicts? Yet it is nothing but the song of night birds, and the last cry of the crows. Everything frightens when night, the unknown, succeeds light." In the midst of a raging storm of criticisms, of absurd blame, and ridiculous praise, the painter worked steadily on. It is touching to find his friend Rousseau purchasing some of his pictures under the pretence of having made a bargain with a rich American who of course had no existence anywhere but in Rousseau's own brain. In 1868 Millet was made Chevalier of the Legion of Honour, and the reading out of his name was followed by tumultuous applause. The last years of his life brought comparative peace with them in spite of failing health. He lived to see his pictures fetch great prices, although the money did not in any way benefit him. He died on the 20th of January, 1875. That his loss should have been keenly felt is not astonishing. But it is strange to note how few were those who foresaw how great his posthumous fame would be. Of the book before us it is by no means easy to form a just estimate. The work has been very inadequately done, but we may be thankful that it should have been done at all although we cannot help regretting that stronger hands were not found to do it. The author seems to have been everlastingly conscious that a great many people might disagree with him in his estimate of the great man, and

\* *Jean-François Millet, Peasant and Painter.* Translated by Helena de Tray from the French of Alfred Sensier. London: Macmillan & Co. 1881.

the result of this is naturally enough felt in a certain half-heartedness of expression throughout the volume. It is besides most painful to find valuable information about such a man bolstered up with commonplace sentimentalities written to catch the attention of vulgar readers. Of the miserable renderings of Millet's work offered to us we cannot speak too disparagingly. All the solidity and vitality of the painter's handling have been smudged and blurred away; the "Woman carding wool" (page 155) is the only plate that in any way recalls Millet's touch. Of the translation we can only say that it is so literal that it frequently ceases to be English, and as in addition to this it is bristling with Americanisms, it is no light reading.

#### NEW CODE READING BOOKS.\*

WE have before noticed the very marked improvement which within the last few years has taken place in the quality of elementary school books. Not only is the information which they contain more accurate, but it is presented in a more attractive form. This is especially noticeable in English histories. Indeed so many good and pleasant little books on that subject have lately made their appearance, that one would think the demand for that class of literature must have been already more than satisfied. A fresh crop of them, however, has sprung up this season with even more luxuriance than the customary yearly growth. At first a reader might be puzzled to account for this startling increase in the supply of a class of books the production of which, though a steady source of revenue to publishers, is a most unprofitable and much detested task-work to authors of any repute. But on examination the *raison d'être* of their existence is found set forth in the prefaces of the several series to which they belong. In the Education Code for 1880 it has been decreed that the reading lessons of children of all standards in the public elementary schools are to be turned to account for the teaching of history and certain other subjects which are to be "taught throughout the year through reading lessons, according to a graduated scheme which the Inspector reports to be well adapted to the capacity of the children." The heads of the Education Department have intimated that for the carrying out of the scheme some new text-books were much to be desired, sufficiently attractive in form to please the children, and yet solid enough in the substance of the information given to serve the teacher as a foundation for oral teaching. The books required are to be written in a pleasant easy style, and to treat of subjects supposed to be the most interesting to children. Thus the so-called histories are to dwell chiefly on biography, and to give the children a notion of the social life of the people by describing the manners and customs of the several grades of society at the different periods of their country's history. All this knowledge is to be conveyed in forty to sixty lessons, of length proportionate to the time allotted to the English reading lesson in the school-work. It is calculated that two such lessons should be given weekly, and it is proposed to have a progressive series of books suited to the several standards, each containing a year's instruction. Now it will be seen at once by any one who has had any experience either in the use or in the production of school-books that to write a book of the dimensions and on the subjects prescribed that shall at once be scientific enough to teach the teachers and amusing enough to attract the children, that shall contain enough of the fibre of fact to entitle it to bear the name of history and yet have that fibre overlaid with enough prattle about the houses, dress, way of feeding, and so on of Scots and Picts and early English to give a lively picture of their social state, is a task well nigh as impossible as the spinning straw into gold of the fairy tale. Difficult as it seems, however, it has been attempted by authors of all degrees of reputation and of views the most opposite.

Of the various series which this new Education Code of 1880 has called forth, that issued by the Messrs. Longman, under the title of "English History Reading Books," merits our first attention. To this series Mr. S. R. Gardiner contributes two volumes. The first contains an outline of the history of Britain from the coming of the Romans to the accession of James I. The second carries it on in the same style down to the year 1880. Mr. Gardiner's reputation as an historian is a sufficient guarantee for the entire trustworthiness of the matter which these little books contain. The style in which they are written is simple and clear without being childish. Dates are eschewed altogether, except as headings to the chapters, and the pages are kept as clear of names of either places or persons as is compatible with the production of a book that can in any sense be called history. Mr. Gardiner treats history from the Liberal point of view, and brings into due prominence the events which, as having had an influence on the development of the national life, deserve a foremost place in the history of the nation. Thus, the setting up of the first printing-press and the translation of the Bible are treated as matters of much more moment than the gaining or losing of a battle on foreign soil, or the transfer of the Crown from one family to another. To set forth the constitutional changes, the progress of religious and poli-

tical opinions, the revolutions wrought by the advance of science in agriculture and manufactures which characterize his second period in a manner that should be intelligible to the children for whom his book is intended, is an undertaking of no small difficulty. He has, however, succeeded in making his pages, if not exactly entertaining, at least clear and readable. Mr. Gardiner never fails to give due force to the moral lessons that history teaches where it is rightly understood; and concludes with a well-worded and earnest exhortation to his readers to remember that the greatness of a country is increased or diminished by the character of each unit of its population. We must not omit to mention that Mr. Gardiner's text is embellished with numerous maps and illustrations of costumes, civil and military accoutrements, portraits of distinguished persons and such like.

Belonging also to the same series, but probably designed for an earlier standard, are the Lives of Richard I. and Edward I. by Mrs. Armitage, and of Alfred the Great and William the Conqueror by Mr. Powell. These little books are clearly written to suit the views of those who maintain that children can only be interested in history by reading a somewhat detailed biography of one of the leading characters in any given period. There is, no doubt, a great deal to be said in favour of this view, though it seems questionable whether, if children are incapable of taking in history as a connected whole, the knowledge of a few detached shreds of it can do them any possible good. It is usually taken for granted that in one series of books, more especially school-books, the writers shall hold pretty much the same opinions. Now Mr. Gardiner points out that, of all the kings of England, Richard I. is the one who most thoroughly neglected the duties of a king, and who has therefore least claim to be remembered by the English people. It is, therefore, certainly most inconsistent to make him in the same series of books the subject of a special biography of a length to occupy quite six months of the reading lessons of the school year. Mrs. Armitage, no doubt, points out that all his exploits were of little use to the world, and of still less to England, and contrasts Richard and Edward I., greatly to the dispraise of the former and to the credit of the latter; but, if Richard I.'s actions be not worth remembering, surely it is a mistake to bring them under the notice of children, who are apt to prefer a free-fighter and a doughty dealer of blows to a wary legislator and unprejudiced administrator of justice, however wise and beneficent the latter may be.

Mr. Powell's Life of Alfred begins with an account of Alfred's christening, in which an attempt is made to present to the children a minute and elaborate picture of the appearance of the country and of the details of domestic life in the England of those days. Let us hope it is more true to life than the ideal Rome which Mr. Powell supposes the child Alfred to have seen. When we read that in that city amongst its beautiful buildings "huge cathedrals" were conspicuous, we only wish Mr. Powell would explain how many of these same cathedrals are still left, and which they may be of the Low existing churches in Rome.

Another series of English History Reading Books has also been submitted to us for criticism. It is published by the "National Society," and declares itself "adapted to the requirements of the New Code of 1880." Of this the second and third parts, intended for the use of the Third and Fourth Standards, are by Miss Yonge, and contain an outline of the history of Britain from the year B.C. 54 to the battle of Bosworth. The style and language are exceedingly simple, showing that the writer has had practical experience of the difficulty that is found in getting children in elementary schools to take in a lesson unless it is conveyed in the words and expressions that they are accustomed to hear in daily use around them. But in these little books, as in her other historical works, Miss Yonge treats all historical events as too much on an equality. She cannot see the difference between an event perhaps little noted at the time, but from which sprang much good or ill for later times, and an event which perhaps filled men's minds much at the time when it happened, but which, as unproductive of results, deserves only to be forgotten. Still there is less of pageantry and elaborate detail of costume and chivalry than we should have expected from the author of the *Cameos*. Perhaps rather too much space is given to the crusading exploits of Richard and Edward I., which, after all, had nothing whatever to do with English history. In the same way the amount of pages which are occupied by the account of the Hundred Years' War and the Wars of the Roses would lead children to suppose that they were of more importance in the history of the country than they really were. Nor can we see that it can in any way benefit the children in elementary schools to read a description of all the ceremonies and swearings that "went" to the making of a knight or learn that all the Danes were massacred on "St. Brice's night," when they cannot possibly know who St. Brice was, or why or when his day was kept. Miss Yonge's text also is enlivened with illustrations designed to aid the children in realizing more vividly the scenes and subjects to which the letter-press introduces them. Opening the first part at random, we light upon "Croyland Abbey, burnt by the Danes"; but it seems to represent something much more like the ruins of the Abbey as they stand now than they could have been either as the Danes found them or left them. Now, pictures that are intended for instruction ought at least to be faithful delineations of the object at the time stated, and such a mistake as this is quite enough to give children quite hopelessly confused notions about early English architecture. In this series of readers the difficult words in

\* Outline of English History. S. R. Gardiner. *Richard I. and Edward I.* R. S. Armitage. *Alfred the Great and William the Conqueror.* F. York Powell, M.A.—*English History Reading Books.* London: Longmans, Green, & Co. 1882.

*English History Reading Books.* Miss Yonge.

each lesson, of which happily there are very few, have been written out at the end of the lesson, the better to impress the spelling of them on the children's minds. This is an excellent plan; but the footnotes that are added here and there, with instructions as to the proper pronunciation of certain foreign names, will lead to some very strange utterances both from those taught and their teachers. Thus, Rouen is to be "pronounced Roo—and the *en* spoken through the nose"; but to say *en* through the nose will never bring any one to anything the least resembling the French nasal sound. The old-fashioned *ahng* of the self-teaching dictionary comes much more near it. The same objection must be urged against the direction "In Anjou the *an* must be spoken through the nose"; and, again, "In Angers pronounce the *g* as *j*, and do not sound the *e*," will only result in the final syllable being called "jer," not "jay," as was intended. Pieces of poetry are given between the lessons, by no means so simple in language as the lessons themselves, but commemorative of the subject taught; and genealogical tables and easy questions for examination are affixed to each part. Such questions are of very great use, both as preparing the children for formal examination and as assisting them to put the knowledge gained in each lesson into a definite and orderly form. Above all, they are much to be commended as aids in the very hard task of getting children to answer a question directly—a triumph, if Inspectors may be credited, which is hardly ever attained in elementary schools.

#### CAPE'S STOICISM.\*

WE are glad to welcome from Mr. Capes a volume dealing systematically with a subject which he handled incidentally in his contribution to the series of "Epics of Ancient History." In his volume on the *Earlier Empire* the reign of Nero made it necessary to say something not only of Seneca but of his philosophy. The chapter on the Age of the Antonines brought before us some pictures of stoicism as it appeared in the person of the master of the Roman world. The portraits were only in outline; but the outlines were carefully drawn, and those who examined them could not fail to see their truthfulness and their force. It would, indeed, be difficult for Mr. Capes to treat of past conditions of thought and of society without instructing as well as delighting his readers, while these in their turn could scarcely turn over a page without seeing that they were following a writer who regarded the mode of telling a story as matter worthy of all pains. For Mr. Capes the past is alive, and its records are the records of living men, and all that he has to say about them is said in a style of singularly careful rhythm. Of many a passage we are tempted to say that it is flawless; and, in truth, if they are not perfect, it is because he has not reached that highest stage of art in which the art is hidden. In other words, Mr. Capes sometimes lays himself open to charges of mannerism; and his books have given us so much enjoyment that we cannot help regretting that these charges would not be in all instances without foundation. It is from no love of finding fault, but rather from a sincere wish to see good work improved, that we venture to point out a few of the imperfections arising from the use of forms which must, we fear, be set down as tricks of language.

Among the most prominent of these devices is the employment of a comparatively small number of favourite metaphors and metaphorical words, the prefixing of an epithet to almost every name, and the too frequent reappearance of the same epithet with the same name. Before he became emperor, Nerva had written some verses; Mr. Capes gives us this fact by saying that "he had dallied with the Muses and courted poetry in early years." Nerva cared little for show; and we are told that "he had few expensive tastes and little love for grand parades, refusing commonly the proffered statues and gaudy trappings of official rank." These sentences come from the opening paragraph of the "Age of the Antonines"; we find their fellows scattered plentifully over the pages of the chapters on Stoicism. In a style so carefully balanced our ears are slightly jarred by displacements of the negative, as when we are told that Thrasea was considerate in the utterance of his judgments "lest he should seem not to hate the evils only, but the evildoers"; or, again, when we read of zealous Stoic philosophers, attending deathbeds that "they were not there to shrive the penitent and offer absolution, but to strengthen the tones of manly resignation" (p. 111). The strengthening of tones of resignation is a phrase not unlike that which speaks of the Senate meeting only to register their master's whims (p. 100). We have to face again and again the "parade" which Nerva disliked, and that curious phraseology of attitude and gesture which seems to have for Mr. Capes an irresistible charm. It is applied to things as well as to men. Thus, in Cicero's *De Officiis*, "Stoicism," we are told, "poses as a philosophy of common sense, dropping all its airs of paradox" (p. 72). So, too, "the Empire posed as the defender of the faith" (p. 92). So Thrasea "flaunts his republican ideal" (p. 104). If women talk together, they prattle; if a philosopher unbends to his pupils, he chats with them at his bedroom door (p. 109). Messalina "flaunts her orgies of extravagance in the sight of the people" (p. 121). The wide sympathies of Marcus Aurelius are shown by language in which there is "no arrogance of paradox, no lofty airs of scorn for the

weakness and the suffering which cannot freely breathe in those serene heights" (p. 213). The braggart "parades his glib phrases," and the cynic vagrants "in their coarse effrontery dragged high professions through the mud" (p. 125).

If we have dwelt too long on slight imperfections of manner, it is only because a good English style is too precious a thing to be lightly dealt with. Mr. Capes can write with vigour as well as with good taste; but his temptation distinctly is to artificial niceties of language, and he will do well to be carefully on his guard against it. When, from the manner we turn to the matter, the room for fault-finding is small indeed. Mr. Capes might have given us a more lifelike picture of Zenon, and in this respect his work is scarcely equal to the more carefully drawn portraiture which Mr. Wallace in the same series has given us of Epicurus. But, on the other hand, we have in these chapters on the Stoic systems a series of judgments which cannot, like some of those in Mr. Wallace's volume, be charged with indistinctness. After a careful examination of these systems, he comes to the conclusion that even a man like Seneca had no consciousness of a personal God, and no clear expectation of a continued existence after death; and he tells us so plainly. There is no attempt here to pass off vague talk about deities who lurk in the chinks and crevices of the universe as a legitimate belief in God, or to regard statements as fundamental on which nothing whatever is based. But complete consistency is no easy task; and Mr. Capes, we are inclined to think, has run himself into something like contradiction in his pleadings on behalf of Seneca against the good-humoured sarcasms of Macaulay. When Macaulay speaks of the Stoical philosopher as declaiming in praise of poverty with two millions sterling out at usury, and celebrating the divine beauty of virtue with the same pen which had just before written a defence of the murder of a mother by a son, Mr. Capes can see in the criticism little more than a reproduction of "the invectives of a rancorous opponent, uttered in the crisis of a personal struggle." When Seneca received from the Emperor the message which compelled him to die, he asked, "Who knew not Nero's cruelty?" adding, that "after a mother's and a brother's murder nothing remains but to add the destruction of a guardian and tutor." If he said these words, the forgetfulness of the philosopher is more amazing than his serenity; and no one could exhibit the nature of the forgotten fact more clearly than Mr. Capes. He is perfectly well aware that preachments of poverty come, to say the least, with an ill grace from a man in the position of Seneca; he is also aware that in the matter of Agrippina's death he was simply an accomplice in murder, and he does not hesitate to say so:—

Many a looker-on [he tells us] would have swept away such pleas as hypocritical trifling, and sneeringly contrasted the high professions of austere philosophy with the growing wealth of the great minister, whose broad lands and mansions might be, and were, regarded as the price of blood. It was hard enough before to find an answer to such taunts, but it became almost impossible when he had penned the famous message to the Senate from the throne, which did not scruple to imply that the murdered mother had failed in a plot against the Emperor's life and then died by her own hands in despair. It went on further to trample meanly on the memory of the fallen Queen, ascribing to her all the worst atrocities of the last reign, as well as criminal ambition in the present. This is a blot upon the character of Seneca which no apology can wipe away.—P. 138.

No statement of fact could well be more emphatic than this. Why, then, should Mr. Capes put it afterwards in a hypothetical form, by saying that, "If he penned the message of Nero to the Senate, with its attack on the memory of the murdered Agrippina, nothing can justify his conduct"? He has already shut out any doubts on the subject; and, if after such a crime the philosopher "gains in dignity and moral courage," we can but say that the process of recovery is both rapid and easy. Macaulay, then, is substantially right in his graver charges; Mr. Capes's admissions seem to show that he is not wholly wrong in his lighter accusations which relate to the practical uselessness of the Stoic philosophy. To be sure, Macaulay's remarks apply not more to the Epicurean than to other philosophical systems of the ancient world. It was not necessary that Epicurus or Zenon, Seneca or Lucretius, should be inventors of electric telegraphy or of steam-engines. The point of Macaulay's charge is that, so far as they had any influence, they diverted men's minds into a channel which made useful discoveries impossible, and forcibly kept them in that channel. Mr. Capes fully admits the truth of this charge when he says that they threw contempt on the conditions and motives which alone lead to improvements in human life and its surroundings. The vast difference between the England of Queen Victoria and the England even of George III. has been brought about wholly by a sense of dissatisfaction, or restlessness, or discontent, by a sense of want or craving, and an impatience to satisfy it—in plain English, by a dislike of certain conditions, as imperfect or evil, and therefore unsatisfactory. But, according to the Stoics, and not the Stoics only, those evils were not matters calling for, or justifying, any such feelings; on the contrary, such feelings were wrong and criminal. In Mr. Capes's words, "the paradox that pain and losses are not evils not only outraged common sense, but wrecked the motive force which was most needed for a movement of reform" (p. 176). It would be still nearer to the truth to say that no improvement whatever could be made except by bidding defiance virtually to the spirit of all these philosophical systems, which professed to impart peace to those who could crush their passions, or deaden their affections, or chill their intellects, or cast aside all thought of a creative and guiding Mind as the maker and preserver of all things.

\* *Stoicism*. By the Rev. W. W. Capes. London: Society for Promoting Christian Knowledge, 1880.

It is no small merit in Mr. Capes's method of dealing with his subject that its less attractive or more repulsive features are seldom kept unduly in the background. It is of the first importance that the reader should see clearly wherein these old philosophies failed and went hopelessly astray; and Mr. Capes has done good service by showing that the graces and virtues of the system of Seneca are really very different things from the Christian qualities which bear the same names. We hear much of Stoic humility and meekness; but he may well ask what humility must be in a system which asserted that God surpasses the good man in this only—that He is longer good, and that the good man can excel God in the patience with which he bears the trials of his mortal lot. But almost more instructive than his chapters on Seneca are his pages on Epictetus, the philosopher, not of the palace, but of the cottage. Here, again, we have a frank admission of the ingrained selfishness of the system, in spite of the seeming sympathy and tenderness which on one side can throw a certain gloss or varnish over it. His leading tenets, Mr. Capes is careful to tell us, do violence to all that we regard as noble or generous in human nature.

But there is [he adds] no trace of arrogance or affectation in himself; throughout there is a ring of genuine conviction in his words. It may move our spleen sometimes to hear a Seneca declaim in praise of poverty while surrounded by all the signs of luxury and wealth; his moral attitude at times might well discredit the fine theories about the calm of Stoic self-control. But Epictetus practised what he preached; the lame old man, for whom fortune seemed to do so little, limited his wants to the barest rudiments of food and shelter, and actually rose by strength of will and cheerful piety into a state of happiness, unclouded by the cares and anxieties of common life.—*l.* 196.

He insists indeed that there was nothing gloomy or fanatical in the ascetic practice of Epictetus, and that he did not court discomfort for its own sake. It is by comparison a small matter that his austerity, such as it was, helped to make his system unprofitable and useless for the great bulk of mankind; but for those of his readers who have not already some acquaintance with his system it would have been well if Mr. Capes had given the illustrations adduced by Epictetus for his method of attaining what he calls his imperturbability of soul. It would be no exaggeration if we spoke of them as the most heartlessly and desperately selfish of all utterances in any philosophic system, whether of the ancient or the modern world.

#### A NEW TRANSLATION OF THE DE IMITATIONE CHRISTI.\*

THE English language possesses, we believe, fewer translations than any other in Western Europe of this world-famous book. This is not very surprising when it is remembered that, what with finishing off the "Hundred Years' War" and settling their own domestic differences, Englishmen had during fifty years or so after its first appearance (supposing its usually accepted age to be correct) little chance of following the precepts of the contemplative life. Somewhere about the year 1500, indeed, one Atkinson appears to have produced, and the enterprising Wynkyn de Worde to have published, a translation; but the general direction of theological thought in this country during the sixteenth century would hardly be favourable to the popularity of a work written by a Roman Catholic divine. Before long the Bible was in everybody's hands; and without disparaging the undoubted beauty of many passages in the *De Imitatione*, or the knowledge which the author obviously possessed of many recesses in the human heart, we must concede a greater measure of both to those writers from whom, after all, he mainly drew his inspiration. *The Imitation of Christ*, moreover, would have borne a different meaning, it may be imagined, even in the mouth of either Hooker or Bunyan, from that in which it was understood by the monk of Zwolle. The most tranquil student in England could hardly appreciate, still less attain to, the depth of *recueillement* encouraged by the mediæval Roman Church. Among the host of quotations from every imaginable author, sacred and profane, which adorn Jeremy Taylor's *Holy Living*, we find one, and one only, from a source whence it might have been expected that he would borrow largely. It will be found in the section on "Humility," and is taken from the Second Chapter of the First Book of the *De Imitatione*. One is tempted to think that the good Bishop's study of the work had not at this time progressed very far, though in the *Golden Grove*, published a little later, he uses it somewhat more freely. It may be noticed, by the way, that he follows the opinion which ascribes the authorship to Gerson. Very probably he used an Italian or French edition.

In 1706 an English translation appeared, of which we know nothing but that it exists; and, to come nearer to our own times, there is a luxuriously edited version, by (of all people in the world) the bibliomaniac Dr. Dibdin, and one more adapted for use by John Payne. Until the appearance of the translation now before us, this last was the one probably most in demand among people who could not read the original, though there have been several others. It is, however, incomplete, the Fourth Book being entirely omitted; and, in point of rendering, leaves a good deal to desire, rather perhaps with regard to style and "get-up" than accuracy. It is, indeed, a remarkable testimony

to the author's catholicity of mind, that this version, though made for the benefit mainly of Evangelical readers, should adhere as closely as it does to the sense of the original. At the same time, it was obvious that a new translation was not un-called for. The taste of each generation in these matters differs from that of its predecessor; and it would have been especially strange if, in this age of translations, such a famous book had escaped the homage which is every day rendered to others of less note. Fortunately the work has been undertaken by a competent hand, and the thanks of readers are due no less to the translator for the substance of the book than to the publisher for its form. Hallam's remark of course still holds good, for those who are able to receive it, that "there seems to be an inimitable expression in the concise and energetic, though barbarous, Latin of the original"; but the structure of the sentences has for the most part been wonderfully well preserved. The principal point on which we should be inclined to suggest an alteration is in certain passages where allusion to Biblical expressions or quotation from the Bible is made. In these places, as it seems to us, the English version might have been adhered to more closely, with advantage to the English reader. Thus, in Book 1, chap. i., "Stude ergo cor tuum ab amore visibilibus abstrahere, et ad invisibilia te transferre," which is evidently suggested by 2 Cor. iv. 15, we should have been inclined to keep "things which are seen," and "things which are not seen," instead of "visible" and "invisible things." Again, in Book 2, chap. ix., we find "Hence, one said, at a time when grace was with him: In my abundance I said, I shall never be moved." Here, no doubt, the original, following the Vulgate, reads *abundantia*; but the English ear, accustomed to the rhythm of "In my prosperity I said, I shall never be removed," stumbles a little over the slight alteration in the words.

Though there can be little doubt that the author of the book was a dweller in a cloister, and that most of his precepts and meditations are suited to a secluded life, he was evidently a shrewd observer of human nature. There is, if it be not irreverent to say so, almost a touch of humour in the following passage:—

When one who often anxiously wavered between hope and fear was one day consumed with sadness, he prostrated himself in prayer in the church before a certain altar, and revolved these things: within himself, saying, Oh, if I did but know that I should persevere on and on! All at once he heard within himself the divine answer: And what wouldst thou do if thou knewest this? Do now what then thou wouldst resolve to do, and thou wilt be safe enough.

And presently, being comforted and strengthened, he committed himself to the divine will, and his anxious wavering ceased.

So true to nature is this, that it has been held, at least by one editor, to refer to one of the author's own experiences. Here is another touch, which may well have been suggested by some incident of cloister gossip, though its truth is often enough discovered in the life of the outer world:—

"Be wary," saith one, "be wary, keep to thyself what I tell thee." And whilst I hold my peace, and believe the matter to be secret, he himself cannot keep the secret which he desires me to keep, but presently betrays both me and himself, and goes his way.

For the benefit of those who may wish for a specimen to enable them to judge for themselves how the present translator has executed his work, both absolutely and in comparison with one of his predecessors in the task, we will give the last-quoted passage as it stands in the original and in the version, above mentioned, of John Payne:—

Cautus esto, ait quidam, cautus esto, serva apud te quod dico. Et dum ego sileo, et absconditum credo, nec ille silere potest quod silendum petit, sed statim prodit me et se, et abiit.

With the most solemn injunctions to secrecy, one says to me, "Be wary, be faithful; and let what I tell thee be securely locked up in thy own breast"; and while I hold my peace, and believe the secret inviolate, this man, unable to keep the secret he had imposed, to the next person he meets betrays both himself and me, and goes his way to repeat the same folly.

It will be observed that Payne sins rather by the introduction of original matter than by any want of fidelity in rendering the words of his author. Fortunately, however, a diffuse style is less in demand now than it was in the last generation.

The translator has followed common English usage in retaining the name of Thomas à Kempis on his title-page. There is an English claimant, Walter Hilton by name, a Carthusian who flourished in the fourteenth-fifteenth century, and who, long forgotten, has lately been recalled to recollection in the columns of *Notes and Queries*; but Englishmen have less patriotic interest in the debate than Frenchmen; and besides, those who interest themselves in such matters have always Junius to fight over. The only contribution which we feel inclined to make to the controversy is the remark that one at least of the reasons urged against Thomas, and in favour of Gerson—namely, the frequent occurrence of Gallicisms—is not of much weight. The book is written in mediæval Latin—i.e. a form of that Low Latin from which French itself is modified—and if we find "sufferentia" in the sense of French "souffrance," it is interesting as evidence of a stage in the history of the word, but can no more be taken as an argument for the French origin of the writer than the use of (say) the word "miscine" in the mouth of a French sailor proves that he was born in England. Italianisms, again, have been discovered by the partisans of Gerson of Vercelli. As, on the other hand, Dr. Hirsche professes to have discovered abundant Teutonicisms and a system of rhythmical arrangement almost peculiar to the works of Thomas, Kempis may perhaps cock its beaver again. By the way, last year or this should be, according to the usually

\* Of the *Imitation of Chr. A.* By Thomas à Kempis. London: Kegan Paul & Co.

received dates, the "quingentenary," or whatever the word is, of Thomas's birth. "Quæ tibi fama perit," what a chance of distinction the Kempeners have missed! But, on the whole, perhaps it is just as well that the author (or even reputed author) of the *De Imitatione Christi* has escaped becoming the theme of the Special Correspondent.

#### STRONBUY.\*

THE author and publishers of *Stronbuy* have been wise in their generation, bringing out the book on the eve of the grouse-shooting season and when the heart of many a tourist is setting towards the Highlands. And *Stronbuy* may be recommended to tourists and sportsmen, though the hanks of Highland yarn are somewhat tangled. The author has crowded his pages with a great variety of characters, so it is out of the question that he should dispense even-handed justice among them. Originals, eccentrics, and oddities predominate, as may be gathered from a glance at the illustrations, some of which are decidedly clever. Incidents by flood and fell, comic or pathetic, social, theological, and political, there are in abundance; and, with many excellent descriptions of Highland scenery, we are introduced to life in the Highlands in all its aspects. The heroes of what is rather a string of sketches than a regular story are a pair of clerks in a Government Office, who, according to the time-honoured conception of these establishments, pass their easy working hours in trifling with the *Times*. Mr. Gunter, who professes to write their experiences, and his friend, the Hon. Ted O'Halloran, are fortunate in a Highland acquaintance of generous instincts, and in a pleasant chief who is liberal of leave when propitiated by correspondence and boxes of game. As the Laird of Stronbuy happens to be going abroad, he places his mountain seat at their disposal in place of letting it. To be sure, Stronbuy might not have commanded a high rent, especially on short notice. For, though the shooting is fair, it is not extensive, and the house is an excessively modest residence, even for the lord of a barren Highland heritage. It consisted only of what is called, in Scottish phrase, "a but and a ben"—that is to say, there was a parlour at one end, with a double-bedded room at the other. Such as it was, however, it was sufficiently snug quarters for a couple of active Saxon gentlemen out for a summer holiday, and they were neither tempted to give themselves airs on the strength of their position, nor isolated from the society about them by an unlimited extent of shooting-ground. On the contrary, hanging, like Mahomet's coffin half-way between earth and heaven—between local aristocrats on the one hand and tenants and tacksmen on the other—they made friendships right and left among both. Gentlemen with deer to stalk, salmon to catch, and houses to fill were glad to welcome the agreeable Englishmen; while the Englishmen, who had few literary resources, were happy to have their nearest neighbours at Stronbuy dropping in without ceremony over a social glass. These neighbours were fairly representative Highlandmen. There were Ballachantui, Toons, and the "squatter"; the two former gentlemen taking their title from their farms; while the third, having made some money in the colonies, had hurried back to the Highlands to live upon it or to lose it. Ballachantui was big, boisterous, and sententious; often having something to say that was worth hearing, and always emphasizing his speech with expressive action. Mr. McGilp of Toons, a parish elder and a formalist, was small and commonplace, but always bringing by way of his social contribution the latest gossip current in the vicinity. The "squatter," being well educated, well read, and intelligent, plays a very prominent part in the conversations, which the author reports with considerable prolixity. As to the Factor, although dignified with that title, he was in reality a shepherd who had been advanced to the post; he was housed in a cabin standing in a "kail-yard," and was by no means above carrying the game-bags. One quality these gentlemen had in common with all the Highlanders to whom we are introduced. That was their conviviality. They were invariably ready for a dram, and could always find some fair excuse for swallowing it; and when they closed round the fire of an evening over their toddy-tumblers, they were willing enough to sit into the small hours. The "drouthy" Factor, in particular, never refused a fair offer; and his excellent wife sympathized with her husband's amiable weakness. "Ay," said the lady, "Peter likes the good dram and the strong dram. I mind Stronbuy himself getting a bottle of foreshot for the rheumatism, and he gave Peter a dram of it. 'Isn't that the best whisky, you never tasted any more, Peter?' says the laird. 'Deed is it,' says Peter, 'I feel it to be a kind of company all day wambling in my inside.' The laird, he laughed that loud, that you would have heard him on the other side of the burn." Possibly some people may think that the laird was easily amused, but we have quoted the little anecdote as illustrating the average merit of those that are scattered broadcast over the pages. For the anonymous author must be what some of his comic Celts would have called "a ferry jokey man"; and as he goes through his chapters at a handgallop, he throws off jokes to right and left, being by no means over-fastidious as to their originality. We are far from bearing him malice for that, as his uproarious merriment is often entertaining. But we are bound to remark, as conscientious

critics, that we have seldom met with more shameless plagiarizing from Joe Miller. By way of substantiating this assertion, we quote a pair of facetiæ, which are extracted from a single page in the account of a Presbytery dinner. One of the jovial company had compared the Scotch clergy to Christy Gilchrist's fleas. A much-worried traveller had expostulated with Mrs. Gilchrist on the sufferings he had gone through in the course of the night. "There's no a single flea in this house," the lady answered indignantly. "Deed I pelieve you," says he, "they are all married and have large families." The moderator, when asked whether he knew the story, had answered in the negative more politely than truthfully. And as it had been received with applause and apparently without recognition, another of the gentlemen makes even a bolder venture for a laugh. "They're telling me that's a grand sermon you hev on the prodigal," remarked a venerable doctor to a conceited young brother in the ministry. "Ay," said McTory; "I'm told he is ferry grand upon the prodigal whatever; he says he wouldn't wonder though the father kept that calf for years waiting his return." We complain the less, however, of a somewhat miscellaneous profusion of jokes, because they serve to lighten those heavier conversations to which we have referred, and which embrace a remarkable range of subjects in science, religion, and political economy. For the author aims at instruction as well as amusement, discussing, *inter alia*, the theories of evolution, the doctrines in dispute in the schools of the Scotch churches, with the arguments on the emigration that has depopulated the western glens, and on the system that has been converting sheep-walks into deer-forests.

But, although the heroes of *Stronbuy* are generally addicted to talk, they are pre-eminently men of action. And the author has very judiciously abstained from expatiating on the topics that, though they associate themselves naturally with the Highlands in autumn, have been worn somewhat threadbare by frequent descriptions. He merely touches casually, though with suitable enthusiasm, on long days devoted to the grouse, or to the play with trout, sea-trout, and salmon, afforded by loch and river. He goes at more length into the story of a day's stalking, and he tells it with considerable spirit—if the stalker had extraordinary luck for a novice—and he gives graphic pictures of the hardly less exciting sport that may be enjoyed on off-days, in favoured localities, with seal or otter. The adventure with the seals is as good a specimen of his manner of description as any other. The sportsmen, with the keepers in attendance, had walked down to a grassy bank that commanded a stretch of sea-shore and the rocks that were to be the scene of operations. "Huld on, Sandy! is no that one o' them making for the rock? Giv's them the gleeso. Ay! there's more nor one yonder. You'll see them bobbing about like the buoys that's on the herring-nets. In a quarter of an hour there'll be a good few of them on the rock." When the unsuspecting seals had settled on the rocks for a siesta, two of the men went to work at launching a boat, partly to be ready in case of need, partly with the idea of distracting the animals' attention. Then the sportsmen crawl forward over the shingle and soft mud to a rock on the beach, facing the reef in the water which is the playground of the seals; and as everything is conspiring even more decidedly in their favour than on the deer-stalking expedition, they have a quiet "pot-shot" at a couple of victims. One is killed stone-dead on the spot, the other rolls off the rock and disappears, dyeing deeply with his blood the circles made by the plunge. The Highlanders shake their heads over the chance of recovering the body; for seals, when mortally wounded, sink straight to the bottom, where they seem to wrap themselves up in the seaweed by way of shroud. But the enthusiast who fired the shot is not to be balked easily. He has learned diving from the natives on the Australian coast, and is happily as much at home in the water as the seals themselves. So down he goes, soon to come to the surface again, where he remains just long enough to provide himself with a rope. The dead animal is dragged up, and the party go home, exulting over their booty, as they well may; for shooting and securing a couple of seals simultaneously is a very rare occurrence. Independently of the shooting, fishing, and visiting, which are the normal features of the friends' life in the Highlands, they had no cause to complain of want of excitement. Their round of sports and gaieties was varied by a hotly-contested election and a grand public funeral. The late member for the county had died abroad, and his body had been sent home to be buried in state on his hereditary domains. Elections are much the same everywhere; although there are certain characteristic traits about them in the Highlands, where voters are scattered over leagues of wilderness, and have to be fetched to the polls from portentous distances in all manner of conveyances. But, if the veracity of these chronicles of Stronbuy may be trusted, a great Highland funeral must be a sight worth seeing; and its humours are set forth in an animated illustration. The procession is formed by a string of vehicles of all kinds, followed by a mixed mob of pedestrians. The piper of the departed, playing the lament, struts in advance of the bier in solemn dignity and swelling tartans; whilst a cart of provisions brings up the rear, lest any of the walking mourners should be weary or faint by the way. But there is one person who claims precedence even of the piper, and he is a mute, attired in all the gloomy pomp of rusty black, hat-scarf, and weepers. In one hand he bears a glass, in the other a bottle of whisky; and it is his function to request each person he meets to partake of the spirit as a mark of respect. We may be very sure it is a mark of

\* *Stronbuy*; or, *Hanks of Highland Yarn*. Edinburgh: Macniven & Wallace. 1881.

respect which is punctiliously paid by most of the natives. It will be seen that the contents of the volume are most various; and sportsmen or tourists who are bound for the North may do worse than include these "hanks" in their baggage.

#### AMERICAN LITERATURE.

**MR. RICHARD GRANT WHITE'S** *England Without and Within* (1) is in pleasant contrast to various books which have been written by Englishmen about America as well as by Americans about England. We find, of course, here and there a few absurd mistakes. But they are mistakes; they are due to Republican prejudices and national imperfection of knowledge, not to spite or even to the wish to be humorous. Mr. White was received with that cordial hospitality which both Englishmen and Americans are prompt to show to one another. He had introductions to the best society of the mother-country; to see the lower or lower middle class—except in railways, on the roads, or on great public occasions—he had somewhat to go out of his way. The general result of his visit seems to be a somewhat enthusiastic admiration of the best characteristics of Englishmen and Englishwomen, both those they share with and those in which they differ from his "own folk." Naturally he thinks that there is more female beauty in America; but his general estimate of Englishwomen, even on that point, will, we think, satisfy them. That in voice, in carriage, and in what we should call manners, they are vastly superior to a very large proportion of his countrywomen he sometimes asserts, and more often distinctly implies. An Englishwoman, he says, is a woman in soul as well as body, in mind as in person. Her voice is almost always pleasant, her bearing and conduct almost always free from the ostentatious self-assertion of her Northern sister; Northern, we say, for Mr. White is a Yankee, and speaks of American men and women as if he knew little of any other type. We cannot say that, in our own opinion, a Virginian gentleman or gentlewoman is wanting in any of the finest characteristics he ascribes to the aristocracy of Great Britain. According to Mr. White, a thoroughbred English gentleman is about the finest possible type of cultivated humanity. Physically, he maintains, the American is, on the average, taller and scarcely less stalwart, though the tendency to excessive stoutness is very much more rare on the Western side of the Atlantic; and certain military statistics which were published shortly after the war bear out this view. But the Englishman, he says, whether soldier or civilian, has the advantage in carriage and manner. The Horse Guards may be inferior in stature to many a regiment from Maine or Vermont—as these, we know, were to the Kentuckians—but the slouch and slovenliness of American soldiers would not be tolerated in a three-months' recruit, and is scarcely to be seen among English civilians of the higher class. But the distinctive peculiarity of England which struck him most forcibly—more forcibly than even the universal bad dressing of the ladies—was one we hardly expected to find acknowledged by an American. England, he says, is the country of rights *par excellence*, not of equal rights for all, but of rights whereof every man and woman has his or her share, and which neither the greatest individual nor the most powerful corporation can violate with impunity. In America, the convenience, the comfort—what we should call the plain obvious rights of individuals and even of society at large—are constantly trampled upon. Manufacturers, Railway Companies, rich men and rich corporations, constantly inflict nuisances upon their neighbours which in England would not be tolerated for a moment. He ascribes this in great measure to the resolute self-respect and individualism of the English character, the determination with which each man asserts his legal right, however offensive it may seem, when it is rudely invaded; while he recognizes frankly the willingness to waive rights when once properly acknowledged, without which such self-assertion would become intolerable selfishness. Whether he recognizes that such individual self-dependence and resolve is distinctly aristocratic, is the fruit of example set for centuries by individuals strong enough to hold their own against numbers, is not quite so clear. On the whole the book conveys what, we believe, is the undoubted truth. America is a far better country for those who are bent on wealth and on physical comfort that they cannot easily attain at home. For those who have enough for their wants England is incomparably the pleasanter country to live in. With all its magnificent distances, all its abundance of room, all its glorious natural scenery, America is, as compared with England, an ugly country. And in American society men are much more constantly liable to have their toes trodden upon by pushing and crowding neighbours.

The most interesting part of the Twelfth Report of the Massachusetts Labour Bureau (2) is that which deals with the subject of strikes and arbitration in American trade. Our readers are probably aware that the former have been quite as rife in some of the principal American trades as in any of our own. The crimes of the Sheffield saw-grinders fall short of the atrocities committed not very long ago by the Molly Maguires and other bands of Irish and native scoundrels in the mining

districts of Massachusetts. In reading of these we might suppose ourselves to be studying a page of Trades-Unionist history in England some fifty years ago, or a chapter of current Irish news. But in one respect Pennsylvania was more fortunate than either England or Ireland. She had a Governor and a Legislature who had old-fashioned notions of duty, who had not unlearned the effete European monarchical idea that the first office of rulers is to govern, the first consideration, when once violence has been employed, the punishment of the violent. The Pennsylvanian Government and Legislature seem to have been unanimously of opinion that no concession should be made to criminals resisting the law, at least till their crimes had been amply punished. They fancied that it was their first duty to enforce the law and protect the lives and property of law-abiding citizens. Not only did they allow troops to fire when they were fired upon, not only did they employ the most stringent measures to protect property against popular violence, but they actually hanged no fewer than twenty of the leaders. The result has been thoroughly successful. The Trades-Unionists, even while they keep up the practice of strikes and refuse to submit to any arbitration, have foregone as completely as their English congeners all pretensions to enforce obedience to their commands by criminal threats or more criminal outrages. But arbitration has seldom found favour in the States. Throughout the discussion of the subject in the volume before us we trace the influence of Protection, we see the fixed belief of the working men that they can impose a minimum rate of wages, a belief that the market price can be regulated by the producer with little reference to the means of the consumer and without fear of effectual competition.

Dr. Mathews's essays (3) are not strikingly original or especially interesting. They are, in short, as commonplace as might be expected from the author of such manuals of general conduct as the writer has previously published. They have, however, one merit which did not belong to his *Getting On in the World* and one or two of its companions; they are generally readable—if there be no more attractive matter at hand, and if the reader be content, as he probably will, with one or two essays at a time. They contain a good deal of information—not exactly curious and certainly not especially well digested—but information which is not so generally diffused as is commonly supposed; a multitude of anecdotes and ana which everybody is supposed to know, but which as matter of fact most of us have either never known or naturally forgotten, and which no doubt Dr. Mathews's readers will forget again, but which, if not exactly worth remembering, are interesting enough for the moment.

Miss or Mrs. Harriet Mackenzie's work on Switzerland (4) is not what its title-page will probably suggest. Its cover, however, warns the reader to expect neither guide-book nor description, but a contribution to Messrs. Lothrop's *Library of Entertaining History*. The adjective, perhaps, is hardly in this case deserved; but the history of Switzerland is told in a simple readable style, and in language intelligible to the youngest readers, into whose hands it is likely to fall.

Dr. Beard's treatise on American Nervousness (5) contains a vast quantity of curious and valuable medical information—information possessing an interest, altogether outside of its scientific aspect, bearing on the future of a whole race, perhaps even on that of civilized humanity, and attractive to multitudes of readers whom the distinctly medical character of the work is not unlikely to repel. That character renders it somewhat difficult to enter into detail. We may observe, however, that that decline of the native American population which has been noticed, and we think, statistically demonstrated in the case of Massachusetts and some other North-Eastern States, is, according to the author, a consequence of causes operating over the whole of the North and West, if not equally in the South. There are physical reasons, it would seem, for that dread of child-bearing which has been generally attributed to social influences, and especially to the fact that the burden of a numerous family falls so much more heavily on American than on European women of the upper and middle classes. Without referring to Mr. Spencer, Dr. Beard confirms some of the most striking and most commonly questioned of his views, but implies what would have seemed matter of course to most students of physiology, that the supposed diminution in the fertility of civilized races is due distinctly to physical deterioration, is not a symptom of stronger, more healthfully developed brain, but of nervous excitability and exhaustion. Evidently the climate of America has much to do therewith; particular districts, especially on the dry and lofty plateau of Colorado and the surrounding territories, exercising a notable influence in this respect.

We have on our list two curious almanacs, both of a semi-political character, in other respects contrasting one another as widely as well could be. The one deals with perhaps the greatest, the other with one of the very smallest, of civilized or semi-civilized States; the one with the most thriving and rising of

(3) *Literary Style; and other Essays*. By W. Mathews, LL.D., Author of "Getting On in the World," &c. Chicago: Griggs & Co. London: Trübner & Co. 1881.

(4) *Lothrop's Library of Entertaining History—Switzerland*. By Harriet D. S. Mackenzie. Illustrated. Boston: Lothrop & Co. London: Sampson Low & Co.

(5) *American Nervousness; its Causes and Consequences*. By George M. Beard, A.M., M.D. New York: G. P. Putnam's Sons. London: Sampson Low & Co. 1881.

(1) *England Without and Within*. By Richard Grant White, Author of "Shakespeare's Scholar," &c. London: Sampson Low & Co. 1881.

(2) *Twelfth Annual Report of the Bureau of Statistics of Labour*, January, 1881. Boston: Rand, Avery, & Co. London: Trübner & Co. 1881.

nations, the other with one that seems doomed, despite its exceptional assimilation of European civilization, slowly to decay and die out. The *American Almanac* for 1881 (6) is a sort of combination of *Whitaker's Almanack*, of *Dod's Parliamentary Companion*, and Martin's *Statesman's Year-Book*; in every individual point inferior to each, but on the whole affording such a compilation of American statistics and political information as is not to be obtained in any other volume of similar size. The *Hawaiian Directory* (7) is thrice as large, but is larded with advertisements, and full of a vast mass of detail interesting to no one outside of the little kingdom with which it deals, and, we should think, to very few of its inhabitants. All, however, that a directory can tell about so small a community it appears to tell; and its earlier pages contain some really valuable information, such as might possibly make it worth while to cut them out and stitch them in pamphlet form for convenient reference. The former almanac might, we think, by certain omissions, additions, and corrections, be rendered thoroughly satisfactory; might do for America all that the *British Almanac and Companion* does for a limited class of readers in this country, and *Whitaker's* for a very much larger and constantly increasing clientele.

The *Emerson Birthday Book* (8) gives an extract from that author's works for each day of the year; while on the opposite page is given a name connected with each date, from Pindar to Watt, and from Byron to Herrick. A *Lesson in Love* (9) belongs to the Round-Robin Series of American fictions published by Messrs. Osgood. Mr. McDermott's *Poems from an Editor's Table* (10) are sometimes fantastic, sometimes grotesque, and now and then, especially when the author attempts to be funny, read like absolute nonsense-velvet. The *Farm Festivals* (11) of Will Carleton is a handsome volume of a much higher quality; but we are not sure that even here the merit of the illustrations does not now and then surpass that of the text, which now and then, also, carries American humour to the point of what to English readers seems downright absurdity.

(6) *American Almanac and Treasury of Facts for the year 1881*. Edited by A. R. Spofford, Librarian of Congress. London: Trübner & Co. 1881.

(7) *The Hawaiian Kingdom: Statistical and Commercial Directory and Tourist's Guide, 1880-81*. Written and compiled by George Bowser. London: Trübner & Co. 1880.

(8) *The Emerson Birthday Book*. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1881.

(9) *Round-Robin Series.—A Lesson in Love*. Boston: Osgood & Co. London: Trübner & Co. 1881.

(10) *Poems from an Editor's Table*. By H. F. McDermott. New York: G. P. Putnam's Sons. London: Sampson Low & Co. 1881.

(11) *Farm Festivals*. By Will Carleton, Author of "Farm Ballads," &c. Illustrated. London: Sampson Low & Co. 1881.

#### NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

#### THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 58 gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

#### PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsagent in Town or Country on application to the Publisher.

Now ready, VOLUME LI., bound in cloth, price 16s. Cloth Cases for Binding all the Volumes, price 2s. each. Also Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

## ADVERTISEMENTS.

**DORÉ'S GREAT WORKS, "CHRIST LEAVING the PLATONICUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH,"** each 32 by 24 feet; with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 35 New Bond Street. Daily, Ten to Six. 1s.

**NATIONAL PORTRAIT GALLERY, South Kensington.**—Open daily, excepting Fridays, and always Free. Catalogues, Historical and Descriptive, prepared by GEORGE SCHIAPPE, F.R.S., are now ready, price 1s. Rules, for the admission of Copyists, may also be had on application at the Gallery.

**NEW ETCHING.—THE DEFENCE OF RORKE'S DRIFT,** by the celebrated Etcher, I. FLAMENG, after the picture by DE NEUVILLE. The Artist's proofs, price 10 guineas, are now ready for delivery; but few remain unsold. The Fine Art Society, 146 New Bond Street.

**CRYSTAL PALACE SCHOOL OF PRACTICAL ENGINEERING.**—The NEXT TERM opens on MONDAY, SEPTEMBER 5. 1. Mechanical Course. 2. Civil Engineering Section. 3. Colonial Section—Preparation for Colonial Life, &c. Prospectus in the Office of the Crystal Palace Company's School of Art, Science, and Literature, in the Library, next Bazaar Court, Crystal Palace.  
F. K. J. SHENTON, Superintendent Literary Department.

**GUILDHALL LIBRARY.—THE LIBRARY COMMITTEE** of the Corporation of the City of London hereby give notice that this LIBRARY will be CLOSED from Tuesday the 2nd until Tuesday the 9th August next, both days inclusive.  
Guildhall, E.C. July 27, 1881.  
MONCKTON.

**THE LONDON HOSPITAL AND MEDICAL COLLEGE.** Mid-end, E. The SESSION 1881-82 will commence on Saturday, October 1, 1881. FOUR ENTRANCE SCHOLARSHIPS, value £40, £30, £20, and £10 will be offered for competition at the end of September to new Students. Entries on or before September 20. Fees for Lectures and Hospital Practice, 30 Guineas in one payment, or 100 Guineas in three instalments. All Resident and other Hospital Appointments are free. The Resident Appointments consist of Five House-Physicians, Four House-Surgeons, and One Accoucheurship. Two Lecturers and Two Maternity Pupils also reside in the Hospital. Special entries may be made for Medical and Surgical practice. The London Hospital is now in direct communication by rail and tram with all parts of the Metropolis.  
MUNRO SCOTT, Warden.

**UNIVERSITY COLLEGE, LONDON.** The SESSION of the FACULTY of MEDICINE will begin on October 2. The SESSION of the FACULTIES of ARTS and LAWS, and of SCIENCE, will begin on October 4. Instruction is provided for Women in all subjects taught in the Faculties of Arts and Laws and of Science. Prospectuses, and Copies of the Regulations relating to the Entrance and other Exhibitions, Scholarships, &c. (value about £3,000), may be obtained from the College, Gower Street, W.C. The Examinations for the Entrance Exhibitions will be held on September 28 and 29. The SCHOOL for BOYS will RE-OPEN on September 27. The College is close to the Gower Street Station of the Metropolitan Railway.  
TALFOURD ELY, M.A., Secretary.

**OWENS COLLEGE, MANCHESTER.** BISHOP FRASER SCHOLARSHIP. £40 per annum, tenable for two years. The first competition for this scholarship will take place about October 11 next. Candidates must not be more than Twenty years of age on October 1 preceding, and must have previously passed the Preliminary Examination of the Victoria University, or the Matriculation Examination of the University of London in June 1881. The Examination will be held in Classics and Ancient History. The Scholar will be required to enter on a Course of Study at Owens College with a view to a Degree in the Classical Honours School of the Victoria University. Further particulars may be obtained from the Registrar.  
J. HOLME NICHOLSON, Registrar.

**OXFORD MILITARY COLLEGE SCHOLARSHIPS.** SIX SCHOLARSHIPS, Two of £75 a year, Two of £50, and Two of £30, will be offered for Competition on September 6 and 7. Names to be sent before September 1 to the HEAD-MARTIN, Military College, Oxford, from whom particulars may be obtained.

**BRIGHTON COLLEGE.** Principal—Rev. T. HAYES BELCHER, M.A. Queen's College, Oxford. Vice-Principal—Rev. J. NEWTON, M.A. St. John's College, Cambridge. The NEXT TERM will commence on Tuesday, September 26.  
F. W. MADDEN, M.R.A.S., Secretary.

**BATH COLLEGE, BATH.**—The Next Term will commence on Saturday, September 17, 1881. Head-Master—T. W. BURN, Esq., M.A., late Fellow and Assistant-Tutor, St. Peter's College, and for ten years a Master of Clifton College.

## AFGHANISTAN.

THE victory of Kareez-i-Atta has been followed in the natural course of things by the occupation of Candahar, and AYUB KHAN is now master of the city and territory from which, at the cost of a great humiliation and of much blood and treasure, he was last year excluded by England. The experiences of that campaign would have taught a prince possessed of much less military capacity than AYUB has shown the value of time, and, whatever his ultimate object may be, it may be taken for granted that he will pursue it without delay. Whether or no he advances on Cabul will probably be decided by the attitude of the Ghalzais, as to which there is no authentic intelligence; but that Southern as well as Western Afghanistan is lost to the AMEER may be taken as much for granted as anything in the kaleidoscopic regions of the East can be. There is no difference of opinion as to the immediate necessities which this event imposes on England. After the conduct we have pursued to fight AYUB in the interest of ABDURRAHMAN would be simply ridiculous, and only one degree more out of the question than to fight ABDURRAHMAN in the interest of AYUB. The great present harm is that the nominee of the English Government is beaten and the enemy of the English Government triumphant. For the future two things appear possible, either that ABDURRAHMAN will willingly or unwillingly give up the game altogether (in which case every Afghan and most inhabitants of Hindustan will regard AYUB as having forced his way to the throne in defiance of England), or else that a partition will be effected. This partition means that there will always be at least one potentate in Afghanistan eager for foreign help and quite indifferent to the quarter from which that foreign help comes, and that the holder of the northern provinces will be practically as much a Russian vassal as the Khan of Bokhara. It is difficult to conceive how either of these consummations can be wished by any Englishman who is not either totally ignorant of the facts or blinded by prepossessions in favour of some particular theory.

The persistence with which all Afghan and Central Asian affairs are looked at, either from a party point of view or from the point of view of the prepossessions just alluded to, is a matter most profoundly to be regretted. The first impulse, for instance, of all the English Government journals on the arrival of the news of Kareez-i-Atta was one of childish self-defence. "It does not matter to us; it has nothing to do with the evacuation of Candahar; if it does matter and has something to do, it was your fault for ever beginning an Afghan war." There can be few things more lamentable than this way of looking at questions which involve grave national interests. As a matter of fact, nothing is easier than to show that the mistake—to grant that it was a mistake—of the quarrel with SHEER ALI has no more to do with the present situation than the original misconduct of ADAM or NOAH. Reasonable politicians have nothing to do with anything save immediately accomplished facts. The accomplished facts in this case are the disorganization of Afghanistan, the invasion of AYUB last year, the encroachments of Russia in Persia and Turkestan, the evacuation of Candahar. To go behind these may be very well worthy of a political philosopher or an historical student, but is altogether idle and absurd for a statesman. There are the facts with which we have to deal; the cir-

cumstances under which we have to act. Nor is it possible for all the audacity of partisanship, backed by all the ignorance of Eastern affairs, too common among English statesmen and journalists, to deny the two following propositions:—First, that the battle of Kareez-i-Atta is a bad thing in itself for England, and a worse thing in its probable consequences; secondly, that but for the evacuation of Candahar the battle of Kareez-i-Atta would never have happened. The second proposition even ignorance and audacity combined have not ventured to deny; the first has been sufficiently established by the remarks already made. No reasonable person advocates a fresh plunge at this moment into Afghan affairs; no one who is not possessed of a great deal of courage can assert that Afghan anarchy and Russian advances together make up a combination favourable to the future peace of India.

It is at least satisfactory, in the midst of many things that are not satisfactory at all, to take note of Lord HARTINGTON's observations as to the present state of Central Asian affairs. Lord HARTINGTON has, in some ways, disappointed observers of his political career, and it is by no means too certain that he possesses that knowledge of Asiatic affairs which his position demands. But he has plenty of common sense, and he is, on the whole, trustworthy. It is not forgotten that when Sir CHARLES DILKE made his famous and hopelessly delusive statement as to the intentions of Russia in the Candahar debate, Lord HARTINGTON poured cold water on his colleague's enthusiastic imagination, and went as near as politeness and expediency would permit to repudiating his words. The very frankness with which the Indian Secretary announced from the first that the Government did not care to hear or mean to hear reason about Candahar had something refreshingly straightforward about it. In replying to Mr. ASHMEAD BARNETT on Monday night, Lord HARTINGTON made a statement which was of some gravity. It has more than once been remarked how unlucky it is that public questions of great importance should fall into the hands of private members who, excellent as may be their intentions, fail somehow to convey to the House a sense of that importance. Mr. ASHMEAD BARNETT's speech on this occasion, whatever its merits may have been, contained a very great deal of matter which was well worth the attention of the House. The House, however, would not attend to it, and Lord HARTINGTON's task was easy. Had Sir CHARLES DILKE been the respondent, he would probably have confined himself to availing himself of this want of attention and fencing the question. Lord HARTINGTON, however, while making some fair personal and political points, spoke with unexpected gravity on the recent and threatened Russian encroachments on Persia and Afghanistan. The out-and-out asserters of the principle that nothing which happens in Central Asia concerns Great Britain must have been a little disconcerted at Lord HARTINGTON's plain statement that the Akhal annexation was not a matter of indifference to the Government; that the question of the integrity of Persia is still less indifferent; that an advance of Russia towards the borders of Afghanistan "might not be of advantage to the good relations of Russia and England"; and that the whole subject was under the consideration of the Government. This, translated out of Ministerial and party language, more than justifies what has been said by the Jingoes, the alarmists, the Mervous persons, at whom certain political partisans are never tired of sneering. It would be, of course, too

much to expect that Lord HASTINGTON should admit that at least some of the things the gravity of which he so fully admits are the obvious and direct consequence of the evacuation of Candahar. It would be still more unreasonable to expect that he should trace the new Afghan trouble to the same source. Nevertheless, that the evacuation was as much the direct cause of these events as the battle of Sedan and the siege of Metz were the immediate cause of the subsequent events of the Franco-German war is simply certain. It was because these results were clearly foreseen, and for no other reason, that the evacuation was objected to in these columns. It seems absolutely impossible for some persons to dissociate the question from abstract theories as to the best frontier of India, absolutely impossible for others to dissociate it from political prepossessions about the conduct of Lord NORTHBROOK or Lord LYTTON. Both these proceedings are merely examples of the apparently incurable habit of looking at anything rather than the facts. Those who did look at the facts can at any rate assert, without fear of contradiction, that everything has happened exactly as they predicted.

#### ENGLAND AND AMERICA.

IT is uncertain whether the English and American Governments have entered into any correspondence on the subject of the murderous Fenian plots. The object would perhaps be more effectually attained by semi-official representations than by formal exchange of despatches. The discovery of the infernal machines which were landed at Liverpool a few weeks ago seems to have produced a considerable impression in the United States. Respectable journalists have ceased to sneer at the supposed suggestion that the Federal or State Governments should "do the police work of England." It is not the business, nor is it within the power, of the English police to deal with preparations for murder which may be made on American soil. It is possible that there may be no sufficient legal remedy, for it is only within a few years that the atrocious doctrines of Nihilists, Fenians, and other gangs of assassins have been openly professed or even suspected to exist. It assuredly is or ought to be a crime of the greatest magnitude to employ the resources of mechanical skill and chemical knowledge to the production of machines for the express purpose of destroying persons who are probably unknown to the artificer. The ruffian who lately boasted that his accomplices had blown up in the *Doterel* an unoffending ship's company, has since informed a newspaper writer, who was not ashamed to converse with him, that he would not think of causing an explosion in an Atlantic steam-packet which might have some of his own friends on board.

The efforts which have been made to trace the consignors or manufacturers of the clock machines seized at Liverpool have not been successful; for it is impossible to say whether the braggart statements of wretches who profess to be engaged in the manufacture of murderous implements have any foundation in fact. The inspection at the outports has probably become more minute. There was nothing in the appearance of the casks which contained the machines to excite suspicion; and it is probable that the merchandise was entered by the freighter under a fictitious name. The English authorities are not entitled to charge the American police with inefficiency. It seems to be impossible in England to keep secrets, even of the most vital importance. Newspaper agents pay high for intelligence, and some official of the humbler class appears always to be open to a bribe. There is something cynical in the uniform readiness of editors to publish news, even at the risk of thwarting the national policy or of preventing the discovery of crime. Three years ago a paper, friendly to the Government of the time, caused the Ministers the gravest embarrassment by printing a secret despatch which had been stolen by an occasional clerk from the Foreign Office. In time of war English generals have now, in addition to their other arduous duties, to keep watch over the Correspondents, who are always ready to disclose to the enemy through the press the most important information. It seems that the Government and the Liverpool magistrates were, with good reason, anxious to keep the secret of the importation of infernal machines as long as there was a hope of discovering the guilty consignee; but by some unknown channel the secret leaked out, and, as soon as the whole story appeared in the newspapers, all hope of a discovery was at an end. The HOME

SECRETARY was compelled to admit the truth of published statements which had already done all the mischief possible. While the matter was in the hands of the police, it is difficult to understand why the barrels were removed, instead of being left in the ordinary course of business to await the demand of the consignee. The inveterate sympathizers with revolution, who habitually vindicate or extenuate the outrages of the Land League, and who are consistently anxious to exonerate the closely allied Fenian conspirators, affect to believe that the infernal machines were made and sent for the purpose of producing alarm rather than of causing murderous explosions. A less skillfully constructed and less costly engine would have served the purpose. It is true that a main object of the conspiracy is to create terror; but one explosion would frighten timid politicians more than a dozen abortive attempts. By violence, or the apprehension of violence, the trustees of the Skirmishing Fund hope to bring the separation of Ireland from England within the range of practical politics. Their hopes will have been encouraged by Mr. GLADSTONE's recent declaration that a discussion on the concession of Home Rule was merely inopportune.

In the present temper of the American people, the police may be trusted to exercise reasonable vigilance for the prevention of shipments of explosive materials. There is, on the other hand, little reason to hope that the authorities will interfere with the incendiary publications which both aid in the collection of funds for the Land League and announce that the independence of Ireland will be best attained through the use of dynamite in England. A wholesome jealousy of interference with the free expression of opinion is combined in the United States with a national tendency to strong and inflated language. Public speakers who would not willingly be held responsible for the literal meaning of all their rhetorical flourishes read even the most violent language with a tolerance which is founded on a latent suspicion that it is insincere. Although Fenian exhortations to crime have again and again been followed by fresh outbursts of villany, American politicians are loth to connect the result with the cause. Some apologists for inaction remark with truth that the literature of assassination is not studied by respectable citizens, who, indeed, might read the *Irish World* without the smallest risk of their becoming accomplices in crime. The preachers of murder ought to be restrained, if only for the reason that they address actual or potential murderers. Although Fenians and Nihilists would not be admitted into respectable private society, they are personally regarded with a tolerance which seems to Englishmen strange. The would-be regicide HARTMANN, whom Mr. BIGGAR held up as a model to be imitated in England, seems to be openly agitating in the United States. O'DONOVAN ROSSA announces that he will wait on the PRESIDENT after his recovery, and that he will appeal to the sympathies of Congress. It is not forgotten that some years ago Fenian delegates were formally received by the House of Representatives.

The English Government has acquired a right to protest against unlimited license of publication by the remedy which was after the ORSINI attempt applied to a defect in the law. The prosecution and conviction of the incendiary MOST proved that it was legally possible to comply with the requirements of international comity; yet it is impossible to compel the Americans to provide security against incitements to murder. If Lord GRANVILLE has suggested to the SECRETARY of STATE remedial legislation, he must acquiesce in the refusal which will probably be given. Further pressure would only cause popular agitation; and dislike to the pretensions of England would in some cases take the form of sympathy with the promoters of assassination. English Governments have often in not dissimilar circumstances given offence to Continental rulers. A nation which never attempts to protect its own highest functionaries from vituperation and calumny is naturally indisposed to legislate for the benefit of foreigners. At the present time it is especially desirable to abstain from proceedings which might cause a reaction against a spontaneous movement in the right direction. The crime of GURTEAU has caused not only general reprobation of political murder, but a strong disposition to trace the outrage to its causes. Although GURTEAU is an isolated offender, and not the agent of any faction, a strong impression prevails that he might, perhaps, not have ventured on his enterprise but for the violent attacks which had been lately made on the Paris-

ment by a section of the Republican party. It matters little for the present purpose whether the conjecture is well founded. The existence of the suspicion proves that those who share it have learned to understand the connexion between inflammatory words and criminal acts. A Russian regicide could not have chosen a more inauspicious occasion for his visit to the United States than at the time when the PRESIDENT has not yet recovered from the wounds inflicted by an American HARTMANN. The distinction between Kings or Emperors and Republican Presidents has been obliterated by the hand of GUITEAU. The universal indignation which was felt in England on the perpetration of the crime may perhaps strengthen the growing disposition in America to discourage murderous conspiracies. A continuation of the outrages perpetrated and threatened would produce a feeling against Irish residents in England which might have serious consequences. The mere habit of blustering about crimes of the worst description is in a high degree demoralizing. For the distress and alarm which must necessarily be caused by even vague threats of assassination, the miscreants of the Fenian press and the Skirmishing Fund have no consideration.

#### THE LAND BILL.

IT would be interesting to know what were the real thoughts of the noisy partisans who have lately been threatening and abusing the House of Lords as they read the debates on the second reading of the Land Bill in the Upper House. The remarkable advantage in point of business-like aptitude, no less than of intellectual and oratorical ability, which the present House of Lords has over the present House of Commons could hardly have been better shown. In the protracted debates on the Bill in the Lower House a singular reluctance or a singular inability to display anything like a grasp of the measure has prevailed. On the Opposition side, Mr. GIBSON, Mr. SMITH, and, in a less degree, Mr. PLUNKET, fought the losing battle with remarkable ability and perseverance; but on the side of the Ministry there seemed to be a *mot d'ordre* that no one but Mr. GLADSTONE was to say anything of importance. Whether the principle was the same as that which precluded loyal subjects in old days from unmannerly interference with their sovereign's pleasure and prowess in the chase, or whether the silence resulted from that secret dislike to the measure which, as Mr. SMITH assures his constituents, prevails as much on one side of the House as on the other, it is impossible to say. But the fight was as languid as it was long. Great praise has been given to Mr. GLADSTONE's conduct of it, praise which is perhaps rather more generous than discriminating. That conduct brought to mind forcibly a rule of the game of whist, which will be sought in vain in the code of Messrs. CLAY and BALDWIN, but which is said to prevail in some Continental regiments. At each deal the colonel names trumps after looking at his own hand. Mr. GLADSTONE's enormous and obedient majority gave him a somewhat similar advantage in proposing, dropping, adding, and altering the provisions of the Bill exactly as might best suit his convenience or his wishes. The energy which enabled a man of his age, burdened with much other work, to go through such weeks of labour, can hardly be too much admired. But conduct and generalship were hardly needed. The House of Commons with which Mr. GLADSTONE had to deal would have passed the Koran or the Nautical Almanac as a Land Bill if he had bidden them to do so, and the knowledge of the fact naturally took all spirit out of the unreal fight.

It has been insinuated that the battle in the Lords was equally, if not still more, unreal, and that the brilliant speeches of Lords SALISBURY, LANSDOWNE, CAIRNS, and the Duke of ARGYLL were mere beatings of the air—elaborate arguments for rejection, winding up with a lame and impotent conclusion of acceptance. That nothing can be further from the truth is sufficiently obvious. The Peers are statesmen, if their critics are not, and they have to consider the consequences of their action. The proved unwillingness or incapacity of the Government to deal with Irish anarchy throws a frightful responsibility on those who give them the occasion of once more displaying that unwillingness or that incapacity. It would be the duty of the Peers not to shrink even from that responsibility, if there were the slightest chance of pending matters.

There can hardly be said to be that chance. The state of terror in which the Whig members of the House of Commons are held has been sufficiently proved, and the general attitude of the country toward the Bill is one of sullen and unfriendly acquiescence. The commonplaces of demagogues have such a mischievous charm in them, that, in case of a general election being held to decide between the Lords and Mr. GLADSTONE, it is by no means sure that unintelligent resentment at the interference of the Peers might not confirm the tottering allegiance of the majority of the constituencies to the present PREMIER. The possibility of a dangerous agitation in England as well as in Ireland is therefore involved, and unfortunately the proof that there are persons of the highest position ready to avail themselves of any such agitation is recent and unmistakable. There is, therefore, nothing to do but to shorten sail and wait for better weather. For it must be remembered that, unlike most so-called reforms, the Land Bill is in its nature a step backwards, not a step forwards, and as such is retrievable. In the very possible contingency of its landing Ireland in a deadlock of litigation, rack-rent, and economical entanglement, a return to the Saturnian principles of free contract and common sense may be as ardently desired by the next generation of tenants as a departure from those principles is desired by the present. Every successive change in social and commercial relationships which has ever been permanent has been in one direction; and there is no reason for believing that Mr. GLADSTONE will be any more able to mop back the ocean than any one of his illustrious predecessors in the attempt.

This being the case, it may be hoped that the wisdom which has already furnished a clear and exhaustive criticism of the measure as it stands will leave it to work weal or woe unhampered and un mutilated. All that needs to be done is to redress the most obvious and definite injustices and inexpediencies. There is no need to go the cynical length of advocating the retention of the worst parts of the Bill in order that it may do as much harm as possible. Some amendments are not merely legitimate but necessary. The propositions of Lord SALISBURY, of Lord CAIRNS, of the Duke of ARGYLL, and, in a somewhat less degree, of Lord LANSDOWNE, show a complete comprehension of the situation, and would go far towards making the measure an economical experiment rather than a simple carrying out of the motto "Stand and deliver." Lord CAIRNS's amendments, in particular, show that knowledge of the facts of Irish land-holding which is not denied even by the most hostile critics, and which in the Lower House was notoriously not possessed by a single influential member on the Government side. Lord SALISBURY's deal rather with such defects as are obvious on the face of the Bill. The Duke of ARGYLL's are the most drastic of all; and it is perhaps not superfluous to point out that the Opposition cannot be fairly charged with any difficulty that may arise from them. But the Duke of ARGYLL's improved form of Mr. HENEAGE's proposal, and of the proposal for protecting those landlords who have bought up the tenant-right; Lord CAIRNS's check on collusive sale; and Lord SALISBURY's removal of the present limitation on the landlord's right to go into court—a limitation as contrary to public policy as to justice—are all of the class of amendments which the Lords may justly insist on. Hardly as much can be said of the omission of the words specifying the two interests in Clause 7, for those words, objectionable as they are, are of the essence of the Bill. On the other hand, the Opposition were wise in refusing to introduce the comparatively unimportant, and probably vexatious, restriction for which Lord EDMUND FITZMAURICE had stood sponsor in the Lower House. There are some minor points, moreover, in which the known business ability of the Upper House may fairly set straight things left crooked and tangled by the complication of amendments of insertion and omission which takes place in Committee of the House of Commons. That there is room for such improvement even in the opinion of the Government, is evident from the numerous amendments which stand in the name of the LORD PRIVY SEAL. But it seems of vital importance that the alterations made should be kept down as much as possible. To speak the plain truth, it is the principle of the measure, and not its details, which is objectionable and dangerous. If it is necessary, as it certainly is necessary, in the public interest to swallow

the camel of the three F's, it is idle to strain at gnats in the shape of years and pounds, rights of turbary, and rights of digging for minerals. In the same way it may be argued that the hands of the Court should be left as free as possible. No conditions which can be inserted in the Bill as it stands will prevent the Commissioners, if they are prejudiced, from giving effect to their prejudice, and none are necessary if they are not so prejudiced. On the whole, it would be impossible to define the difference between wise and unwise amendments better than was done by Lord CAIRNS at the conclusion of his admirable speech. This is not a case where it is wise to ask for more than the asker is prepared to take. The amendments which the Lords determine on introducing should be few, should be clear, should manifestly not run contrary to the general principles of the Bill, should be such as are obviously required by the plainest reasons of justice and expediency. That there is room for amendments of this kind is certain, and the Peers will be supported by public opinion in proposing them. Most of the alterations which have hitherto been carried seem to keep this principle in view very fairly. But to "potter" with the Bill is in every way undesirable. The sooner it is allowed to go its way, and the more thoroughly it is allowed to do its work, the greater will be the chance of the people of England opening their eyes to its real meaning. Nor should the renewed agitation in Ireland be left out of the question. "The Moors have heaven and me," says ALMANZOR. The Peers have the laws of the universe and Mr. PARNELL. At present the member for Cork is playing their game vigorously; it would be a thousand pities if they by any mistake should play his.

#### EUROPEAN COMBINATIONS.

EXPERIENCED observers of political affairs pay little attention to rumours of constantly shifting combinations supposed to be arranged among the Great Powers. When at long intervals alliances are made for purposes of aggression or defence, positive compacts sometimes modify the policy which would be in any case pursued; but, on the whole, it is the safest course to assume that every Government will be guided by considerations of its own special interest. Apparently authoritative statements which contravene the general rule almost always prove to be erroneous. A few months ago the determination of Greece to go to war with Turkey for the frontier defined by the Berlin Conference was affirmed by an overwhelming mass of respectable testimony; but the sceptics who declined to believe that so gross an act of folly would be perpetrated found their calculations justified by the result. The same test may be advantageously applied to the diplomatic activity of more important States. Governments which have for the time nothing to gain by an adventurous policy are not likely to entangle themselves in alliances for facilitating aggression. The League of the three EMPERORS which was at one time actually established was accepted by Germany for the purpose of preventing an understanding between Russia and France which might have become dangerous. Nevertheless, after the lapse of three or four years, the League was tacitly dissolved, notwithstanding the dynastic intimacy which united the Courts of Berlin and Petersburg. When Prince GORTCHAKOFF seemed disposed to resent the secession of Germany from the League, Prince BISMARCK at once formed a more natural, and apparently a more permanent, alliance with the Austrian Government. The close union of the two central Empires is the best guarantee for the peace of Europe; and consequently any change in the present arrangement would cause general uneasiness. There is no reason to fear that the allies will voluntarily engage in a war of conquest. It is strange, but true, that no other combination among Continental States would be deemed equally innocuous.

Alarmists, if the name may be applied to habitual prophets of evil who are not always mistaken, have lately discovered or suspected a meditated adhesion to the alliance of Austria and Germany on the part of France. Such a combination would undoubtedly justify the anxiety which a belief in the rumour would create. At present the story rests on no sufficient evidence; and it is in itself highly improbable. The origin of the report may probably be traced to the approval or indifference with which Prince BISMARCK is known to have regarded the French

attack upon Tunis. It may perhaps have been a mistake to have felt complacent satisfaction at the engagement of French forces in a remote enterprise which threatens no German or Austrian interest. To other politicians the temporary withdrawal from adventurous undertakings of the Power which has for centuries been the most turbulent in Europe had seemed a ground for unqualified satisfaction. That French vanity should once more have been aroused by a trivial conquest is not an insignificant fact; nor can the wisest statesman foresee the results of the complications in which the French Government is already involved. In the first instance, England, Italy, and incidentally Spain, have been the only adverse critics of the policy which M. ST-HILAIRE has alternately disavowed and defended. It is not Prince BISMARCK's habit to interfere with quixotic generosity for the protection of the interests of other States. A coldness between France on one side and England or Italy on the other would perhaps not be unwelcome to the German Government. It is not probable that any French Ministry would begin to extend the national territory in Africa, if it had any immediate purpose of attempting the recovery of Alsace and Lorraine. There is a wide interval between acquiescence in the African aggrandizement of France, and complicity in projects for disturbing the peace of Europe.

A newspaper Correspondent has lately taken the simplest method of gratifying public curiosity by seeking interviews with Prince HOHENLOHE and M. GAMBETTA, and asking them whether a tripartite alliance has been formed or contemplated. Statesmen in modern times are not in the habit of expressing surprise at such inquiries; but they exercise their diplomatic skill in giving as little information as possible, except when publicity serves their own purpose. The interview with Prince HOHENLOHE led to the important statement that such an arrangement was possible, but that, if it had been made, it was still a secret. An indefinite answer was the best way of dealing with an impertinent question. M. GAMBETTA was so far more communicative that he repudiated any knowledge of the ruptured compact; but he was not less mysterious than the German Ambassador in giving his opinion as to the probability of an alliance. Even his disclaimer of knowledge of the fact was qualified by the statement that he seldom saw the FOREIGN MINISTER, though he admitted that the alleged transaction could scarcely have occurred without being brought under his notice. The journal which represents his opinions has since made a violent and scornful attack on M. BARTHÉLEMY ST-HILAIRE. Some of M. GAMBETTA's further remarks were not uninteresting, though they contained no special information. An alliance, as he justly remarked, would only be made for the furtherance of some policy in which the three Powers were jointly interested. A chronic or permanent alliance by which the independence of French policy would be limited seemed to M. GAMBETTA neither desirable nor probable. The sound distinction which he draws would account for the uneasiness which the rumour has caused to those who believe it to be true. A confederacy of Germany, Austria, and France will never be formed for peaceable or defensive purposes. The conclusion of such an alliance would imply a foregone determination to engage in some aggressive undertaking. On the whole, and as a general rule, M. GAMBETTA desired to retain for France entire freedom of action, with the contingent advantage of being ready to profit by any opportunity. His further expression of a belief that international policy would hereafter be regulated by the concert of Europe, seems, if it is correctly reported, to be incompatible with his system of political independence. Whenever the Great Powers, or some of them, fall out among themselves, the concert of Europe, which principally affects minor States, is for the time suspended.

The frequent complaint of the isolation of England represents, as far as it is well founded, the inevitable result of well-known circumstances. In the late Turkish negotiations all the Powers co-operated harmoniously with England. It is only when questions of territorial readjustment in the heart of the Continent occur that the wishes of England are likely to be left out of consideration. A Power which always desires peace is not a probable ally in the prosecution of ambitious designs, nor are the comparatively small military resources of England forgotten by potentates who dispose of gigantic armies. It is indeed not a little surprising that the Power which is both most unwilling to disturb

the peace and least capable of engaging in wars of conquest is treated with the deference which English Ministers still command. It is impossible to regard with satisfaction the unstable equilibrium of European peace. There was far more security against war during the forty years which followed the fall of NAPOLEON. In the early part of the time the half-fabulous Holy Alliance was too much disposed to interfere for the suppression of popular revolutions. The French invasion of Spain in 1823, and the previous occupation of Naples by Austrian troops, were in themselves wrongful acts, but they led to no serious disturbance of the general peace. It was understood that a majority of the Great Powers would combine against any one of their number who should disturb the existing settlement. In 1840 Lord PALMERSTON effectually checked the ambitious projects of France by uniting the other five Powers in opposition to M. THIERS's Eastern policy. The place of the old European concert is inadequately filled by temporary combinations which are at all times liable to be disturbed. The tribunal of the Great Powers has not ceased to exist, but its functions are changed, and it confines itself to such operations as the settlement of frontiers between Turkey and Montenegro or Greece. The principal security against war is now the enormous cost in men and money of military operations. The masters of colossal armaments are afraid to set them in motion.

#### EGYPT.

SIR CHARLES DILKE, in answer to a question put by Lord BECTIVE, stated that the English Government had received no application from the KHEDIVÉ for assistance in case of a revolt, and that, so far as was known in London, no such application had been made to the French Government. That there should have been any occasion to ask such a question would seem extraordinary to any one who had not followed the recent course of Egyptian history. To those who have followed it nothing could seem more natural than the question of Lord BECTIVE. There is some danger of a revolt in Egypt, and if the revolt broke out, it would be of a kind which it would need aid from without to suppress. The Egyptian army is in a very disorganized state; and, if its want of organization went a little further, it might cease to be organized at all, and become a band of disaffected insurgents. That an army should get out of hand, and be ready to turn against its nominal employers and chiefs, is a serious thing in any country. But in Egypt it would be a very serious thing indeed. For in Egypt there is not the smallest element of resistance to a disaffected army. There is the KHEDIVÉ, and a few foreign Pashas, and a population which would not stir a finger to protect itself, or its country, or its Sovereign. There is a sprinkling of foreign residents, all civilians, full of jealousies and suspicion as regards each other, and without any common centre, tie, or principle of action. There is nothing like an army within the army, a portion of the military force that can be set against the rest, faithful regiments ready to share the fate of their master, like the Russian regiments who saved the dynasty at the time of the accession of NICHOLAS. The KHEDIVÉ has no Janissaries, and it is doubtful whether he has even a bodyguard whom he can trust. If the army revolted, it would probably revolt in a body, and would do whatever its accepted chief or chiefs told it to do. It might in a few days make itself master of the whole country without a struggle. It only consists of about fifteen thousand men, and neither the private soldiers nor the officers have any knowledge of military matters or any experience of war. But fifteen thousand men, with arms in their hands, compose a powerful force when no one else is armed, and it does not require much military knowledge to threaten or shoot down people who do not and cannot resist. A military revolt in Egypt would have as certain a prospect of success as the instigators of such a revolt could wish for, if they had only Egypt itself to think of. But those who might be inclined to head such a revolt know that they have not only Egypt to think of. Punishment might come from London or Paris or Constantinople, but it would come from some quarter outside Egypt, and sooner or later they would themselves be shot, and, therefore, all things considered, they do not think it worth while to revolt.

But recent events have shown that there are at present grave reasons for regarding the Egyptian army with

anxiety. These reasons go back for some distance of time. The present KHEDIVÉ has now been just two years Khedive, and he was made Khedive because the protecting Powers got his father deposed, and ISMAIL was deposed because he set himself to shake off the Protectorate, and the beginning of his attempt to make himself independent was his getting rid of the NUBAR-WILSON Ministry by rousing his soldiers against them. The soldiers had something substantial to complain of, for they had received no pay for nearly two years; but they would have borne their hard lot with the habitual submissiveness of Orientals, had it not occurred to ISMAIL that they might be used to free him from a Minister who, in his eyes, was the symbol of foreign supremacy. It was suggested to the soldiers that it was NUBAR PASHA who was keeping them out of their pay, and giving to foreigners what was due to them. They mobbed this treacherous Minister, and then the KHEDIVÉ, instead of upholding the man whom he had entrusted with authority, coolly observed that the incident showed that NUBAR had not the confidence of the population, and that he, as the father of the country, could not keep in office a Minister whom the country wished to see dismissed. A vivid sketch will be found in Mr. DICER's volume of the long-suffering or meekness with which the protecting Powers accepted this deliberate challenge of their authority. Scene after scene succeeded, interesting enough, but mostly with an interest of a comic kind. At last the KHEDIVÉ was deposed, and accepted his deposition like a lamb. Even had he wished to resist, he could not have relied on his army. It is a peculiarity of the Egyptian army that it is never of any use to any one. It had just renewed its oath of fealty to him when he was deposed, and with perfect indifference it renewed its oath of fealty to his successor. Things got better in Egypt, and means being found to pay the army, everything went on pleasantly till the early part of this year, when the Egyptian officers thought that they would like to improve their position, and asked for the dismissal of some Turkish and Circassian officers, to whom, as they alleged, all the best things were given through the favouritism of the Court. Three of the ringleaders were arrested, and then the regiments with which they were connected marched to the prison where these officers were confined, released them, and, finding no one to oppose them, began to instruct the KHEDIVÉ as to what he had got to do to content them. They did not, however, begin with the KHEDIVÉ, but with the French Consul, M. DE RING, who, in a vein of effusive good-nature and lordly superiority, treated them as the best of injured men, threw over his English colleague and the KHEDIVÉ, and told them all the great things he, as representing their true friend France, would do or get done for them. For this monstrous piece of indiscretion he was subsequently recalled by his Government. Mr. MALET, the English Consul-General, behaved in these difficult circumstances with much firmness and discretion. He would do nothing apart from the KHEDIVÉ, but in conjunction with the KHEDIVÉ he got the men to make a nominal apology, and to say that they would trust the KHEDIVÉ to redress any grievance of which they justly complained. But they had tasted power, and could not get the taste out of their mouths. Since then the army has asked and obtained one concession after another. It asked that the Minister of War should be dismissed, and he was dismissed. It asked for higher pay, and got it. It then asked that it should be allowed to elect its own officers, and even this astonishing demand, which brought to an end anything like discipline and control, received a humble assent. It seems to have now taken into its head that it would like to recast the Civil Service, so as to place tame and numerous people in a proper degree of subordination to the gallant defenders of their country. The army is, in fact, within a point or two of governing Egypt. It has asked and got so much that it sees no limit to what it may get further by asking.

When an army gets into this state of anarchy, there is no effectual remedy except to disband it. Egypt has no occasion for an army at all. What it wants is a small, effective *gendarmérie*. Much money would be saved to Egypt, and a source of serious danger to the KHEDIVÉ and the country averted, if the army altogether ceased to exist; and, as there is probably not a soldier in the army who has not been made to serve by being torn away by force from his village, the men might be not unwilling to go

to their homes. But they are very unlikely to go quietly if they are made to go; they will probably follow their officers blindly, and the officers are very much interested in not allowing the army to be disbanded. How, then, is the disbanding of the army to be begun, and still more how is it to be finished? An army flushed with repeated triumphs, and having put the weakness of the Government to tests of increasing cogency, is not to be dispersed unless there is some one to say that it must go. In Egypt there is no one who can say this. The KHEDIVÉ cannot say it, the Ministers cannot say it, and the English and French Consuls-General cannot say it. An English or a French sergeant, with a dozen of his own men at his back, could say it, and the Egyptian army might melt away in a day. But there is no English or French sergeant in Egypt, and the KHEDIVÉ and the English and French Governments are equally reluctant to allow these forerunners of foreign armies to appear. If the KHEDIVÉ applied for military assistance to the protecting Powers, he would bid farewell to the possession of that fraction of independence which he retains, and to those hopes of a much larger measure of independence which he is known, or, at least, is commonly believed, to cherish. Neither the English nor the French Government would allow troops to be sent by the other without insisting that troops of its own should go too. A joint military occupation would lead to the most serious complications, and would strain, to a very dangerous extent, the relations, which are already somewhat precarious, between the two Governments. The resource of asking the Porte to intervene remains; but it has long been a maxim of both England and France that Turkey shall not be allowed to interfere in Egypt. It would be very difficult to get the Turks out if they once got in, and there would be a constant rivalry at Constantinople as to which Power should exercise the greater influence in determining what the Turkish troops in Egypt were to do. If there really was a military revolt in Egypt, the protecting Powers would probably find they had no choice, and must put it down. It is the perception that this must be the end of a revolt that for the present averts it. But the reluctance with which the Powers would interfere, and the still greater reluctance with which the KHEDIVÉ would see their interference, prevents any precautions against a revolt being taken and has prompted the acquiescence of all parties in concessions being made to the army, which, if followed by the still greater and more dangerous concessions which are demanded, or are sure to be demanded, must end in a revolt or in Egypt being subjected to a military despotism of a very vulgar and pernicious type.

#### LORD SHERBROOKE ON BANKRUPTCY LAW.

LORD SHERBROOKE has never been wanting in the courage which leads men to attack conventional ideas; and now that he is untrammelled by the thought either of office or constituents, this virtue has the freer course. The shield which he has last struck is Bankruptcy Law—bankruptcy law with no definite article prefixed to it and no limitation to this system or that, but bankruptcy law in the abstract. Lord SHERBROOKE cares nothing about refined distinctions between one bankruptcy law and another. They are all bad. Each in turn has had its special vices, but not one of them has developed any special virtue. The law which existed down to the beginning of the present reign was illogically hard upon men who were unable to pay their debts. It made an exception in favour of traders, and thus created the system which has since attained such tremendous proportions, but it rigidly shut out every one else from this solitary harbour of refuge. This distinction has long disappeared. To be made a bankrupt is now the right, under certain circumstances, of every subject of the QUEEN. Unfortunately the extension of this right, whatever it may have done for debtors, has done nothing at all for creditors. Two plans for distributing the bankrupt's estate have been tried in succession, and neither has answered the end which its framers had in view. In the first instance the property was handed over to officials. "The army of bankruptcy," says Lord SHERBROOKE, "was complete in all its parts, and 'the very model of a perfect and well-ordered department.'" Its single fault was one that "in no degree 'injured the symmetry of this splendid system.'" It was merely that "a great deal of money went into it, but very 'little came out.'" At length the creditors grew disgusted

with the poverty of the result, while the Government of the day were shocked at the dishonesty of the method employed to attain it. The bankrupt's estate was now handed over to the very persons who had most interest in making it yield the largest possible dividend. "It seemed as if the riddle had been at last read, and the 'working of a bankrupt estate was about to take its place 'among the exact sciences.'" The fault of this reasoning was that it treated the creditor as a man moved by only one set of considerations. It is true that he wants to save as much as he can from the wreck, but it is also true that he does not care to spend much time over a process which must at best be uncertain. More than this, he is a little ashamed at his own want of judgment in trusting a man who has failed. "He does not like to pose as an unsuccessful man, still 'less as a man who has been taken in,'" and the effect of his dislike is that he puts the whole business from him, and leaves the bankrupt's estate to be appropriated by any one who will relieve him of the trouble of getting it in and distributing it. The person most willing to bear this burden is usually the dishonest trader—acting of course by an agent. "The bankrupt flourishes, and the creditor 'loses his dividend, under the influence of a false psychology'."

The Government now seek to revive the system under which the bankrupt's estate was dealt with by a court. Lord SHERBROOKE makes some passing criticisms on the details of Mr. CHAMBERLAIN'S Bill, but he naturally feels but a languid contempt for a measure which, from his point of view, has no right to exist. He has, indeed, a short way of dealing with bankruptcy, but it is not one that can be called a bankruptcy law, except in so far as that name can be given to a statute which would simply repeal all previous statutes and set up nothing in their place. Lord SHERBROOKE'S doctrine is that in bankruptcies the creditors are just as much in fault as the debtors. The debt could never have been incurred unless the credit had been first given. "As every man is free to keep his money in 'his pocket if he pleases, in judging of such transactions moral considerations are quite out of place, 'and no intervention of penal law is demanded.'" When the creditor comes to Parliament with a demand to be avenged of his debtor, Lord SHERBROOKE would have him told that it is his own fault that the relations of debtor and creditor ever grew up between them. The creditor was not compelled to lend the debtor money, or to trust him with goods. He did so because he thought that the transaction would yield him a profit. Among the elements which entered into his calculations was, or ought to have been, the probability that the debtor would repay the money or give him the value of the goods. It is as much the creditor's business to estimate the value of this probability as it is the debtor's business to estimate the chance that the money or the goods which he has had advanced to him can be laid out at a profit. Lord SHERBROOKE declines to see any difference between the two cases, or to recognize any right in the creditor to recover from the trader the loss which his own folly has brought upon him. To make this process legal is "to punish the 'borrower because you were so imprudent as to trust 'him.'" Consequently, he would repeal the existing bankruptcy law and enact no new one. He would shorten the period within which debts can be recovered, and during the continuance of that period he would leave creditors to enforce payment on the principle of first come first served.

If a commercial code were being drawn up for the first time there would be something to be said for Lord SHERBROOKE'S suggestion. The surest way to avoid bad debts is to have no debts at all; and, in proportion as the means of recovering a debt become fewer, the temptations to allow one to be contracted will become less. Probably, if there had been no machinery provided for the distribution of a bankrupt's estate, the great body of creditors would not have been appreciably poorer. The money has been effectually disposed of, but very little of it has come into the right hands. But creditors who have been brought up in the hereditary conviction that it is the business of the law to protect them against their own want of judgment in determining whom to trust cannot be expected, in the absence of conclusive experience, to display this sublime common sense. When the failure of a particular method has been demonstrated they may be willing to abandon it; and not a single voice has been raised in defence of the system which the Government propose to abolish whenever

they can find a spare Session for the purpose. The unfitness of the creditors to distribute a bankrupt's estate has been demonstrated; on that point, therefore, they retain no misleading hopes. But, as regards the unfitness of the Government for the same work, no such conclusive proof has been supplied. Why should it be impossible for lawyers and officials to administer a bankrupt's estate with as much honesty as they bring to bear upon an infant's estate? No one accuses the Court of Chancery of eating up the properties which it has to control, and there is nothing in the nature of things to make the Court of Bankruptcy less scrupulous. The failure of a single experiment is not enough to convince creditors that the end to which that experiment was directed is unattainable. If it is thought expedient in the interests of the commercial community to entrust the ministers of justice with the division of the debtor's estate, there may be some means within our reach of preventing those ministers from appropriating the lion's share of the property to themselves. If such means exist, there is a reason for not abandoning the search for them, of which Lord SHERBROOKE takes no notice. Even if the system which would abolish bankruptcy by abolishing debt is abstractedly the best, we may still be anxious that the Government should not at once plead guilty to the charge that it cannot ensure that its ministers shall be decently honest. There is another reason which should make us hesitate before taking Lord SHERBROOKE'S advice. He argues as though the one object of a bankruptcy law were to prevent bad debts from being contracted, and in order to do this he is willing to go the length of discouraging debt altogether. Is it to the interest of a mercantile community that he should have his way in this respect? So long as debt is the word employed, the answer to this question may appear extremely simple. So many commonplaces have been uttered as to the benefits of ready-money payments that we can hardly hope to get beyond their influence. But what if the word credit be substituted for the word debt? Here we at once come within the range of a set of rival commonplaces. If debt has been the object of unqualified blame, credit has been the object of equally unqualified praise. Yet the two terms refer but to one transaction. Credit cannot exist without debt; and if credit is the very life of trade, debt has an equal title to be so described. Lord SHERBROOKE claims for his plan the merit of making trade safer and therefore more profitable. He may not perhaps have given sufficient weight to the fact that the dimensions of trade as well as its security must be taken into account when calculating gains.

#### THE TRANSVAAL.

THE Convention which has been concluded between the Commission and the representatives of the Transvaal Boers is apparently reasonable; but the most satisfactory circumstance in the transaction is that it has been found possible to make any kind of settlement. The Triumvirate, if it had not been disposed to act in good faith, might have inferred, from the manner in which the war had been terminated, that the English Government would be disposed to abandon any of its demands in preference to the risk of another rupture. It is true that there is still a considerable English force in the neighbourhood of the Transvaal; but, except for purely defensive purposes, it would have been almost impossible to resume hostilities. There was a much better reason for fighting at the moment when the armistice was suddenly announced than there could be at any later time; and the Boers might have taken it for granted that obstinacy could expose them to no worse danger than that of postponing the final evacuation of their territory. For those reasons the late reports of dissensions between the Commissioners and the Boer leaders seemed not incredible. It was said that several articles of the proposed Convention had been rejected by the Boers; and a personal objection raised by the Commissioners to the intervention and presence of one of the Dutch negotiators seemed likely to create serious difficulty. The terms which have been now arranged fall far short of the conditions which were contained in Lord KIMBERLEY'S instructions; but it was not desirable to insert stipulations which would almost certainly have produced future dissension. If the summary which has been published is accurate, the Convention is a

to the natives within and without the Transvaal must have been by common consent passed over in silence. Only last week Mr. GLADSTONE was understood to state in the House of Commons that the English Government would exercise a protectorate over the Transvaal natives through the agency of the Resident. It was at the time pointed out that such a division of power would be wholly inconsistent with independence; nor, indeed, had Lord KIMBERLEY definitely suggested to the Commissioners so anomalous a scheme. Mr. GLADSTONE appears to have correctly anticipated the mode in which the Convention would deal with the natives beyond the frontier. The whole controversy seems, in the opinion of both parties, to have been finally exhausted, for it was believed that the territory of the Transvaal would be handed over to the Republican Government at the beginning of the present month. It is nevertheless agreed that the Convention shall not be valid until it is ratified by the Crown and by a Volksraad to be summoned for the purpose. The English ratification will be easily obtained; but grave complications might arise if the popular Assembly were to repudiate the arrangements of the Triumvirate. The contingency is happily the less probable because the English troops are not to evacuate the territory before ratification. It is also agreed that, if the Volksraad rejects the treaty, the English sovereignty is to revive.

The provision that all State property, except munitions of war, taken over at the time of annexation shall be transferred to the new Government is probably not of practical importance. The State Treasury at that time contained only a few shillings; but there may be a few modest public buildings properly belonging to the Government which may at any time be established. It is less easy to understand the declaration that the English Government will pay for damage caused by the troops and the Republic for damage caused by the Boers. Private claims, confined to cases of injury, are to be subject to the final award of three persons named in the Convention; and indirect claims, such as those which might be founded on depreciation of the value of property, are rightly excluded. The Boer Government is to assume liability for the debt to the estimated amount of 400,000*l.* It is not stated whether, in case of default, the creditors, who will not be gratified by the substitution of a new security, are to be indemnified by the English Government. Mr. GLADSTONE'S statement as to the relations of the Suzerain with the natives in the Transvaal may perhaps have referred to a body called the Native Location Commission, of which the English Resident is to be a member. As the President or Vice-President of the Republic and another representative of the Boers will always form the majority, the influence of the Resident will probably be nugatory. Native location seems to mean that the natives may hold land, but it is expressly declared that they can only acquire a title through the Commission. If the Boers choose to exclude the natives from the possession of land, the protests of the English member of the Commission will have but little effect, yet it is barely possible that the natives may derive some advantage from the advocacy of their claims by one of the Commission. The functions of the Resident are strangely defined as corresponding to those of a Consul-General. As it is of the essence of consular authority that it should be exercised in a foreign dominion, it seems strange that the powers of an officer who will represent the Suzerain should be compared to those of a functionary whose duties are confined to protection of the interests of his countrymen under an alien Government. It may be admitted that the objection is mainly theoretical. After the restoration of independence, it became impossible that an English Resident should possess, in ordinary circumstances, the political authority which is associated with the title in the native States of India. One important right is, nevertheless, reserved to the representative of the Suzerain. In time of actual or apprehended war between the Suzerain and any foreign State or native Power, the Resident will be entitled to move troops through the territory of the Transvaal. He is also to have exclusive control over external relations; and it is clear from other articles of the Convention that native tribes beyond the frontier of the Transvaal are included among foreign communities. It is expressly provided that the independence of the Swazies shall be recognized; SECOCOENI and his followers are to be liberated; and the boundaries of their location are to be defined. It was unnecessary, or perhaps useless, to refer to

the Zulus; but they are not unlikely to give trouble. A pretender to the succession of CETEWAYO has raised a considerable force; and JOHN DUNN had asked the permission of the English authorities to resist his attempts.

The rights and property of Englishmen settled in the Transvaal are protected, as far as verbal stipulations form a security. Those of them who have actively exhibited loyalty to the English Government will, if the terms of the Convention are observed, be guaranteed in the enjoyment of civil rights, including possession of property. English-speaking citizens of the Republic will have no technical claim on the good offices of the Resident; but, if they are unjustly treated, they will probably be able by his means to communicate with their former Government on which they have a strong moral claim. English subjects living in the Transvaal will be under the protection of the Resident in his consular capacity. It is not improbable that disputes will hereafter arise as to the allegiance of Englishmen whom the Republican Government may claim as citizens. A double or doubtful nationality is, in imperfectly civilized countries, not unfrequently a convenience. English subjects will be exempt from compulsory military service, and they are to bear no burdens beyond those which are imposed on the citizens of the Republic. The Boer Government may perhaps hereafter refuse to recognize the privileges of permanent settlers who may desire to retain their English allegiance; but it is useless to anticipate complications which can scarcely be anticipated in framing a diplomatic or legislative instrument. By a valuable article of the convention it is provided that no differential duties shall be imposed on English produce. The Volksraad might, if it thought fit, enact a protective tariff; but under the treaty it must accord to England the privileges of the most favoured nation. It is not likely that, at least for the present, the Republican Government will impose duties, except for purposes of revenue. The governing part of the community consists of rich freehold farmers, who will not be exposed to the competition of foreign agricultural produce; and they have no disposition to engage in manufacturing industry. Any industrial enterprise which may be attempted will probably be undertaken by adventurers from the English colonies, who will exercise no political power in the Transvaal. The guarantees against nominal or real slavery are, as far as words go, complete; and it is possible that a definite prohibition of all practices of the kind may be more or less operative. No other part of the Convention will have so strong an interest for a large and respectable class in England; and it is probable that the professed opponents of slavery will be but imperfectly satisfied. The alleged kidnapping of children, and the domestic servitude which is disguised under the name of apprenticeship, have been long maintained in defiance of domestic laws and of the treaty under which the independence of the Transvaal was recognized. The crimes which have been committed may perhaps have been exaggerated, but the existence of compulsory servitude has been fully proved. The Boers may perhaps have at last learned that none of their institutions or customs is so likely to cause future infringements on their independence.

#### COMPETITIVE EXAMINATIONS.

**T**HE system of substituting competitive examination for patronage is too firmly established, is too popular with the public, and too welcome to those who without it would have to bear the distasteful burden of patronage to permit any thought of its being abandoned. With all its drawbacks, it may also be said to do more good than harm to the general education of the country. For the most part the conduct of the system is in the hands of the Civil Service Commission, and it is impossible to overrate the zeal and intelligence with which the Commission sets itself to do justice, to bring out what is best in the best candidates, and to bring good sense to check the abuses to which the system is always exposed. But the system is becoming a very far-reaching one, and raises questions which are outside the particular mode in which the examinations are themselves conducted. One of these questions was started on Wednesday by Mr. GOSSET in a discussion on the selection of naval cadets. The last Government did away with the system of entrance by competition which it found in existence when it entered office, and had recourse to pure nomination, subject to the

nominees being able to pass a test examination. The object of this change was not to get more patronage, but to prevent more children being subjected to the strain of excessive and premature work. The present Government has returned to the kind of competitive examination which prevailed when Mr. GLADSTONE was previously in office. The competition is not open, for only those candidates can try who have received a nomination permitting them to compete. For each vacancy three or more little boys are allowed to compete. The object of the limitation is a purely social one. It is intended to prevent any lad becoming a naval officer whose parents are not in a position to have some means of getting at the First Lord. But this opens so wide a field that patronage properly so called is in abeyance. An influential parent does not think it worth while to use his influence merely to get his child the right of going into an examination in which he is sure to be beaten. One of the worst effects of the patronage system is also avoided. The patron is subject to such extreme pressure from influential people that he not only fills up vacancies in accordance with their wishes, but is very apt to invent vacancies in order not to disappoint them. It is to the artificial creation of vacancies in this way in past times that the present block of promotion in the navy is largely owing. Under the present system there is no pressure of this special kind. All that the First Lord is asked to do is to put a candidate on the list for examination when a vacancy happens in the natural order of things, and he and the candidates wait until a vacancy occurs.

But, for the very reason that the competition is wide enough to do away with the evils of patronage, it is also wide enough to carry with it all the evils of competition among children. What those evils are needs no explanation. It is a bad thing for the body and mind of even a clever little boy to be stimulated by the eagerness to obtain a prize, and to be taxed by the concentration of much work into a little time. Mr. TREVELYAN said, in reply, that it was quite possible so to conduct the examination that a candidate shall not succeed by what is generally called cramming. It may or may not be a popular delusion that there is a secret art possessed only by crammers which enables them to foresee what questions will be asked, and to teach stupid boys exactly how to answer them. Perhaps after all the house of a crammer is only a school where there is little or no play, and where individual attention is given to each boy. But no secret art, as Mr. TREVELYAN remarked, can enable a little boy to translate, with only the aid of a dictionary, a piece of Latin which he has never seen before. The evil of the competition of children is not that they are induced to learn badly and superficially what they ought to learn well and thoroughly, but that they learn twice as much as they ought to learn in a given time. What is to be said in favour of the naval competition is that it is only a drop in the ocean of general competition which is going on, whatever may be the system of appointing naval cadets. All the innumerable scholarships by which little boys are admitted to a privileged position at a public school are stimulants to overwork which throw the tiny stimulant of naval competition into the shade. Every year the number of these scholarships increases, because a school that has no scholarships cannot attract the amount of clever little boys which, for its own well-being and repute, it desires to have. Nor is it at all difficult to invent scholarships; for it is easy, under some faint disguise, to tax the stupid boys for the sake of the clever ones. A slight and unnoticed contribution from the many provides for the few. Nor is it easy for parents who are indifferent to the money to allow their boys, if clever, to keep out of the stream of premature competition. The master of the school for little boys naturally concentrates his attention on the boys who are going in for scholarships, and who will do him credit, and the boy who is not to be sent in for a scholarship thus misses the best teaching that the school can give him. The whole system of scholarships at public schools for children, of scholarships at the Universities for lads, and of prize fellowships for young men, hangs together, and influences the tone and character of modern English education much more powerfully than the substitution of competition for patronage.

The only question that remains open is the age up to which children shall be protected against competition. If parents liked it, there seems to be no reason why the masters of private schools should not generally institute

entrance scholarships into their admirably conducted homes. The parents of the stupid boys would be delighted to find the money if some little disguise, such as that of giving two eggs at breakfast instead of one, was adopted; a child of nine would win the great SMITH Scholarship, while a lesser child who had, perhaps, been prevented doing full justice to himself by a sudden flood of tears would occupy the tamer but still honourable position of Proxime Accessit. With what fond triumph would a doting mother explain to a lady friend that her JOHNNIE was within a pocket-handkerchief of being the SMITH boy of his year. Fortunately, early education is still to a large extent under the control of parents who do not need pecuniary assistance, and who shrink from seeing a promising boy blighted by early success. The chiefs of the navy, at any rate, can fix the age at which the children for whom they are responsible shall compete. Mr. GORST wished that the competition for the navy should be entirely open; but then he also wished that the age at which the competition took place should be postponed, and that cadets should have finished their schooling and be ready to go to sea when they were appointed, instead of, as now, being kept after their appointment on board the *Britannia*, which is really nothing more than a particular kind of school. The difference between limited and open competition for the army and navy is almost nominal, for as long as the necessary preparation is as expensive as it is now, few poor men can get their sons in, and as long as officers find it difficult to live on their pay, no sane poor men would wish to get their sons in. As to postponing the date of entrance, Mr. TREVELYAN was really in accord with Mr. GORST. But he urged that the system of beginning the naval education of cadets when they were little boys had always been the English system. The first navy in the world has always caught its future officers when they were just out of the nursery. It is a standing belief in the profession that it is because the officers were thus taken that they have played their part so admirably, and Mr. TREVELYAN will not take on himself to say that the belief is unfounded. He thinks, however, that the schooling they receive might be condensed into a much smaller space of time than is given to it at present; that in a year and a half it might be finished, and that then the boys might be sent to sea, and allowed to forget their books. From this the transition to accepting them when they have done their schooling seems not a very difficult one.

#### THE FRENCH ELECTIONS.

THE sin of the French Government in taking the electors by surprise has already been forgotten. When an election is only three weeks distant there is no time for quarrelling over any question which is not important enough to affect the result. Even those who have said the strongest things against Ministers for anticipating the contest by a lunar month cannot affect to think the not so serious that the judgment of the country must be taken upon it. From that point of view it is so much surplusage, and as such it has been promptly put aside. The result has been to leave the field of controversy a little barren. There is no positive issue before the electors. The Extreme Left will look for one either in the abolition of the Senate or in the separation of Church and State; but there is no chance that either question will have an appreciable share in deciding the complexion of the next Chamber of Deputies. The Senate enjoys the great advantage of being elected by a very large constituency. It is true the process is an indirect one. But the election even of a delegate has its interest for those who take part in it; and every peasant in France would probably feel that he had lost a means of making his wants known if there were no longer a great Council of the communes in the return of which he might bear his part. It is a further difficulty in the way of a revision of the Constitution which should have for its object the abolition of the Second Chamber, that unless the process is to be effected by revolutionary methods the Senate must be consenting to its own death. It must vote for the convocation of the Congress in which the question is to be raised. There is no reason to suppose that the Senate is possessed by any such suicidal tendencies. Upon this proposal, at all events, the Conservative Senators might com-

mand a substantial majority. Nor is there anything to indicate that the country is disposed to adopt the violent courses which can alone make the consent of the Senate an unnecessary adjunct to a constitutional change. Whatever the electors may think of the institutions under which they are for the time living, they have apparently no wish to see them violently upset. As regards the separation of Church and State, the electors are equally well satisfied with things as they are. They have not been in the least offended by the measures already taken against the Church, for they have no love for monks, and no objection to see their neighbour's liberty restrained. But they seem equally without any desire to see the attack carried further, and they would probably dislike having the alternative presented to them of doing without religion altogether, and paying for its offices out of their own pockets. To all appearance, therefore, the character which the Extreme Left will try to give the elections will only be affixed to it in the large towns. The party will hold its own in the new Chamber, but it will not be appreciably strengthened.

No doubt this conclusion will have to be greatly modified if M. GAMBETTA should make either of these questions his own. After the utmost possible allowance has been made for the essential conservatism of the French peasantry, M. GAMBETTA's personal popularity remains a substantial fact, and his accession to any party must be an immense temporary gain to it. M. GAMBETTA's declaration in favour of the revision of the Constitution or the abolition of the Concordat would certainly secure the return of a much more Radical Chamber than the present Republic has yet seen. It is probable, however, that this result would be brought about rather by omissions to vote than by votes. The electors who felt that M. GAMBETTA had disappointed them would not support the candidates he recommended, and they would not have the time in which to make up their minds to support Opposition candidates. They would fall back, therefore, upon that constant weapon of French political discontent - abstention. The Chamber would be Radical, but it would be a Chamber representing only a minority of Frenchmen. There is no present reason, however, to suppose that M. GAMBETTA contemplates any such change of policy. Undoubtedly the rejection of the *Scrutin deliste* and the compromise with which the action of the Senate has been received by the country have placed him in a position of some difficulty. He has, in effect, offered himself as the leader of the Moderates; the Moderates have refused, not exactly to be led by him, but to be led by him on his own terms; and yet he cannot for ever remain poised, like MAHOMET'S coffin, between the Moderate and the Extreme Lefts. But there is reason to believe that M. GAMBETTA is too thoroughly convinced that the French people are at bottom anti-revolutionary, and that any politician who credits them with any different sentiment is certain, in the long run, to have his mistake brought home to him, to be tempted into further identifying himself with the Radical party. He will trim his sails to the last moment so as to catch their support; but, when the last moment comes, he will steer away on his separate course. Whether he will succeed in getting together a working majority without a more positive declaration of policy than he seems at all anxious to put out remains to be seen; but, so far as his plans can be divined from the *République Française*, he is hopeful on this head. The business of the electors, says this journal, is to create on the 21st of August a Governmental majority. They may do this by going backwards or by going forwards. They may strengthen either that section of the Moderate Left which approaches most nearly to the Left Centre or that section of the Advanced Left which approaches most nearly to the Moderate Left. Translated into practical language this is an exhortation to give the preference to candidates supported by the group which calls itself the Republican Union. If the electors follow this advice M. GAMBETTA will no doubt consent to take office whenever it is offered him, and as soon as this fact is understood it will probably not be long before M. FERRY is invited to efface himself as the pleasanter alternative to being effaced. If, on the other hand, the electors return a Chamber which is scarcely distinguishable from the actual Chamber, it is not easy to foretell the result. On the principle that like causes produce like effects France would be delivered over for another four years to the same succession of weak Ministries which she has seen for the past two years and a half. It seems scarcely possible, however, that M. GAMBETTA would run the risk of thus

overstaying his market, and he might be forced to formulate a policy and trust to its acceptance by the country to convince M. GRÉVY and the Senate of the need of a dissolution.

It is quite possible that the almost unnoticed existence of Prince NAPOLEON has had an important share in determining M. GAMBETTA to take office whenever the Republican majority can be brought into line. For a time it seemed doubtful whether he looked forward to being Prime Minister or to being President. In the latter case he would certainly have laboured for a revision of the clauses in the Constitution which make the President irresponsible, and vest his election in the two Chambers sitting as a National Assembly. M. GAMBETTA would hardly care for the form without the reality of power, and a President cannot have the reality of power unless his claim to call himself the representative of the nation is as good as that of the Legislature. A position similar to that enjoyed by a President of the United States is one that would have many attractions for an ambitious Frenchman, but if it is only to be gained by direct popular election the chances of successful rivalry must be taken into account. It can scarcely be doubted that if France had now to elect a President by universal suffrage, M. GAMBETTA would be returned either unopposed or by an enormous majority. But if M. GAMBETTA were to fail in the exercise of power, Prince NAPOLEON might be a formidable competitor at the next Presidential election. When a nation has to decide between one man and another, there is no room for the cross intrigues which give an element of uncertainty to the best arranged election of representatives. This at all events is the one end which Prince NAPOLEON thinks worth striving for. In his letter to the committee formed for keeping before the electors the paramount importance of restoring to the people its inalienable right of appointing the President of the Republic and the Senate, he declares that he accepts the duty imposed on the heir of the NAPOLEONS by so many popular votes—the duty of demanding that the French people shall elect their ruler. In the interests of the Republic M. GAMBETTA is probably wise in declining to make this demand his own; and the only alternative to doing so is to call upon the electors to make a strong Ministry possible.

#### THE LIVERPOOL FENIANS.

THE conviction of M'GRATH and M'KEVITT for attempting to blow up the Liverpool Town Hall may make it somewhat more difficult to find agents for the execution of the Fenian designs against England. The members of the Society which has passed sentence of death on Mr. GLADSTONE, and cherishes a peculiar hatred to English public buildings, profess to be altogether indifferent to what may befall them in their own persons. It is allowable, however, to doubt whether this impassive attitude will, in all cases, be maintained in presence of a possible sentence of penal servitude. Among the Russian Nihilists the case is different. They seem really to forego every chance of escape, and to be content to perish themselves, provided that they can ensure that their enemies shall perish with them. But the Russian Nihilists have had a very different measure of provocation dealt out to them. They live in a society which is rich in permitted abuses, where criticism even of the mildest kind has long been prohibited, and where the punishments awarded are proportioned rather to the temper of the Government at the moment than to any consideration of the nature of the crime. Here are all the elements which engender reckless violence, but there is not one of them which is present among the American Fenians. They cannot themselves be sufferers under the Irish land laws, for both the principals and the agents are ordinarily residents in the United States. They have not as yet been prosecuted for any of the incitements to murder which daily appear in their newspapers, and the two men convicted at Liverpool on Tuesday are the first who have tasted the useful severity of the English criminal law. There is some reason to hope therefore that in disabusing M'GRATH and M'KEVITT of the notion that a bomb can be placed against the wall of a public building without any risk to the amiable enthusiast who makes himself the instrument of his country's vengeance, Mr. Justice LORE and the Liverpool jury have done a real public service. Unfortunately, the trial led to no disclosure of the system upon which

these miscreants proceed. The case for the prosecution dealt chiefly with the pursuit of the men who had been seen by a constable in the act of placing the bag which contained the bomb against the wall of the Town Hall. For the purposes of conviction this was a point of the utmost moment; but its importance was at an end as soon as the conviction had been obtained. All that could be discovered as to the antecedents of the prisoners was that they had been living in Liverpool for two months, that they had made the bomb in their lodgings, and that one of them was the agent of a paper of O'DONOVAN ROSSA's, while the other had occasionally spoken of his connexion with the dynamite propaganda in America. There is nothing in all this to suggest any new precautions against similar outrages. Except in so far as the news of the sentences passed on M'GRATH and M'KEVITT may serve to warn off imitators, we are no more secure now than we were before they were tried.

The prospect is one that becomes more unpleasant the more steadily it is looked at. Probably, indeed, the intellect of O'DONOVAN ROSSA and his friends is not quite equal to their wickedness. And this consideration suggests a large percentage of failure to a small percentage of success. But even this small percentage of success may do us irreparable injury. The destruction of the Liverpool Town Hall or the Houses of Parliament would be only a question of money. But there is no certainty that the designs of these American Irish would be restrained by æsthetic and historic considerations. They would pull down Westminster Abbey or burn the National Gallery, and do so all the more readily if they had wit enough to realize that the injury they were inflicting was beyond reparation. They have not hitherto shown much skill in bringing their machines into position, but in this respect they may be learning wisdom from experience. At all events, it is not safe to assume that their blunders will be repeated as often as their crimes. It appears, too, that they are making great improvements in the construction of the machines which they employ; and it is obvious that increased perfection in this respect adds not only to the destructive force of the instrument, but to the security of the man who applies it. It is very much easier and safer to fix a bomb which will explode by clockwork six hours after it is wound up than to fix one which at once begins to smoke in a way that betrays what it is designed to do. No ordinary amount of watchfulness can ensure a public building against this kind of attack. There must be an absolute cordon drawn round it within which no unknown person is allowed to move about except where he can be watched by the police on duty. Even if buildings of extraordinary national value can be protected in this way, there is no reason to think that the ingenuity of their assailants would be exhausted. The destruction of human beings is as much an act of warfare as the destruction of so much brick and mortar; and a clockwork bomb, placed over-night in a market, might be set so as to explode with tremendous effect at the busiest moment of the morning. The loss of the *Dolera* shows how effectively these new machines may be employed if a member of the Society happens to be for a short time a seaman in the QUEEN'S service. He has only to desert or to get leave as soon as he has set his clockwork for a certain hour, and the catastrophe follows almost inevitably, while he himself apparently incurs no danger. It does not much matter whether any alternative explanation can be suggested in this particular case. The facts are quite consistent with the hypothesis of Fenianism; and, though O'DONOVAN ROSSA may be lying when he claims the deed as his own, there is nothing to show that he is not speaking the truth. When we read such ravings as those extracted by the *Standard* from O'DONOVAN ROSSA's journal, it may at first seem idle to treat them seriously. The description of the trial and sentence of Mr. GLADSTONE, with its interlarded capitals, resembles nothing so much as the proceedings of that famous society of which SIM TAPPERTIT was president. The slow rising of "one of the Directors—he holds an important position in a wholesale importing house in New York," the record in blood-red ink in the secret book, the calling up of the "GLADSTONE death motion" at a later meeting, the stern and determined looks, the deeply breathed "Ay," the low burning gas, are precisely the incidents which DICKENS would have borrowed as more humorously appropriate than anything he could possibly have invented to the dark designs of his spindle-shanked apprentice. Unfortunately there is another side to the business. The actors in

this scene may intellectually and morally be hardly higher than unusually mischievous monkeys; but science has armed them with extraordinary powers. One of the ghastliest murders in fiction was the work of a manlike ape who had accidentally got possession of a razor, and no limit can be set to the disasters that may conceivably be wrought by ape-like men who have got possession of dynamite.

What is to be done in such circumstances as these? It is proper, no doubt, to urge upon the United States Government the importance of making diligent search for the makers and exporters of these machines, and it is so completely their duty and their interest to comply with our representations that no doubt can be entertained of the result. But it is equally proper and more useful to bear in mind how very little any Government can do to prevent a crime which consists in the manufacture of machines, one element in which is in itself quite innocent, while the other admits of being conveyed in a hundred different ways. If dynamite could only be hidden in cement barrels, it would be easy enough to search every barrel before it was put on board. In that case, however, it would be easier still to examine every barrel before it was landed, and there would be no need to ask the United States Government to do the work of our own Customs-house officials. But dynamite need not be concealed at all. It may be imported in a thousand seemingly harmless shapes, and have its equally harmless little clockwork movement affixed to it after its arrival. It is eminently an affair in which we must help ourselves. If the enemy cannot be defeated in England, there is little chance of his being defeated on the other side of the Atlantic. How he is to be defeated here is a more difficult question, especially as the method which first suggests itself is one to which Englishmen have a great and natural distaste. It is the men who import these machines, not the machines themselves, that we must try to get at, because if these men could once be filled with a sense of constant insecurity, they would probably be less willing to offer their services to the Society which sits at home at ease in New York while they are risking their liberty, if not their lives, in England. If the Habeas Corpus Act were suspended in the case of all persons suspected of being mixed up with these dynamite enterprises, the Government would at least be armed with a power which would be useful, because it would be mysterious and uncertain.

#### COSMIC EMOTION.

AMONG other reasons for not getting rid of the Christian religion we do not remember that Swift mentions the difficulty of providing a cheap substitute. The innocent Freethinkers and scribbles of his time were likely to be more influenced by the fear of losing a standing butt of men of wit. But now the various sets of advanced people who agree on only one topic—namely, that Christianity is played out—are in reality rather an affecting quantity. They are by no means men of wit—indeed, they all resemble each other in a singular lack of the sense of humour. They are extremely respectable, their intentions are excellent, and they are persuaded that a cheap substitute for Christianity is what advertisements call “a felt want.” It is not the simplest thing in the world to start a new religion—a thing that has never yet been done without considerable discomfort and self-sacrifice on the part of the founder. Yet cheap substitutes are offered on every side. While these rarely seem satisfactory to the more Philistine, with his blind and bigoted attachment to exploded Dogmas, still less does each inexpensive substitute command the respect of the friends of some other mixture. Possibly the inventors of Hedozone and of Zoedone entertain no lofty opinion of the rival liquors, and the patentee of the last new thing in shoddy butter has probably a settled conviction that oleomargarine can never really satisfy human yearnings at breakfast.

An eloquent paper of Mr. Frederic Harrison's in the August number of the *Nineteenth Century* aptly illustrates these professional rivalries. Mr. Harrison is an agent for the Religion of Humanity, and a friendly periodical admits that he despises cosmic emotion and pantheism even more than he contemns the creed attributed to St. Athanasius. We confess that we know but little of cosmic emotion considered as a substitute for Christianity. It is very difficult for a plain man to keep up with the march of religious invention in this prolific age. The new religions succeed and do not resemble each other. A few years ago we had Miss Cobbe, determined to be creative and constructive, determined, as Emerson says, to brace us with affirmations, and not to leave us among barren negations. Miss Cobbe's religion, and that of other creative and constructive geniuses, was compared by Mr. Arnold to the British College of Health, “which does credit, perhaps, to the resources of Dr. Morrison and his disciples,

but falls a good deal short of one's idea of what a British College of Health ought to be.” In fact, the new churches were merely very tiny dissenting chapels, and certainly fell short of a high and perfect ideal.

To remedy this fault, it is probable that various new religions have been started, and have waned away like flowers that blush unseen. We confess that, if it had not been for Mr. Harrison's eloquent and destructive criticism, we should not have been aware of the existence of cosmic emotions—by the way, a recent poet spells cosmic with a K, which gives the thing more than ever the air of something patent you might buy at a speculative barber's. From what Mr. Harrison says, it is plain that cosmic emotion is one of the things that a certain set of people think it necessary to “get.” In serious coloured circles, in America, the one thing necessary is to “get religion.” In Boston, U.S., some people “get” dynamite; others addict themselves to “getting culture.” Cosmic emotion, at least in this country, is most readily got by going out on a fine night and viewing the starry firmament. “Then,” says Mr. Harrison, “the exhausted spirit feels almost on the threshold of immensity, and half believes that each instant the heavens are about to break open to their highest, and those human eyes are about to know the reality of the Unseen. We have all known that moment,” adds Mr. Harrison, perhaps too sweepingly, and he goes on to observe that “we have lain down with a delicious void in our hearts.” That void, if we are not mistaken, is cosmic emotion. But, as Mr. Harrison observes with force and truth, the sensation of a delicious void, and all the other sensations which precede and accompany it, are not religious. “Is it enough to guide lives, to curb passions, to give light to despair, unconquerable force to societies, nations, races?” Plainly a void, however delicious, cannot do that, and if only religions can do that, cosmic emotion is not a sufficient basis for religion. Here it may be observed that, if Mr. Max Müller's theory of the origin of tree and river and mountain worship is correct, these forms of religion had their source in cosmic emotion. Early man felt a sense of awe and mystery in the view of trees which were ever so much more high than he, and lived ten times as long. Rivers and hills impressed him in much the same way, so he took to worshipping these phenomena. If this theory were correct (and it must be remembered that Mr. Spencer's theory is quite different), cosmic emotionalists would be returning to the religious condition of the ancestors of the race.

Mr. Harrison brings various arguments against the disciples of the religion of cosmic emotion. That emotion is apt, it appears, to result in a kind of sentimental optimism, a vague general belief that “the All” is all right, “a very big thing,” as Mr. Harrison reverently says, and a conviction that things in general will “come round and be all square,” as some one says in *Black House*. Mr. Harrison points out that there is nothing in the aspect of the Cosmos which gives grounds for this opinion. “Waste, ruin, conflict, rot are about us everywhere.” They are, indeed. Beauty and harmony do not have it all their own way “in those regions of space where they tell us suns explode and disappear, annihilating whole solar systems at once.” Thus “the All,” though distinctly “a big thing,” as Mr. Harrison tells us, is certainly rather mixed. Rot is about us everywhere. And, even where the world is beautiful, it owes that beauty, Mr. Harrison says, chiefly to man. Poets have taught us to enjoy it. Practical agriculturists, landscape gardeners, and others have trimmed and adorned it. “The flowers, the forests, the plantations, the meadows, the uplands waving with corn and poppies, are the work of man.” Is all this quite scientifically correct? Some evolutionists aver that the credit of creating flowers is due to birds or butterflies; we are not certain which, but we incline to butterflies. The forests, again, are they the creation of man? Mr. Gladstone can fell a tree, but can he make one? Who planted out Australia? Certainly not the unconstructive race whom the first European voyagers found there. The Alps, the snow, the rainbow, too, are beautiful; but we do not understand the sense in which they can be called the works of man. Mr. Harrison has too dogmatically got rid of the old theory that “God made the country and man made the town.” But Mr. Harrison is craftily leading up to the doctrine which is to supersede cosmic emotion. “The earth was a grisly wilderness till man appeared,” and that is a gentle introduction to the recommendation of the Religion of Humanity.

The arguments against cosmic emotion have been stated. Nothing comes of it, it does not lead to anything, it cannot direct or inspire society, and it is based on the misconception that there is a good deal of beauty not created by man, and that beneficent law is present, and ultimately victorious in the universe. Mr. Harrison asks what good can come of “any of these sublimities” at moments when, in old days, religion was invoked? What do the fatherless and the widow care for sunsets? Will the debauchee be converted by the sweet influences of the Pleiades? When the enterprising burglar is not burgling, does he really care to hear the pleasant rivers run? When “the demon of anarchy is gnashing its fangs at the demon of despotic cruelty,” is he moved to sweet solemn thoughts by the contemplation of Orion? No more than the chambermaid, according to Mark Twain, is moved by the idea of a future. As cosmic emotion cannot do what it is the main business (according to Mr. Harrison) of religion to do, as it cannot improve daily life, where are we to look for a substitute? Why, to the Religion of Humanity.

Thus we find Mr. Harrison taking his stand on the old controversial ground of curates in conflict with sceptics, of Mr. Mallock

in controversy with Positivists. People will not be good unless they believe what I believe, say Mr. Harrison and the curates. What Mr. Harrison believes in is life for others. "Whilst one mother struggling to save one child were left on this mere flock of dust in the countless procession of the suns, the devotion of that poor creature to her offspring, the love and trust of her child for her protecting parent, have a deeper religious meaning than all the music of the spheres, or the mystery of the cosmic forces. There, where these two are cowering together in trust and love, there are still *life for others*, labour for others, endurance for the sake of something not our own, a sense of reverence and gratitude for protection, conquering pain and leaping over death. And if we are to seek the sources of religion, the ideal of religion, in the rushing firmament of suns, or in the withering waifs and strays of humanity, who are yielding up their last breath in mutual trust and love, we shall have to look for it in them [i.e. the withering waifs], for we can find it only in humanity, and in the world around us as the sphere and instrument of humanity."

Mr. Thackeray found it necessary to warn his childish readers, after some remarks of King Valoroso, that "blank verse, I need not say, is not argument." Nor is the eloquence of Mr. Harrison. According to that writer, the world was a grisly wilderness before the arrival of humanity. But the cave-bear, we believe, preceded the advent of humanity. And it is absolutely certain that a she-bear, if deprived of her cubs, displays all the emotions in which Mr. Harrison finds the sources, and apparently the sanctions, of religion. If all men and women were dead, and only a maternal Polar bear, her cub, and a wolf were left on this mere flock of dust in the countless procession of the suns, and if that wolf attacked that bear-cub, the devotion of the she-bear to her offspring, and the confidence of the offspring in the she-bear, would be as deeply religious as ever. Humanity has nothing to do with the business. Religion, on this showing, is as old as the maternal instinct in pterodactyls and rhyphlogons. Thus humanity is not so peculiarly worshipful as Mr. Harrison would have us suppose. And, even if we accepted his religion of humanity, where is its practical force? The demon of anarchy who gnashes his fangs, as Mr. Harrison says, at the demon of despotic cruelty, is very likely a believer in the religion of humanity. But he goes on gnashing his fangs all the same. Or, if you choose to try the debauches with the religion of humanity, will he be more moved than he was by the procession of the equinoxes? Not he. He will point out to Mr. Harrison that humanity is no more universally beautiful than the Cosmos at large, and, even when he finds beauty, he does not regard it in a religious and prayerful spirit. Humanity we have always with us, its influences are ceaseless throughout life, and it by no means interferes with the operations either of the demon of anarchy or of the glutton and the cheat. In fact, good people will be good, and bad people bad, and both will find irreligious excuses or religious sanctions for their conduct, while the world stands. The general idea of humanity influences, and will influence, perhaps even a smaller number of people than are morally affected by the conclusions they choose to draw from "cosmic emotion."

#### NORTHAMPTON'S PRIDE.

THE last reported words of Mr. Bradlaugh on the 4th of August, a day ever memorable in the annals of freedom, are reported to have been "at any rate Northampton should feel proud." It is not often that we find ourselves in agreement with Mr. Bradlaugh, but on this occasion we are disposed to think that he was quite right. Northampton by electing and re-electing him has shown distinctly the kind of man it wants, and the kind of performances it wants from him. The town of shoemakers must be very hard to please if it is dissatisfied with the performances of Wednesday last. "It is hard," the Northamptonites may fairly argue, "to secure a really distinguished representative; one who is obviously and eminently first in his own line. We have done this. We have got a member who is ready to present to the House of Commons identically the same appearance as that which an excited person of the opposite sex presents occasionally in the streets or at the door of a public-house. Like her, he screams and scratches, hustles and collars. As in her case, it takes a vast numerical superiority of force to overcome his gallant defence. Like her too, at least according to the authority of the revered Chancellor of the Duchy of Lancaster, he ends in a dead faint. Now it is not every member who is prepared to reduce himself to the level of a police-court virago, therefore let us be proud of having such a unique representative." Indeed, the only subject which might dash the pride of Northampton is the reflection that she might have had two representatives simultaneously hustling the police and collaring the messengers. A moment's thought, however, must show the men of Northampton that this is unjust to Mr. Labouchere. "He works his work, I mine," the sitting member for Northampton may say. Thackeray long ago pointed out that in the honourable profession of rooking there were diversities of operations. Only one man can actually win the money, others can look over the victim's hand, advise him to double the stakes, drive him down to the City to sell out, &c. So, too, even Mr. Bradlaugh requires a partner inside the House to argue the case, move resolutions, draw tears from the iron cheek of the senior member for Birmingham, and so forth. *Non omnia*, &c. The merit of Mr. Labouchere

may be less shining than that of Mr. Bradlaugh, the parts he plays may have less action and dramatic force about them. But Northampton is justified of both her members, and ought to be proud of both.

London and England and the world have been copiously invited by Radical newspapers to weep for Adonais, to bewail the solution of continuity which manifested itself in his coat, and to drop the frequent tear over his broken stylographic pen. It is to be feared—and a perusal of Mr. Gladstone's oracle, the provincial press, makes the fear still stronger—that the world has declined to weep. If it does not laugh very much, it is simply because the comedy is of an extremely low order. If one of the aforesaid viragoes began to brawl upon any gentleman's door-steps in ordinary life, he would send for the police, tell his servants to help them, and get her conveyed to her natural home—the police station—but he would not be much amused at the proceeding. That is what the Speaker did, except that, with politic or impolitic mercy, Mr. Bradlaugh was "left cooling" in a chair instead of being domiciled in Newgate. The House of Commons is, of course, to be sincerely commiserated in the matter. In public as in private life, it is always possible for a man or a woman who has little to lose to give a great deal of pains and annoyance to those who have much. It is certainly unpleasant for the House to know that Mr. Bradlaugh is prowling about with a tail of ragamuffins, and that at any moment there may be an unseemly squabble at its doors. The unpleasantness, however, is unavoidable so long as constituencies are sufficiently lacking in self-respect to send to the House candidates who have no business there. Mr. Bradlaugh's conduct is, of course, perfectly intelligible. He had lost his cause in the House of Commons, he had lost it in the courts of justice, he had lost it even before the very friendly tribunal of those Radical organs of opinion which were disgusted at his tergiversation in the matter of the oath. A bold stroke was necessary, and it has been very fairly successful. The remarkable intelligence of the before-mentioned organs has come to the conclusion that Mr. Bradlaugh's willingness to brawl and hustle at the door of the House is somehow a disgrace to the House itself. Mr. Bright—since Mr. Bradlaugh is not an Irish landlord—has felt his bowels of compassion moved over him; the seeds of a new agitation are sown, and the hand of the Government is once more forced. All this, of course, is exactly what Mr. Bradlaugh wishes. To persons of his stamp notoriety is in a good many senses the breath of life. Mr. Bradlaugh was losing this notoriety; he has regained it at the cost of a torn coat and a broken pen—no very high price to pay. The squabble of Wednesday has, it need hardly be said, absolutely nothing to do with the constitutional question at issue. The House of Commons, the courts of justice, and last, not least, Mr. Bradlaugh himself, have decided that at present no machinery exists whereby he can take his seat for voting purposes at the present time. If he can overthrow this decision by half throttling an usher and getting himself into an unseemly pickle, a new, short, and most efficient way to the House has certainly been pointed out.

To do the Government justice, their former conduct in the matter has rendered it almost impossible for them to do anything now without plunging themselves deeper in the mire. But they cannot be congratulated on their behaviour either *à propos* of Mr. Bradlaugh's Trafalgar Square meeting or *à propos* of the brawl in the Lobby. There was first the question of the Trafalgar Square meeting. That the Government were not within their discretion in refusing to prohibit that meeting we by no means intend to maintain. In the abstract there is no way of keeping the riffraff of a great city quiet more effectual than letting them "meet" just as they please. A few thousand roughs and *badauds* (the estimates of fifteen or twenty thousand which were made were, let us say in passing, a ludicrous exaggeration) might have jostled and howled, applauded Mr. Bradlaugh's windy platitudes, and cheered the mountebank garb of some of his influential supporters to their hearts' content anywhere else. But assemblages in the neighbourhood of the House of Commons for the purpose of intimidating the House of Commons are very properly forbidden by statute, and it was sheer absurdity on the part of the Home Secretary to pretend that this statute was not contravened on the occasion. "There is no ground," said Sir William Harcourt, "on which I can have authority to interfere with the meeting." There was every ground, as it happened, and as the event proved, the "distinct statements" on which Sir William relied, "that no one was to go to the House of Commons," turned out as valuable and effectual as might have been expected. No sooner was the meeting over than, what a friendly critic calls an "ugly rush," was made to the House, a rush which after all had to be driven back by force. On Wednesday the arrangements were effective enough, and it is probable that, if the "thousands of devoted men," as the same authority calls them, with their "passion-lit faces," and all the rest of it, had made their effort, they would have found the effectiveness to their cost. It is worth noticing, by the by, that Mr. Bradlaugh distinctly threatened violence. Whether he said that a force "within a million" was at hand to support him or a force "within a minute" does not in the least matter—the threat remains. There is, fortunately, not the least reason for believing that any attempt to carry out his threat would have any other result than the breaking of some heads which very well deserve to be broken, and the letting out of a little blood which is certainly not over pure. But if the Government (that is to say, the police) took efficient steps for the preservation of order outside, how was

it inside? They allowed one of their own number to offer a distinct encouragement to agitation for the purpose of overawing the House, to give a ludicrously inaccurate and coloured account of what had happened, and without disguise to take the part of perhaps the most flagrant offender against the privileges and dignity of Parliament who has ever been known in its annals of half a dozen centuries. It is certainly not too much to say that whatever good was done by Mr. Gladstone's not too enthusiastic maintenance of the Speaker's dignity, was undone by Mr. Bright's mischievous and reckless speech. As far as Mr. Bright was concerned, he was appropriately punished; to have laid oneself open to a well-deserved, unanswerable rebuke from Mr. O'Donnell is not an experience that any one can enjoy.

If it were not for the indecency of a bear-fight of this kind, and the mischievous use made of it by unscrupulous partisans, the whole thing would, of course, be absurd enough. Since the celebrated conflict on the Shannon shore, no tribune of the people has cut quite so sorry a figure as Mr. Bradlaugh. The comparison, too, does the Irish victim a good deal of injustice. Those who interrupted the muffins were, in his case, undoubtedly the aggressors, and they subjected the noble Smith O'Brien to unprovoked outrage. Nobody snote Mr. Bradlaugh on the nose on Wednesday, and his dilapidations were simply due to his own attempt to force the passage, and his struggles against the officials in the execution of their duty. A sympathizing reporter says that the victim of tyranny "instinctively selected the biggest man" to collar and throttle. It does not require much heroism to select the biggest man when you know that the biggest man has orders not to do you any bodily harm. The pathetic faint which so impressed Mr. Bright will scarcely produce an equal impression on those who have seen a naughty child in the "tautums." A person of excitable temperament, who finds himself completely powerless, naturally gets into a very great rage, and this rage has often a considerable effect on him; but as only very foolish nurses suppose that the naughty child will do itself a mischief by screaming or stiffening, so it is only very foolish Chancellors of the Duchy who suppose that Mr. Bradlaugh's faint was deadly, or anything like it. The police, as we have hinted, have considerable experience of this form of hysteria, and they seem to have treated it in the appropriate fashion. Whether water, brandy and water, or sherry and lemonade was the restorative employed is a very interesting point which the future historian will have to settle. But at last the farce came to an end. Mr. Bradlaugh held what even his admirers call a not very dignified parley with Inspector Denning, in which, however, he seems to have acted with a good deal more dignity than when he tried to throttle the messenger, he sat on his chair, drank his water, heard that some two hundred members of the House of Commons had voted against him and seven for him, got into a cab, and drove to ask for a summons against the police. So with the inevitable speeches at the Hall of Science, interviews, &c., ended a day which was certainly disgraceful enough to himself and to the persons who supported him in and out of Parliament, but which cannot be said to have been disgraceful to anybody else. Some day, perhaps, it may be the law of England that, if a brawling stranger thumps and swears long enough at the gate of a house, kicks the butler, throttles the footman, and threatens the housemaid, he shall be admitted and have right of lodging forthwith. At present, however, there is no law to that effect, and Mr. Bradlaugh is, in virtue of a resolution of the House, which is supreme in its own cause, nothing more than a brawling stranger until he makes due submission and resumes such privileges as his incapacity to take the oath leaves him.

#### DR. PLUMPTRE ON MODERN SCEPTICISM.

THERE are many points of view, hopeful or desponding, controversial or conciliatory, tolerant or fanatical, from which a Christian believer may regard the altered relations of modern thought to the great struggle between faith and unbelief which, in some shape or other, presents itself in every age, and is perhaps specially characteristic of our own. Between those who simply exult in the "increasing purpose" that runs through the ages—and which seems just now to be running very fast—and the mere *laudator temporis acti*, who contents himself with unpractical lamentations over the *pitias* and *prævia fides* of a bygone age, there are many intermediate gradations; and some who are willing to rejoice that "knowledge comes" may still be tempted to regret that, in many cases at least, "wisdom lingers." In a paper contributed to the July number of the *Contemporary Review* Dr. Plumtre, with characteristic absence of any *mauvaise honte*, has essayed, within the space of nine pages, to review the entire present condition of the "Fields of Conflict between Faith and Unbelief." He observes indeed that, in the limits he has assigned to himself, his treatment must be "somewhat superficial." But dogmatic utterances are wont to be succinct; and Dr. Plumtre's theological lucubrations—whether in the form of letters, sermons, or review articles—have usually something of the grand air of an ecumenical and *ex cathedra* pronouncement. It will not, therefore, surprise any one familiar with his writings that he should include in this brief allocution, originally delivered at Sion College—which he "ventures to compare" to Bacon's *Advancement of Learning*—a bird's-eye view of the "scientific, critical and historical, and ethical" aspects of the existing controversy between

faith and unbelief, together with an elaborate preamble on the "general character" of the conflict. He considers—so far rightly—that the method of conducting it has become more civilized and courteous, which, however, is mainly due to the more refined temper of the day; and he is obliged carefully to limit this admission, in a footnote, to the leaders of the Secularist army, inasmuch as "the papers largely circulated among our working classes show that the rank and file contains at least many who are so savage and brutal in their utterances that they represent what may be best described as 'Condorcet filtered through the dregs of Paine.'" With this important limitation, however, the following remarks may be allowed to be substantially correct:—

The combatants do not enter battle as in the war-paint and with the war-cries of barbaric tribes, but for the most part in the temper of those ancient knights who before and after they fought with lance or sword exchanged their salutations of mutual kindness and respect. We seldom now speak of those who are unable to accept the faith of Christendom as an infidel party. We use the term Theist rather than Deist, because the latter carries with it an offensive connotation from which the former is free. Though many men of science hold premises which logically lead to Atheism, no one, I suppose, except the junior member for Northampton, is called "an Atheist." We do not assume that all unbelief must spring from immorality of life, or look on doubters or assailants as consciously enemies of truth and goodness. We do not back up our arguments with anathemas. There has been, I need scarcely add, a corresponding change on the other side also. The religion of Christ is no longer treated, as in the coarser unbelief of Voltaire and Paine, as the work of priestcraft, and its preachers as impostors. For the most part, though there are some exceptions, we find the character of Christ regarded with reverential admiration, and the Christian Church treated as an important factor in the history of European culture.

As examples of this modified tone among the assailants or critics of Revelation are cited the names of Renan, J. S. Mill, Greg, Strauss, Matthew Arnold, and Tyndall. And, in spite of the obvious retort of those who say *Timeo Danaos et dona ferentes*, the writer holds this change to be matter of rejoicing and thankfulness. Nobody of course will desire to recall the good old days when *putidissimus iste* was the mildest formula of reproach a Christian apologist could find for even his least hopelessly heterodox opponent, while a sceptic like Tom Paine was eager to inform the public how at the mature age of eight, after first hearing of the Christian doctrine of the Atonement, he "immediately went out into the verandah and revolted at it." But as regards the effect on the masses of this more civilized tone of sceptical literature, it is necessary to remember that the change does not penetrate far below the surface; and if, as Dr. Plumtre opines, no one but the junior member for Northampton is now called an Atheist, there are a good many more who do not shrink from the kind of language for which Mr. Bradlaugh has made himself unpleasantly notorious, and which we do not care to quote here. There is a further and very important deduction to be made from the religious value of the "fair words" proffered by sceptical assailants, which will be most conveniently noticed when we come to deal with the ethical aspects of the question.

Dr. Plumtre naturally begins with the scientific assault on the principle of "a supernatural Revelation attested by miracles." And here he is probably right in asserting that the "possibility of a miracle"—assuming of course the postulate of theism—is no longer generally denied; certainly Mill expressly admitted it. Nor is there any want of plausibility in the argument he repeats—and which has been forcibly dwelt upon by Cardinal Newman, though he does not say so—that, if there be a Deity, it is more likely that He would reveal Himself to His creatures than leave them uncared for and unguided. But there is no inconsistency between this line of argument and that pursued in the very able "Bampton Lectures" of the late Professor Mozley—noticed at the time in our columns—as to the real meaning of the uniformity of nature, which Dr. Plumtre goes out of his way to disparage. That mere conventional interpretations of the language of Scripture are not likely to be pressed in this day by Apologists, against the legitimate claims of science, may be inferred from the appearance in a recent number of the *Dublin Review* of a paper from the pen of a Roman Catholic bishop of unimpeached orthodoxy, and well known to be keenly interested in geological inquiries, which treats the first chapter of Genesis as a magnificent poem. We cannot enter here on the vexed question of prophetic inspiration further than to say that Dr. Plumtre does not contribute very much to its solution—though he seems to think he has settled it—by clenching a very cursory antithesis of the twin functions of the old Prophets, moral and predictive, with the "pregnant words" of Bacon—in which Dr. Cumming and Dr. Coleenso might have agreed—that "all prophecy hath springing and germinant accomplishments." As to the critical and historical difficulty, it is fairly enough summarized in the following passage:—

Sacred books have been examined with a microscopic minuteness. The external evidence has been weighed and declared wanting. Internal evidence has been thought to point to very different conclusions as to date and authorship from those which have been commonly accepted. "The Pentateuch," we are told, "was not written by Moses, but is a composite work, in which are embedded the fragments of many ages, from the traditions of the patriarchs to the Book of the Law, which was not found, but written, in the reign of Josiah. The historical books are in like manner anonymous compilations from many volumes of annals and genealogies. Ecclesiastes was written under the Persian or Alexandrian monarchy, and many of the Psalms belong to the age of the Maccabees. The later chapters of Isaiah were the work of a 'great unknown' in the time of Cyrus, and the earlier contain numerous interpolations of the same date. Other prophets have been edited after the same fashion. The first three Gospels have no title to the names they bear, and are not contemporary records. The fourth is the work of a pseudo-Johnes in the second century.

The Pastoral Epistles as a group, and the Second Epistle of St. Peter, are manifestly spurious. It may be questioned whether the same may not be said of the Epistles to the Colossians and Ephesians."

It is interesting to know that, in Dr. Plumptre's opinion, Bishop Lightfoot, Canon Westcott, Archdeacon Watkins, and Canon Sanday have satisfactorily answered these difficulties, though it does not follow that even all the members of the Christian Evidence Society, to whom his words were originally addressed, will be prepared to accept their conclusions on his *ipse dixit*. We agree with him, however, that each objection ought to be examined and decided on its own merits, and that, if it should be proved, e.g., that Deuteronomy was not written by Moses, nor Ecclesiastes by Solomon, all that would necessarily follow would be that personated authorship, apart from the intention to deceive, may be as legitimate within as without the sphere of inspired literature. Whether "it is acknowledged on all hands that"—putting aside records of supernatural events—"the history both of the Old and New Testament stands now on a firmer footing than it did a century ago," may be questioned. No doubt Assyrian, Babylonian, and classical inscriptions have thrown much new light both on Jewish and Christian history. But, on the other hand, modern science and criticism have forged many fresh weapons for the use of the sceptic of which Tom Paine, for instance, with the best possible will to be aggressive, had no inkling at all. It betrays again a happy innocence of popular currents of religious thought to say that "no one now dreams of suggesting"—what was freely proclaimed two or three centuries ago—"that a new translation [of the Bible] must, *ipso facto*, even if a better one, multiply doubts and throw men into a temper of uncertainty." Such doubts may be very unreasonable in themselves, and to allege them as an objection to undertaking the task of revision may be still more so; that is quite another question. But Dr. Plumptre must indeed be living in a fool's paradise, from which a very cursory glance at the religious newspapers of the day might have roused him, if he is unaware that such objections have been loudly urged in many quarters—from Convocation downwards—before the work was begun, and still more since the completion of the most critical portion of it, with its manifold omissions, displacements, and reconstructions of familiar texts. We do not say that such difficulties trouble the serene composure of those learned circles and leading minds with whom Dr. Plumptre affects to be so exclusively conversant that, as we gather from a note, he had written his paper before he became dimly conscious of the existence of a profane vulgar whether of believers or unbelievers. Yet he might have remembered that a conspicuous and influential, if not very discreet, leader in the religious world publicly prayed not very long ago—in reference, if our memory serves us, to this very matter of Biblical revision—to be "delivered from the tyranny of professors."

It is, however, in the last section of his inquiry, where he comes to deal with ethical objections to revealed truth, that Dr. Plumptre's self-complacent optimism reveals itself with the most porplexing *naïveté*. Here "the Apologist" breaks into an almost unbroken song of triumph.

The thoughts that widen with the years, the "survival of the fittest" in the history of dogma, the true development of Christian theology, have removed some of the dark imaginations which once clouded men's vision and views of the Truth of which they undertook to be the defenders. The dark shadow of Augustine and of Calvin no longer rests on our conceptions of the Fatherhood of God. The name of Athanasius is no longer identified with the Damatory Clauses. The dogma that all unbaptized children are excluded from the eternal hope, which made Augustine known as the "durus pater infantum," and which our own Prayer Book but narrowly escaped, has been banished to the limbo of extinct beliefs.

We have ventured to italicize some of the more questionable periods of this lyrical epinicion which seem to share the obscurity as well as the grandeur of a Greek chorus. Is the "dark shadow of Augustine and Calvin" the poetical synonym for the doctrine of predestination or of eternal punishment—both of which are not uncommonly identified with their names—or for what else? In either case the jubilation is a little premature. One of the first English divines of the day—the late Dr. Mozley—wrote an elaborate treatise in defence of the Augustinian theory of predestination, which is still widely held; and Dr. Plumptre can hardly be ignorant that the doctrine of eternal punishment, in spite of the efforts of himself and some of his friends to dislodge it, still retains its place in the creed of the immense majority of Christians. As to the name of Athanasius being no longer connected with the damatory clauses, it is still less clear what is meant. The clauses in question are just as much of course a part of the Creed as they ever were, and it is no modern discovery that the Creed was not actually composed by the father whose name it bears, while recent researches have rather served to establish than to shake its early origin. If Dr. Plumptre means that the Creed, or some particular clauses of it, do not fairly represent the mind of Athanasius, that is a point on which he will certainly find a great many divines fully his equals in learning to differ from him. And as to unbaptized children being "excluded from the eternal hope"—an enigmatic phrase which he has borrowed without explaining it from Dr. Farrar—here, too, there is much room for explanation. If he refers to the tenet that unchristened infants do not enter heaven, that certainly is not "banished to the limbo of extinct beliefs," for it is the received teaching of the Roman Catholic Church, and is, as he himself admits, implied or all but implied in the language of the English Prayer Book. If on the other hand he is thinking of the horrible decretum by which Calvin assigned them to eternal

fire, his language is singularly ill-chosen, and the notion in question has long since been abandoned at least by all theologians. We are told further down on the same page that "we no longer consider ourselves bound to hold a brief, defending the character of lawgiver, patriarch, king, or prophet, as free from infirmities or sins." Considering that grave infirmities or sins of all these personages—notably the sin and repentance of David—are expressly recorded in the Old Testament, it is not easy to see how any one anxious to maintain its divine inspiration should have ever felt bound, or authorized, "to hold a brief" for a view which directly contradicts its testimony. On the other hand, if Dr. Plumptre thinks that now, any more than before, it is open to any consistent apologist of Biblical inspiration to decline to vindicate, as a whole, the character of "the man after God's own heart"—who is also represented as a special type of Christ—and of other Old Testament heroes, from the fierce assaults which sceptical writers are sometimes fond of making upon them, he appears to us to be much mistaken.

But the last, as it is the most vital, so is it also the most vulnerable, point in this optimistic review of the conflict between faith and unbelief. It may be true in the main that "there is an ever-increasing consensus," even among sceptics, as to "the loftiness of Christian ethics and . . . the unapproachable ideal presented by the life of Christ Himself"; though even this would not be granted without very large qualifications by the Positivists, or by such writers as Professor F. Newman; still less, of course, would those who sympathize with the views of "the junior member for Northampton"—and we are afraid they are more numerous than Dr. Plumptre seems willing to admit—"consent" to anything of the kind. But that is not the point we were going to insist upon. If he means to imply that this acceptance, *valent quantum*, of what Strauss called "the moral contents of Christianity" is any sort of guarantee for the acceptance, or even favourable consideration, of Christian doctrines, we can only say that the "combatants" to whom he refers, by whatever name they may be designated, would one and all repudiate such an inference. The very essence of their contention is that the ethical may be, and ought to be, disjoined from the doctrinal contents of the Gospel, and for this reason Strauss, in his latest work, which leaves nothing to be desired on the score of frankness, started with the fundamental question, "Are we Christians?" and answered it in the negative. And if it be replied that the acceptance of this high ideal by leading Agnostics of the day at least appears good security for the permanent recognition of the Christian standard of ethics among their followers, that also is a most unwarranted assumption. In the first place, the leaders of every party are, as a rule, men of higher than average character and principle, which does not suggest even the faintest presumption that in this respect the bulk of their disciples will emulate their example. And in the next place, it must not be forgotten that nearly all the leading Agnostics of the day have been brought up in Christian belief, and although they may have since been led by scientific or other difficulties to renounce their early creed, they could not, even if they would, at once cast off with it all their ethical antecedents; men do not so easily creep out of their own skins. But supposing Agnostic principles to become more widespread and dominant, when a new generation had grown up who never knew anything of the Gospel, or knew only to reject it, the old conditions would be reversed. And there is no ground in experience for anticipating, what Christians, as such, would have less than no reason for assuming, that Evangelical ethics would survive the abandonment of Evangelical faith. One notable exception—and almost the only one—to what was said just now of the Christian antecedents of our leading Agnostics will occur at once to everybody. Mr. J. S. Mill, who displayed many indications of a noble and even Christian character, was studiously trained by his father in the principles of dogmatic atheism; but here again the exception seems to illustrate the rule. Not to dwell on the fact that Mr. Mill senior had himself received a very definitely Christian education, the moral influence of which he could not fail more or less to transmit to his son, and that J. S. Mill himself, though taught atheism from the cradle, was inevitably born and bred in the atmosphere of a Christian country, it is very remarkable that, just in proportion as his character developed, he appears to have gradually and instinctively recoiled from the negative teaching of his youth, and in his posthumous works has left on record his conviction that, in some sense, theism, and even revelation must be considered at least credible. We cannot recognize then in the teaching or example of the leading champions of unbelief any basis for even the faintest presumption that Christian ethics would continue to prevail in a society where Christian faith was defunct. In the closing words of his article, which are the least optimistic, Dr. Plumptre appears to us to touch most directly on the practical bearings of the question, when he insists that "the true difficulties of faith, the most formidable weapons in the artillery of unbelief, are found in the unreality of our lives, the bitterness and triviality of our controversies," and that there would be better hope of success "if to the force of individual example we could add that of example corporate and combined, as seen in an united Church, a re-united Christendom."

## STEAM-YACHT MATCHES.

IN a former article on steam-yacht racing we spoke of the rules by which Mr. Dixon Kemp proposes to regulate the time allowance for racing steamers, and stated that we should return to the subject. We now do so in order to discuss more fully Mr. Kemp's proposals and to see how far they meet the difficulties of the case.

Mr. Kemp's main proposal is, in fact, a formula by which he believes that yachts of very various sizes and powers may be fairly handicapped. His formula deduces from the displacement and horse-power of a steamer a normal or hypothetical speed. The time which one yacht is to allow another in any race is the difference of the times which would be occupied in steaming over the given course, supposing each vessel to steam at her hypothetical speed. Mr. Kemp also gives subsidiary rules by which the displacement and horse-power of a given steamer are to be estimated for the purpose of calculating the hypothetical speed.

The rule for calculating displacement was quoted in our former article, and we have nothing to add to the remarks there made upon it. The rule for estimating horse-power requires some further consideration. The proposal is to take two separate and independent methods of obtaining an approximate value for the horse-power from measurements which may be easily made, and to take the mean of the two results which are thus obtained for what we may call the registered horse-power of the engines—i.e. the number which is to be assumed to be the indicated horse-power for the purpose of calculating the time allowance. The first of these methods assumes the horse-power to be proportional to the sum of the areas of the pistons. This is equivalent to the assumption that the mean pressure of steam and the mean velocity of the pistons are the same in all the engines that are compared. The second method takes the horse-power as proportional to the area of fire-grate. This assumes that the quantity of coal burnt per hour is proportional to the area of the fire-grate, and that all the coal burnt is burnt to equally good purpose. It may be that either of these methods, when applied to a good modern marine engine of ordinary construction, will give a fairly good rough approximation to the indicated horse-power; and it seems not improbable that, when there is a considerable difference between the horse-power as given by the two formulae, the mean of the two results will usually give a better value than either of them separately; since, if the fire-grate area is unusually large compared with the area of the pistons, it is likely that, on the one hand, the fire-grate will not consume to good purpose its normal quantity of coal, and, on the other, that the steam pressure and the velocity of the piston will be above the average.

Still, even when applied to engines of ordinary construction, the results are only rather rough approximations. Mr. Kemp gives a table of the horse-power of thirteen men-of-war of different sizes as calculated by his rule and as actually measured. It appears from this table that the errors of calculation are respectively 32, 24, 10, 7, 6, 5, 3, 1·5 per cent. in excess, and 12, 6, 6, 1, 4 per cent. in defect, and it so happens that the largest errors are in the engines of from 100 to 500 horse-power. Now, considering that a difference of 32 per cent. in the horse-power implies, according to Mr. Kemp's rule, a difference of about 10 per cent., and a difference of 12 per cent. a difference of nearly 4 per cent., in the hypothetical speed, it will be seen that the rule is hardly calculated to give universal satisfaction. It must be remembered, too, that the case will become much worse if yachts are specially built to race under such a rule. It will probably not be difficult to design engines in which the steam pressure and velocity of the pistons are much above the average, and in which, by means of a steam blast or otherwise, the quantity of coal burnt on a given area of fire-grate may be considerably increased. These engines would most likely be very bad—i.e. extravagant—ones; but the racing owner will care very little how much coal he burns if he can only get his engines rated for racing purposes at half their real power.

It is much easier, however, to show that Mr. Kemp's rule for estimating engine-power is defective than to suggest a better one. The only satisfactory measure is the indicated horse-power; but how is this to be determined? Is it to be the power developed during a race? This would probably involve the presence on board each racing yacht of an inspecting engineer, which would, we should think, be thought intolerable, and the rule would also deprive the yachtman of any advantage to be gained by the judicious management of his engines. Or are we to take the power as indicated once for all on trial trips? This would perhaps be the least bad arrangement; but rival owners would probably be unwilling to accept the results of a trial made under the sole management of the owner or builder, whose interest it would be for racing purposes to get his engines rated as low as possible; yet it is more than doubtful whether builders or owners would be willing to hand over their yachts to be tested by a rival firm of engineers, and awkward questions of responsibility would arise in the not improbable event of boilers or engines being injured while under trial. Moreover, such a rule would put a premium on the construction of engines with strange devices which could not be properly worked by one who was not familiar with them; and this again, besides giving an advantage to badly planned engines, would add very appreciably to the risk of a catastrophe on the trial trip, while the attempt was being made to make the monster do its best in strange hands.

But suppose, for the sake of argument, that these difficulties are got over, will Mr. Kemp's fundamental rule enable yachts of different powers to race on equal terms?

Mr. Kemp gets the hypothetical speed by taking the quotient of the registered horse-power by the two-thirds power of the displacement tonnage, multiplying this by a constant, and taking the cube root of the result. The most important assumption here is that the total resistance to motion varies as the square of the velocity, and consequently that the work done in propulsion per unit of time varies as the cube of the velocity. It seems, however, to be more than doubtful whether this holds for ordinary full-powered steam yachts. It is well known that for any vessel there is a certain speed which cannot be exceeded without producing an increase of resistance altogether disproportionate to that which is required to produce a corresponding increase of speed when the vessel is steaming slowly. This maximum speed is that at which the portion of the resistance due to wave-making increases rapidly, and seems to depend mainly upon the length of the entrance and run. For a vessel of given length at the water-line this maximum speed will be greatest for vessels in which the whole length is distributed between entrance and run, so as to leave no middle body of uniform cross-section. For such vessels an approximate rule for determining in knots their maximum speed is to multiply the square root of the length by 1·03. We thus find that the maximum speed for vessels of 150, 100, and 75 feet long on the load water-line would be respectively 12·6, 10·3, and 8·95 knots; and any yacht whose engines are powerful enough to give her a hypothetical speed exceeding the maximum corresponding to her length will necessarily meet with this additional resistance, so that her actual speed will fall short of her hypothetical speed, and she would be hopelessly beaten in a race under Mr. Kemp's rules. Moreover, the best experiments seem to show that at speeds very considerably short of this theoretical maximum the wave-making resistance becomes a very important part of the whole, and the resistance increases with the speed decidedly faster than the square of the velocity. It is probable, then, that in smooth and still water the yachts which would win by time allowance would be very slow indeed. No doubt, on a tideway the case would be different. Suppose the actual speed of two yachts to be the same as their hypothetical speed, and in one case ten knots, in the other eight, these would be equally matched in still water; but the slower yacht would win by 50 minutes over a hundred-mile course with a two-knot tide, and lose by 1 hour 40 minutes over a similar course against the same tide. If the same uniform tide were favourable for fifty miles and unfavourable for the other fifty the slow vessel would lose by 25 minutes. On an average course, wind and tide will probably be unfavourable for more than half the whole time of the race, and consequently the faster yachts would usually gain some advantage from wind and tide, so that the most successful prize winners might not improbably be vessels which nearly attained, but certainly could not be such as exceeded, the maximum speed depending upon the length which has been given above. We suspect that the owners of the smaller classes of steam yachts are not usually content with such speeds as can be economically obtained in a short vessel, but prefer engines which, when doing their best, will drive the hull through the water somewhat faster than it can be driven economically. It would be a paradoxical, but by no means an impossible, result of the adoption of Mr. Kemp's rules that the crack prize winners were yachts too slow for any purpose but racing.

The other assumptions made in Mr. Kemp's formula are that the same proportion of the indicated horse-power is always usefully employed in propelling the ship, and that the resistance is proportionate to the wetted surface of the hull. The first of them gives a perfectly reasonable advantage to improved propellers. The second gives an advantage to large vessels which might be important if yachts of very different sizes competed.

We have before us in the *Field* of March 5, 1881, the particulars of three modern steam yachts of the larger type. It may be interesting to apply Mr. Kemp's formula to them.

If we make use of the actual displacement and the indicated horse-power as observed on the trial trip, we shall get for the hypothetical speeds of the *Fair Geraldine*, *Queen of Palmyra*, and *Marchesa*, 11·2, 11·8, and 9·57 knots respectively; the measured speeds being 11·7, 10·75, and 10·5 respectively. It will be seen that the *Marchesa* wins easily from the *Fair Geraldine*, and the *Queen of Palmyra* is nowhere. If, however, we use Mr. Kemp's rule for estimating horse-power, the case is very different. The cylinder rule gives for the *Fair Geraldine* 405, and the fire-grate rule 660, the mean of these, or horse-power by Mr. Kemp's rule, is 532·5, as against 300 actually indicated. The fire-grate areas of the *Queen of Palmyra* and the *Marchesa* are not given in the *Field*, but the cylinder rule gives 208 and 444·25 respectively, as against 272 and 245 indicated. It is, however, said that the *Marchesa's* engines could easily work up to 300.

Taking 522·5, 208, and 444·25 as the horse-power for the purpose of calculation, the hypothetical speeds of the three yachts are 13·9, 10·8, and 11·7. With time allowance calculated on these speeds, the *Marchesa* still beats the *Fair Geraldine*; but the *Queen of Palmyra* wins the race by almost an hour in 100 miles, instead of losing it by about an hour and a half. These figures appear to be fatal, at any rate, to Mr. Kemp's rule for estimating engine-power. They also, as far as they go, confirm the supposition that the rule favours large yachts with small engines and very moderate speeds.

It may be said, Why not give a time allowance for size only, and take no more account of engine-power than we do of spread of sail in a sailing yacht? Some restrictions must be placed upon the engines, or our racing yachts would become exaggerated torpedo boats, carrying nothing but their engines and coal for a match; yet it is not easy to see what these restrictions are to be. Limiting the space occupied by the machinery would lead to engine-rooms inconveniently if not dangerously crowded. A penalty on burning more than a certain quantity of coal per hour in proportion to the size of the vessel would probably be the best method if it was practicable to obtain a return of the consumption of coal which was above suspicion—but the “if” is an all-important one.

On the whole, it is pretty clear that while no information could be obtained from a race under steam which could not be got just as well from a well-planned trial trip, yachts built for racing under any possible sailing rules would probably differ essentially in some direction or other from those built for any useful purpose, and the chance of any real improvements in the construction either of hulls or of engines arising out of experiments in steam yacht racing is remote indeed.

Fortunately there is little chance of much money or ingenuity being wasted in this direction. In a race under steam there can be nothing of the infinite variety and sustained interest of a good sailing match. When once the course is settled—and it will seldom differ much from a straight line between the marks—there is nothing to be done but to keep up the greatest possible head of steam by some refinement upon the old Mississippi device of sitting upon the safety-valve and throwing the cargo of “hog-products” into the furnaces. Fashion can do much, but it will hardly succeed in keeping up a permanent interest in races the result of which will ninety-nine times out of a hundred be a foregone conclusion, and which, in the exceptional cases in which there is a real race, will be lost or won in the stroke-hole.

GEORGE BORROW.

FEW men without having made a great reputation have exercised a more remarkable influence upon their contemporaries than George Borrow, whose death is just recorded at the age of seventy-eight. He was the son of an officer in the army, and began life as articled clerk to a solicitor in Norwich; but the law had little attractions for him, and his time was chiefly spent in frequenting the society of the gipsy wanderers who are still to be found in large numbers in the eastern counties. The contemplation of their wild life stimulated that propensity for roving and adventure which he displayed at an early age, and which subsequently led him into such a chequered and eventful career. In 1833 he embraced the opportunities for travel which the British and Foreign Bible Society offered to its agents abroad, and went to St. Petersburg in that capacity. Having a wonderful aptitude for acquiring languages, and an especial liking for the less known dialects, he was able while in Russia to edit the New Testament in Mantchu. He next removed to Spain, where the Zincahi or gipsies of that country attracted his attention; and, finding that great affinities existed between their *patos* and that of his Norfolk friends, he applied himself earnestly to the study of the dialect, collecting a large vocabulary of their words and a number of their popular songs and legends, as well as translating the Gospel of St. Luke into the dialect. Spain is not a pleasant working ground for a Protestant missionary or distributor of the Scriptures, and Borrow constantly found himself exposed to inconvenience, and even at times to imminent personal danger. He was twice put under arrest, and on one occasion was obliged to seek shelter in the woods in disguise from the fury of the fanatical populace. Returning to England, he published an account of his work and adventures under the title of *The Bible in Spain*, a book which attracted great attention, especially from the light which it threw upon the language and life of an interesting and hitherto almost unknown race. His next journey was to the South of Europe, where he devoted himself almost exclusively to the investigation of gipsy dialects and manners. On his return he published a book called *Lavengro*, “the Professor,” a romance for the incidents of which he has drawn largely upon his own personal adventures, especially among the Rommany chals, or “gipsy lads,” in whom he took so deep an interest. In this book Borrow unconsciously painted himself in colours which are absolutely true to nature; and, if he appears somewhat pedantic and vain, his manly qualities, his enthusiasm and intrepid courage, more than make up for these failings. *Lavengro* is eminently a romance of the roads—not of ordinary travel, or of coaching, or of railways, as the expression might imply, but of “the roads” in the technical sense given to them by the English “traveller,” or tramp, and describing the strange life of the folk who live, not beyond, but outside of the pale of conventional society.

Until Borrow wrote, the gipsies in England at least, were comparatively unknown. Their language was supposed to be mere cant or thieves' slang, and the constitution of their society was believed to be akin to, if not a survival of, the begging and thieving fraternities and “Alsatian” kingdoms, with which the older novelists have familiarised us, and which M. Victor Hugo has so picturesquely rehabilitated. Bamfylde Moore Carew, the gentleman vagabond, who dubbed himself “king of the gipsies,” was long

looked upon as the model of a gipsy hero, and the doings of his “tramps,” “mumpers,” “thieves,” “beggars,” and “Abraham's men,” were regarded as accurate accounts of gipsy habits. George Borrow's books at once dispelled all these false ideas; the gipsies as he painted them were perhaps hardly more respectable, when judged from the ordinary standpoint, than those of the popular conception, but they were shown to be a national community, with a real language, and not a mere motley horde of vagabonds, speaking the jargon of the prisons and the low haunts of towns.

The later researches of Potts, Miclosich, and others leave no doubt as to the Indian origin of the gipsies, although the exact tribe from which they sprung has not been as yet definitely ascertained. Many of the individual words, such as *páni*, water, are identical in Gipsy and Hindustani; but the grammar of the first-mentioned language, as shown in the mutilated form which remains in English Rommany and the more perfect system of the Turkish Tchingianés, is quite different from most of the modern vernaculars of India, and has but few points of contact with the older dialects. There are in India several tribes whose characteristic habits are very similar to those of the gipsies of England. The Jats, Nathas, and Brinjaris, for example, singularly resemble them; and a very good case has been made out in favour of the first-mentioned as the original gipsy stem. It is an historical fact that somewhere about the year 420 A.D. a number of strolling minstrels did find their way into Persia; they were called *Lûri*, and are described by Firdousi in terms which might equally well apply to a band of English Rommanies. The word “*Lûri*” is still used in Persia for strolling minstrels and vagabonds; while, under the form *Nûri*, it is the generic appellation of gipsies in Syria and Egypt. Arab historians speak of these people under the alternative name of Zutt, which is, with much reason, believed to be a corruption of Jât. The gipsies call themselves everywhere “Rom” or “Romany,” which would point to the “Dom” or “Rom” tribe as their original stock, the initial letter of the word being equivalent to either D or R. These people, who are principally found in Behar, are essentially a roving tribe. Amongst other things which distinguish them from other Hindoo castes is their indifference to ceremonial impurity, such as that which arises from touching a dead body, and their liking for swine-flesh. Now gipsies in Europe are very peculiar in their eating, and are, perhaps, the only race who will eat animals that have died a natural death. *Mullo baulo*, or “dead pig,” is their favourite delicacy; and one of the most typical and amusing of the Rommany ballads which Borrow has collected celebrates the trick formerly so common amongst them of poisoning a pig in order the next day to beg its carcase for food.

Borrow himself, though a skilful linguist, was no philologist, and though his conclusions with regard to the origin of the gipsy language and race are vastly in advance of his predecessors, they are antiquated and erroneous when compared with the researches of later scholars. Thus in his latest work, *Romano Lavo-Lit*, “Word-book of the Romany,” he gives among some correct etymologies others which are simply ridiculous; his collection of gipsy words, too, having been made years ago, cannot compare with the more recent ones of Messrs. Leland, Bath Smart, and others. Still it must be remembered that Borrow was the pioneer of English gipsy lore, and that of all the “Rommany Kyes” who have frequented the tents of the “Caulo chals,” and picked up scraps of that “wisdom of the Egyptians” of which they make such a mystery and parade, there is scarcely one but owes his first introduction to a gipsy tutor to the few words of Rommany which he learnt from Borrow's books. It was not that accurate information about gipsies was altogether wanting, for some few Continental scholars had already worked in the field with good results, but the knowledge of the subject was still in an unsatisfactory state; and in this country absolutely nothing had been done. The works of Crabb and others were written by persons who had never gained the sympathy of the people of whom they treated, and who could, therefore, never really understand them; Borrow, on the other hand, had shared their wandering life, and wrote about them as they lived, moved, and spoke. Of late years gipsy literature has assumed formidable proportions. In 1844, three years after the appearance of Borrow's *Zincahi*, or *Gypsies of Spain*, Dr. A. F. Pott, of Halle, issued a work entitled *Die Zigeuner in Europa und Asien*, which is a marvel of erudition and research. Later on Professor Miclosich, of Vienna, published in parts an exhaustive treatise, *Ueber die Mundarten und die Wanderungen der zigeuner Europas*; and in 1870 Dr. Paspatis published in French at Constantinople a magnificent monogram on the language and literature of the Turkish gipsies with the title, *Études sur les Tchingianés*. The Rommany language is spoken with the greatest purity by the gipsies of the Ottoman Empire, and, as Dr. Paspatis's work exhibits the language in its perfect grammatical form, it is, as it were, the touchstone for testing the other dialects. M. Paul Bataillard has also made a valuable contribution towards the ethnology and history of the Rommany race in his *L'apparition des Bohémiens en Europe* (1844). Of those who have followed Borrow in his investigations of the English gipsy dialect and traditions, the most noteworthy are Mr. Charles G. Leland (Hans Breitmann) and Dr. Bath Smart. *The English Gypsies and their Language*, by the former, is full of information and abounds in humour; while Dr. Smart's *Dialect of the English Gypsies* is a painstaking and most useful manual of the language. A deep insight into gipsy habits and modes of thought, combined with some amusement, may also be obtained from a volume of ballads in Rommany

and English, compiled jointly by Mr. Leland, Professor E. H. Palmer, and Miss Janet Tuckey.

It is perhaps no very great thing to have given the world a clearer idea of what the gipsy race really is; still, everything which tends to remove error is valuable, and we cannot say how useful the study of the most insignificant race may not prove to the cause of philology and ethnology, both of which sciences are, after all, the handmaids of progress and civilization. To Borrow, however, certainly belongs the honour of having first inspired an intelligent interest and incited to scientific research into the facts connected with the gipsy race at large. But his greatest claim upon the sympathy of the English reader is his translation into action and his autobiographical expression of that spirit of adventure and that restless desire for travel and new experience which is the chief characteristic of English youth. The feeling is a healthy one, and if now and then some stirring book of naval adventure sends one boy to sea, or a perusal of Borrow's works drives another to seek the disreputable but instructive society of gipsy vagabonds, no such great harm, after all, is done. At any rate, the career and works of George Borrow are well worthy of study; he may have been "a vagabond" by taste and habit, but he was eminently a Christian and a gentleman, and many men have earned greater name and fame without half his claims to the gratitude of society.

#### THE ABOLITION OF FOG.

THE meeting convened lately by the Smoke Abatement Committee shows that one of the worst nuisances of London life, the blighting and suffocating fog, is now exciting serious attention. Although the fogs of last year were less memorable both in intensity and duration than those of the preceding year, the Society which has undertaken the task of grappling with the evil has not relaxed its efforts. Other and more pressing ills, as frozen water-pipes and snow-invaded dwellings, have not been allowed to hide from view the recurring evil of our grimy and deleterious fogs. The meeting, which was ably supported by men of social and scientific eminence, gave expression to the conviction that the smoky atmosphere in which Londoners pass a good part of their lives is a fertile source of injury to our organisms as well as to our possessions. It disfigures our buildings and stunts our vegetation; and in this way, as well as by excluding the bright rays of the sun for a good part of the year, it gives to our city its unenviable distinction of being the most dismal and hideous of European capitals. It not only disfigures—it destroys. It eats into our textile fabrics, and slowly wears away the masonry of our buildings. Worse than all, it impedes the functions of the organism. An atmosphere charged with particles of unconsumed carbon and sulphur would not seem to be well adapted for the human lungs, and scientific investigation bears out the natural conjecture. The careful analysis of London smoke recently made by a scientific physician enables us to see the real nature of the mixture that we are inhaling, and physiological observation has fully confirmed the theory that the surface of the lungs may become coated with an incrustation deposited by the smoky vapour which is inhaled.

It is easy to treat such a meeting as that held at Grosvenor Place with a measure of ridicule, on the ground that it merely enounces a number of general propositions which no sane person would think of challenging. It seems to us, however, that such a feeling is here out of place. If people were all finely organized and practised in close observation there would be but little need to insist on the magnitude of the smoke nuisance. But this is far from being the case. The effects of causes which are in pretty constant operation are only too easily overlooked. And, as for the disfigurement of our surroundings occasioned by smoke, the familiar truth that what is habitually present to our organs of perception escapes attention here receives a striking illustration. It is not only the coarse, uncultivated mind which overlooks the manifold unlovelinesses of our smoke-covered city. Even a lover of the beautiful may cease in time to note the far-reaching æsthetic consequences of a smoky atmosphere out of which he rarely passes. With respect to the hygienic side of the subject, the same thing holds true. The average citizen, blessed with a vigorous organism, is little likely to trouble himself about the unhealthy character of his atmosphere. A constant stimulus acting on any part of the organism fails to excite a conscious sensation. And the trachea and lungs which are habitually bathed by the murky waves of London fog cease in time to be tormented by them. It may be demonstrable from physiological principles that even a robust organism must be less healthy in such impure surroundings, yet the loss in vital energy is easily overlooked when unaccompanied by positive sensations of discomfort. Now and again, perhaps, when the smoky mixture dignified by the name of air is unusually dense, as in the memorable winter already referred to, even such a hardy person becomes momentarily aware of the deleterious properties of fog; but when the slight feeling of irritation is past, he settles down to his customary proportion of impurities as to something perfectly natural and harmless. Even where these impurities tell upon the health of some more delicately organised member of his family he is very likely to misapprehend the real cause of the evil. In order to refer things to their causes we must be able to compare circumstances in which they are present with those in which they are absent; and the ordinary Londoner who

seldom goes out of town plainly wants the data for reasoning about the subject. It would seem to follow, then, that much remains to be done in arousing the public mind to a sense of the gravity of the evil of living in a smoke-weighted atmosphere.

There seems little good in calling attention to evils which we are unable to set right. It is natural for the mind that is only partially impressed with the hurtfulness of smoke to lapse into the comfortable belief that the evil is in its nature incurable. When we discover that we have all our lives been incurring risks of which we have been totally ignorant, we are at first disposed to acquiesce in the state of things as normal and necessary. A very little reflection, however, will suffice to suggest that as our smoky habitat is an artificial creation of our own, its permanence is a matter which lies with ourselves. In other words, we are led to reflect that this is not a case in which the organism has to adapt itself to a fixed environment, but one in which it is called on to modify its environment. The Smoke Abatement Committee show plainly enough that they take this view of the matter, and that they are bent on supplying a remedy for the evils which they seek to expose. Already, as a consequence of the growing interest in the subject, a considerable amount of ingenuity has been devoted to the practical solution of the question. For some time past we have heard of a number of inventions by which the effects of our smoke-emitting grates may be avoided. The Committee has wisely arranged for an exhibition of the various improved heating and smoke-preventing appliances which have been proposed of late. This exhibition, which will illustrate the proposed substitutes for our smoky grates in actual operation, may be expected to have a double effect. In the first place, people who are indifferent to the evil of smoke can hardly fail to be impressed with its existence and its gravity when they see how much thought and skill have been directed to its removal. And, secondly, if the exhibition is at all a success, it will teach Londoners that the evil is not one which ought to be quietly submitted to as a part of the permanent order of things, but one which lies altogether within our control. The evidence given by Sir Henry Thompson and others at the meeting referred to enables us to anticipate the result of the exhibition so far as to affirm that our houses may be heated, and adequately heated, by a process that is in the fullest sense smoke-preventing. In the face of such a body of authoritative opinion on this point, nobody is likely henceforth to contest the assertion that the smoke nuisance is one which we have the power of removing if we care to do so.

But though it is allowed that Londoners have the power of ridding themselves of their incubus of smoke it may be doubted whether they will care to do so. The cloud of carbonaceous and sulphurous particles which each morning forms itself anew out of the discharges from our forest of chimneys is closely connected with our chosen way of heating our dwellings. In France or in Germany, where the use of stoves obviates the need of constant fires, and where wood is often substituted for coals, our darkening smoke-mists are unknown. We avowedly prefer our open grates, with their cheerful aspect, their socializing influence, their many venerable associations. We know very well that these firesides are costly luxuries, that a considerable fraction of the fuel for which we pay renders us no service whatever. And it may be thought that even when people have come to understand that their habits involve a good deal of injury to health, they will still persist in them. That is to say, they may deliberately prefer the advantages of the blazing hearth to those which would be secured by a smokeless mode of heating; or at least it may be supposed that the force of custom would turn the balance in favour of remaining as we are. In support of this view it has been alleged that the present agitation about smoke is by no means new; that as early as the close of the last century attempts were made to introduce a cleanly and healthy substitute for our open grates; and that since that time the subject has again and again come up for discussion, and then been allowed to drop out of sight.

This pessimistic view of the present attempt to carry a pressing sanitary reform is no doubt a plausible one. We are quite aware that Englishmen are often foolishly conservative, tenaciously clinging to their peculiar habits when they are at least dimly aware of their undesirability. Yet even Englishmen are ready to adopt a new fashion when they are thoroughly convinced of its superiority to the old one. When Londoners are fully alive to all the mischiefs wrought by their dirty atmosphere, they will not, one supposes, long hesitate to accept a more wholesome style of heating their houses. To imagine that they would knowingly set up the sentimental considerations already touched on, in opposition to the substantial arguments of the man of science and the physician, seems to us to misunderstand the English mind. Compared with other nations we are but slightly governed by sentiment, and even the deeply-rooted feeling for the cheerful English fire would probably give way to a clear conviction that its indulgence involves injury to health. And this result will certainly be hastened by the fact that the proposed substitutes for our present thriftless grates are likely to be much more effective and much less costly. It is a part of the irony of the existing state of things that, with all the greater appearance of heat which we gain at the expense of our lungs, we are in reality much worse off than those who use the closed stove. The peculiarity of our English fireplace is that it heats one small portion of a room on the condition of making the other parts chill and draughty. And to this it may be added that we secure this curious result at a much greater pecuniary cost than is incurred by our neighbours. Should all this be fully understood and realized by the majority

of Londoners, they would, we are convinced, soon consent to give up their cherished frosides.

It thus seems that the prospect of removing, or at least greatly reducing, the smoke nuisance really depends on the waking up of the public mind to the existence of the evil. That this will happen immediately we are not sanguine enough to anticipate. The growth of an adequate sense of the loss and positive harm occasioned by the artificial atmosphere with which we surround ourselves will pretty certainly be a slow process. The Society which aims at enlightening the public mind on the subject will accordingly have to harp on the various ill consequences of smoke for a long time to come. Only after frequent reiteration are the salutary lessons which science has to teach fully seized and assimilated by the popular intelligence. At the same time, it is probable that there are forces working in the direction of the Society's efforts. The increase of general information must, one conceives, have the effect of bringing home to Londoners to some extent the pestilential character of their smoke-laden atmosphere. Thus, for example, the publication of the varying death-rate in the metropolis is well calculated to call men's minds to the consideration of the disagreeable subject. It is probable that a good part of the present lively interest in the matter is due to the profound impression made by the announcement that an exceptionally severe form of fog which occurred the winter before last raised the proportion of deaths in the metropolis by a very appreciable interval. In addition to this, all the knowledge which goes to the comparative study of life is contributing to the same result. The more generally Englishmen travel and contrast the surroundings of life abroad with those at home the more likely are they to become alive to the drawbacks of the latter. And even that large body of Londoners which does not go abroad is acquiring, through improved facilities in locomotion, the means of judging the true character of their daily environment. Perhaps nothing will more materially contribute to the growth of a powerful antipathy to London smoke than the rapidly spreading habit of living outside London. A man who, on an average winter morning, enters the City from a point twenty miles distant cannot fail to be struck by the contrast. His breathing organs will be irritated by the impurities to which they have not accustomed themselves; his eye will miss the gladdening rays of the sun and note the depressing hue which the dingy vapours cast on every object. The more frequently the Londoner emerges from his murky mists the less indifferent is he likely to become to their existence. The present agitation of the subject is thus likely to be supported by the action of natural causes. And this fact should encourage the friends of the movement in the face of what are undoubtedly many and serious obstacles.

#### MR. GLADSTONE'S NEW PLAN FOR THE REDEMPTION OF DEBT.

IN preparation for the discussion of his Bill for the redemption of 60 millions of Consols Mr. Gladstone issued last week a Treasury Minute, which very clearly explains the means by which he is to effect his object. There are at present existing Terminable Annuities to the amount of 7,107,571*l.*, of which, in round numbers, about 6 millions will expire in 1885. They were created to pay off debts incurred in various ways; for fortifications, local barracks, through recent war deficiencies, and they were created also for the extinction of funded debt. Apparently Mr. Gladstone is anxious that the whole amount should continue to be applied to the redemption of debt. It is impossible, of course, to foresee who may be Chancellor of the Exchequer four years hence; but, whoever he may be, he will have a strong temptation to purchase a little temporary popularity by remitting taxation instead of continuing to apply the annuities to the payment of the debt. If he should be a weak man, or if his Government should be in need of popular support, he may yield to the temptation, and Mr. Gladstone has taken a step which will take out of his power two millions of these annuities. As is well known, the public will not buy Terminable Annuities. A Terminable Annuity, in fact, consists partly of interest and partly of an instalment of principal; and the purchaser of such annuity, if he does not intend to spend his principal, should be careful to reinvest so much of his annuity as is principal, and to spend only the remainder, that is, the interest. But the great majority of people, even business people, are incapable of calculating how much of the annuity is principal and how much interest. Consequently the Government find few purchasers of Terminable Annuities in the open market, and they are obliged, therefore, to limit this method of paying off the debt to the amount which the funds under their own control enable them to deal with. At present it would seem that Mr. Gladstone has not funds that would permit him to deal with more than 2 out of the 6 millions which will expire in 1885. But it is to be hoped that, if he does not remain in office till 1885, before he retires he will in some way make sure that the sum now set apart for the redemption of debt will continue to be appropriated to that purpose.

As we have said, about 6 millions of the existing Terminable Annuities will expire in 1885, and Mr. Gladstone proposes to prolong 2 of these 6 millions till 1906. His object in doing so is to obtain as much free revenue as will enable him to redeem another 60 millions of the debt. It is calculated by the Actuary

of the National Debt Office that, assuming Consols to be at par, 459,760*l.* in twenty-five years will redeem a sum equal to that which would be redeemed in four years by 2 millions. This will set free a revenue of 1,540,240*l.*, by the assistance of which Mr. Gladstone proposes to cancel stock to the amount of 60 millions sterling. When the 60 millions of Consols are cancelled and converted into Terminable Annuities, the interest upon these 60 millions will also be set free, amounting to 1,800,000*l.* In this way Mr. Gladstone obtains a total annual sum of 3,340,240*l.* But it is estimated by the Actuary of the National Debt Office that an annuity of 3,428,604*l.* will pay off 60 millions of Consols in twenty-five years, and as we have just now seen, Mr. Gladstone by prolonging his annuity of 2 millions from four to twenty-five years, and by cancelling 60 millions of Consols, has obtained an annual free revenue of 3,340,240*l.* He needs, therefore, only 88,364*l.* to make up the Terminable Annuity required to pay off in twenty-five years the 60 millions of Consols, and this sum, therefore, is the only addition to be made to the permanent charge of the debt for the extinction in twenty-five years of 60 millions of Consols. In other words, by simply prolonging for one-and-twenty years 2 millions of the Terminable Annuities now existing, and by adding to them somewhat less than 89,000*l.*, Mr. Gladstone is enabled to cancel and pay off 60 millions of the debt. As we have explained above, he is able to do this only because there are held by officers, under the control of the Treasury, Consols to the amount of 60 millions; 20 millions of these are held by the National Debt Commissioners on account of the Savings Banks, and 40 millions are held by the Chancery Paymaster. When 20 millions are taken from the Savings Bank account, the National Debt Commissioners will still hold 11 millions of Consols, besides 7½ millions of Exchequer Bonds and various other available securities. They will therefore have ample means to meet any demand that may come upon them in the way of withdrawals of deposits by the Savings Banks. In ordinary years the deposits on account of the Savings Banks exceed the withdrawals, and as we may hope that we are now entering upon a cycle of good years, it is to be expected that the excess will be larger than usual. But, even if this should not prove to be the case, and if the withdrawals should be larger than is anticipated, the National Debt Commissioners will still have an ample margin to meet all the calls upon them. Mr. Gladstone devotes a large part of his Minute to prove that the interest of the suitors in Chancery are equally well cared for, and his proof is complete. We need not go into this part of the Minute in detail here. It will be enough to state roughly the principal points. Stock held by the High Court of Chancery has steadily increased in the past. Between October 1, 1847, and August 1879, the stock so held increased from 46,796,000*l.* to 61,886,000*l.*, an increase of over 15 millions, or more than 33 per cent.; and there is every reason to believe that it will go on increasing. In fact, as the wealth of the country grows, it is evident that funds coming under the administration of the Court of Chancery must grow with it. There is every assurance, therefore, that the Court of Chancery will continue to hold a sufficient amount of stock to meet any demand that may be made upon it. But, to make assurance doubly sure, Mr. Gladstone, in concert with the Lord Chancellor, takes elaborate precautions to secure that, if more stock should be needed, it shall be at once forthcoming.

The direct and indirect effects of this conversion of Consols into Terminable Annuities must be very great. In the first place, it is a kind of pledge that the Government will not allow any part of the Terminable Annuities now existing for the extension of debt to lapse or to be applied to other purposes, and, consequently, that the redemption of debt will proceed at a very rapid rate henceforward. In itself alone this must have a great influence on the market. It will tend to give a new impulse to the rise in Consols which has been going on for some years. But, furthermore, the measure will directly increase the purchases of Consols by the Government officers. As we have just been explaining, 60 millions of Consols are to be cancelled at once; but their place must be supplied by the National Debt Commissioners and by the Chancery Paymaster by the re-investment in Consols of each instalment of capital as it is paid. In the new annuity of 3,428,604*l.*, as we have just seen, 1,800,000*l.* in the first year will be interest, and the remainder repayment of principal. After the first year, however, the amount of the interest will go on steadily decreasing, while the amount of the principal will as steadily increase, until, as we reach the year 1905, almost the whole of the annuity will be repayment of principal, and the interest will dwindle to a vanishing point. If, at the same time, the remaining 4 millions of Terminable Annuities which are to expire in 1885 are prolonged, the effect will be enormous, and the price of Consols must rise to a point which will admit of the reduction of the interest on the debt to 2½ per cent., unless, indeed, a war or some other great calamity should compel the Government to create Consols more rapidly than it buys them up. While these purchases on the part of the National Debt Commissioners and the Chancery Paymaster are going on, the Government itself will also be buying if the trade improvement continues, and we once more have surpluses of revenue over expenditure. The Government purchases, it is true, will be for the Sinking Fund, and the amount so bought will at once be cancelled, whereas the purchases by the National Debt Commissioners and the Chancery Paymaster will be on behalf of the Savings Banks fund and the suitors in Chancery, and will remain intact. But the effect on the open market will be the same in both cases, for the amounts bought by the National

Debt Commissioners and the Chancery Paymaster will not be sold again, except in the rare cases where the withdrawals by the Savings Banks or repayments to the suitors in Chancery necessitate sales. As a rule, however, the purchases made by the National Debt Commissioners and the Chancery Paymaster are real withdrawals of Consols from the open market, and diminish by so much the supply of Consols for the public. While this is going on, the public will also be purchasing. There are large classes, such as trustees, who must invest in Consols. Banks also are bound to hold a certain portion of their reserves in Consols, and so are other great establishments like insurance offices. Their purchases will add to the effect of the purchases by the Government and by the National Debt Commissioners and the Chancery Paymaster, and will tend to raise year by year the price of Consols. As we have already said, the accumulated effect of all these purchases can be neutralized only by a great war, or some other circumstance which would compel the Government to issue large amounts of Consols. The Irish Land Bill, no doubt, will, to some extent, cause a new issue of Consols. If that portion of the Bill which proposes to establish a peasant proprietary in Ireland is largely acted upon, the funds advanced by the Commissioners must be furnished by the issue of Consols, and, therefore, it may be argued that the new supply in the market will go to neutralize the increased purchasing. But it is doubtful whether this will be so. If large numbers of the Irish landlords sell their estates, it is probable that they will prefer to take in payment Consols rather than money. They will not be inclined to re-invest in Irish land, and as the interest returned upon either English or Scotch land will not be greater than the interest yielded by Consols, they will have no inducement to encumber themselves with the management of property when they can have as large an income free from care of every kind by simply continuing to hold Consols. We are inclined to doubt, therefore, whether the Irish Land Bill, however much the clauses establishing a peasant proprietary may be availed of, will increase the supply of Consols in the market. A great war undoubtedly would increase the supply and neutralize the effect of Mr. Gladstone's measures; but anything short of a great war will have little effect. For every year the growth of population and of wealth is increasing the demand for Consols, and the cancellation of 60 millions of Consols at once and their gradual replacement by the accumulation of another 60 millions in the hands of the National Debt Commissioners and the Chancery Paymaster in the course of five-and-twenty years must have an immense effect, without speaking of any of the other influences to which we have been referring above.

#### THE THEATRES.

IT is not very long since the old question of indebtedness of English to French playwrights was revived in a somewhat amusing fashion, and the revival led, not unnaturally, to a certain amount of gossip, both particular and general, concerning this old story. Amongst other things, it was at the time stated or hinted that a certain play, which had seemed to all the London critics to give the lie to the assumption that it was impossible for an English play-writer to invent a well-constructed plot, was, in fact, borrowed from a French source. The play was a play by a clever actor and playwright, Mr. Pinero, and the title assigned to the French play from which he was supposed to have borrowed was curiously in harmony with the theory that his English play was not original. Indeed, the title given to the French play appeared at once to explain a certain oddity in that of the English one. The theory was so plausible on the face of it that we thought it worthy of investigation, and the result of careful investigation is that no play bearing the title which was given out is known to those who are best qualified to speak with authority upon the subject in Paris. If any additional proof of Mr. Pinero's capacity to construct such a dove-tailed plot as many Parisian dramatists delight in is needed, it would be found in his play called *Imprudence*, lately produced under Mr. Carton's management at the Folly Theatre. Mr. Pinero has suffered to a certain extent, as all followers of any art do suffer, because he has not chosen to do the same thing over and over again. He wrote an emotional play, which achieved a well-merited success, and he has followed it up with an almost entirely comic play, which, in its line, deserves equal success. He had before this produced one or two little pieces, which were not in their essence pathetic; but it seemed to be expected that, if he ever committed himself to more than one act, he would have to go in for the serious side of life. In other words, his versatility seemed, in the eyes of some critics, a fault rather than a merit. What he has done in the case of *Imprudence* is to produce a piece as neatly and funnily constructed as are the many French plays of the same calibre which have of late years given much gain to translators, and a piece which differs from those just referred to in that it has no offence in it. It has, instead, various touches which remind one of Mr. Pinero's success in another line, and which, according to some critics, seem out of place in a play of which the chief motive is unrestrained comedy. We are not ourselves of opinion that they are at all out of place; on the contrary, the few discreetly introduced touches of real feeling complement admirably, to our thinking, the generally amusing, and it may be said reckless, character of the work. We are introduced to a purely comic state of society, and to characters who for the most part are purely comic; and it has

been contended that they should be throughout purely comic, and nothing else. Mr. Pinero is rightly, as we think, of a different opinion. His play is full of what may be termed farcical incidents, but he has made it more than a farcical comedy by introducing a certain vein of emotion. The emotion is lightly touched by the author, and is given with equally commendable lightness by the players, and it serves, as it seems to us, to maintain on the part of the spectators an interest which might possibly flag without it. Three acts of mere smartness and farce have before now been known to be wearisome. It is surely to the credit of author and actors that *Imprudence* is the reverse of wearisome.

The action of the piece passes in a boarding-house, which has some resemblance to the one depicted in *Sketches by Boz*. It is curious, and it is also a tribute to the playwright's verisimilitude, that the characteristics of boarding-houses have changed comparatively little between the days of "Boz's" sketch and the present time. People who have frequented or visited boarding-houses of this day will see that the atmosphere of *Imprudence* is very far from being exaggerated. While many of Dickens's pictures of manners and customs are antiquated, his earlier and later sketches of boarding-house life are still in the main true to nature. The author of *Imprudence* probably knew that he would be taxed with borrowing from Dickens, and it is his merit that he has not shirked this danger. The events which follow each other in rapid succession in Mrs. Lazenby's boarding-house are improbable enough, and their very improbability is a source of amusement; but the *entourage* which makes such events possible for dramatic purposes is, we take it, as true now as it was many years ago.

To give in any detail the plot of a comedy of intrigue like *Imprudence* would be to spoil the pleasure of spectators. The piece depends mainly upon a skilfully arranged series of bustling situations, relieved, as we have hinted, by a few passages of emotion, to which excellent justice is done by those concerned. The weight of the performance, if we can speak of weight with regard to a thing essentially light, rests upon Mr. Carton, the actor-manager, who, by the fitness and the force of his playing, more than confirms the high opinion which we have ventured to express of his powers on former occasions when they had less scope. He is admirably supported by Miss Compton, by Miss Kate Bishop, and, it may be said in fine, by every one concerned in the representation of a piece the stage-management of which is as good as the acting. Of the general nature of the play we have perhaps said enough. It may be added that the dialogue, for the most part, is as neat and terse as the construction. One or two pleasantries might, however, be cut out with decided advantage.

#### MIDSUMMER RACING.

THE first race of importance which followed the Ascot meeting was the Northumberland Plate at Newcastle-upon-Tyne. As the event proved, it was anything but an exciting affair. Mr. Jardine's Bonnie Doon was a very strong favourite, and he won in a canter by five lengths. This horse had been a high-priced yearling, but he had not been able to run as a young horse on account of an accident. At the Libby Club and the Stockbridge meetings Lord Stamford's good two-year-old filly Geheinniss, by Rosierucian, showed fine form. Her winnings by the end of the Stockbridge week exceeded 2,500 guineas, and she had run four times without being beaten. Charibert, who has turned out an extraordinary horse over short courses, won the Stockbridge Cup. In the Queen's Plate Petronel beat Exeter, after a very hard-fought race. Exeter was the favourite, and the race was run at a good pace over the long course of two miles. There was a fine race, again, for a biennial, in which that uncertain horse Scobell beat Thora by a neck. In the following week came the July Stakes at Newmarket, one of the great two-year-old races of the season. The first favourite won, but only after an exciting race, by half a length. The winner is a brown filly of Lord Rosebery's, named Kermesse. She is by Cremorne out of Hazeldean. Hazeldean was by that very game horse Cathedral, out of Nutbush, who was one of the fastest fillies of her time. Some judges think Kermesse a little small, while others consider her large in all those parts of a racehorse where size is most necessary; some point out the excellence of her head, neck, and muscular, well-placed shoulders, the symmetry and power of her back, loins, and quarters, and the perfection of her lengthy, low, galloping action; others contend that her forelegs are too light and straight to endure the wear and tear of training, or even the force of her own great speed in racing. Marden, who was second, had run nowhere at Stockbridge to Geheinniss, although it is only fair to say that he was then carrying 4 lbs. extra weight; and in the July Stakes he beat St. Marguerite by half a length, while at Stockbridge he had been some distance behind her. St. Marguerite is own sister to Thebaia, the winner of the Oaks of this year. In the July Stakes she ran a dead heat for third place with Dutch Oven, a filly out of the dam of the famous Bal Gal. It was rather singular that sisters of the two most celebrated two-year-olds of last year should run a dead heat for a very forward position in the July Stakes of this year. The next day St. Marguerite won the valuable Chesterfield Stakes in an easy canter by a length; and

week later Dutch Oven won the Great Lancashire Yearling Stakes at Manchester, a race worth nearly 1,500*l.* But, to return to the Newmarket July meeting, we may observe that Peter, the hero of the late Ascot meeting, made another exhibition of temper in the July Cup, and would not attempt to race with Charibert, although it may be an open question whether he could have beaten Charibert over six furlongs, even if he had tried.

The prospects of the Goodwood meeting were much clouded by the prevalence of severe influenza and coughs in several large racing stables. It had been hoped that Bend Or and Robert the Devil would have met again, but both horses were attacked by colds. Their owners set admirable examples by scratching their horses as soon as there seemed to be no hopes of their being able to run. It is a pity that this line of conduct is not more often followed by owners of racehorses. On the first day of the Goodwood meeting the principal two-year-olds already mentioned, with the exception of Gelchunius and Marden, met again in the Richmond Stakes. Kermesse was the favourite, and St. Marguerite, Dutch Oven, and Purple and Scarlet were estimated in the order given. There was a grand race; Kermesse in the middle, with Dutch Oven and St. Marguerite on either side, raced from the distance almost abreast, and at last Dutch Oven won by a head, Kermesse and St. Marguerite running a dead heat for second place. Now Archer was riding Dutch Oven, and in our humble opinion this may have been enough to account for the victory by a head. Kermesse was giving each of the other two fillies 4 lbs., so it is possible that she may still be a trifle the best of the three. Dutch Oven is a fine well-made filly, but there were reports in circulation to the effect that, like her half sister, Bal Gal, she was a roarer. It is a curious fact that out of the five races for the Richmond Stakes which have taken place since its institution in 1877, four of them have been won by horses (or rather fillies) belonging to Lord Falmouth, and that each of the five winners of the race has been ridden by Archer. The Goodwood Stakes was a disappointing race, as it was won by a lightly-weighted selling-plater called Brown Boes; but there was one unusual feature of the race—namely, that it was run during a terrific storm of lightning, thunder, and rain. Between the brilliant flashes of the lightning and the blinding downpour it was almost impossible to see much of the race. There were several very hardly fought contests during the day, and for five of the races there were good fields. Altogether the opening day of the Goodwood meeting was far better than the racing public had been led to expect.

The Sussex Stakes, on the Wednesday, was won by Limestone, after a fine race with Geologist. Skipetar was third. The stakes were worth 1,517*l.* The winner is a fine horse, about 16 hands high, and he became fourth favourite for the St. Leger after his victory in the Sussex Stakes. Twenty-eight horses ran for the Stewards' Cup, which was won by Mazurka, who had been one of the triple dead-heaters for the Astley Stakes at Lewes last year. She is small but beautifully shaped, and has great strength in her back and loins, while her shoulders are just what they ought to be to produce great speed. The Lavant Stakes ended in a fine race, Archer winning very cleverly by a length on Baliol, a son of Blair Athol's, who was running for the first time. This colt was not by any means universally admired by judges of horseflesh, some considering him too narrow, with but second-rate fore-legs. Sutler, who has won a good many races this season, ran very gamely in the Visitors' Plate; for, after appearing to be beaten, he struggled on, and, wearing down his opponent, won by a head. There was a fine struggle again in the following race, Osborne, on Privateer, getting the best of Archer on Passaic, the first favourite. Archer made one of his scientific rushes, but he was beaten by a head. Out of the seven races that were run on the Wednesday five were well contested, and in most cases there were good fields. The weather was all that could be wished, and everything tended to make the day a pleasant one, but, unfortunately, in the evening there was a fatal accident on the drive home, in which two lives were lost.

On the Thursday there was a fine race for the Corinthian Plate between Sword Dance and Kuhleborn, the former, ridden by Archer, winning by a very short head. The Racing Stakes was the cause of much interest, because Privateer and Passaic, who had run a close race for the last event of the preceding day, were now to meet again under the same jockeys and under similar weights. In spite of his defeat on the previous day, Passaic was again made first favourite, and once more there was a tremendous struggle. The form of the Drawing Room Stakes was, however, exactly confirmed, for Privateer again won by a head, although Archer exerted all his skill on Passaic. Peter was a strong favourite for the Goodwood Cup, and it was generally believed that the result depended entirely upon the state of his temper. To people's astonishment, however, all four competitors were restive at the post; indeed, Madame Du Barry and Fernandez behaved even worse than Peter. These four matured racehorses were more unruly before their two-and-a-half mile race than many large fields of two-year-olds before a T.Y.C. scramble; but when once they did get off they went away on very equal terms. All went well until they reached the Craven starting post, where Fernandez began to run unkindly, and refused to try any more. Before they came to the Mile post Peter also grew tired of the performance, and planting his toes firmly into the ground, he indulged in a hearty kick, and then sidled off into the gorse. Madame Du Barry and Nottingham were now the only horses left in the race, and the former had no difficulty in winning by twenty lengths. This was a miserable

result after the early promise of a terrific encounter between Bend Or, Robert the Devil, and Peter. After the Cup came the Rous Memorial Stakes for two-year-olds, a race worth 1,737*l.* Pursebearer was the first favourite. This appeared reasonable enough, for in the Great Lancashire Yearling Stakes he had run within three-quarters of a length of Dutch Oven, and now he was to meet her on 15 lbs. better terms. When they came to the distance, Dutch Oven was running very kindly, but although Pursebearer was struggling gamely, he was evidently beaten, and Dutch Oven won by a length, St. Marguerite being two lengths behind Pursebearer. The day ended by another display of wickedness on the part of Peter, who, after odds had been laid on him for the Singleton Stakes, stopped soon after the start, and deliberately engaged in a kicking bout.

In the opening race of the last day backers were almost clever enough to place the four runners in exactly the reverse order to that in which they came in. Carlyle was the first favourite, at 2 to 1; 5 to 2 was laid against Baliol, 10 to 1 against Forget Me Not, and as much as 20 to 1 against Adrastus. There was a magnificent race; but it was not at all in accordance with the anticipations of the prophets, for Adrastus won by a head from Baliol, who beat Forget Me Not by a head, Carlyle, the first favourite, being absolutely last, half a length off. The Chesterfield Cup was won from a large field by Victor Emmanuel, who won the same race last year. His victory was a surprise, as 16 to 1 had been laid against him at the start. In the last race of the meeting, Thebnis, the winner of the One Thousand Guineas and the Oaks, gave Bal Gal 12 lbs., and beat her by fifteen lengths. Before the Goodwood meeting it was expected that the racing would be very far from first-rate, and that the fields would be small; but, as the event turned out, the meeting was a decided success; there was excellent racing, plenty of horses ran in most of the races, the course was in capital order, and the weather, with the exception of one thunderstorm, was all that could be desired.

## REVIEWS.

### LES QUATRE VENTS DE L'ESPRIT.\*

THERE can be but little hesitation in deciding that, of the various divisions of M. Victor Hugo's latest volumes of poetry, the most important are "*Le Livre Dramatique*," "*Le Livre Lyrique*," and "*Le Livre Épique*." "*Le Livre Satirique*" is, it seems to us, too coloured by personal impressions, too full of matter which has not in itself, and to which the poet has not imparted, any marked originality, to make it worthy of a place among that great portion of his work which should and will live. It has more or less wild tirades against institutions which M. Victor Hugo has persuaded himself that he disapproves of *en bloc*; it has two impersonal dialogues, which do not show the author at his best; and it has one poem which shows him in his least discreet, considerate, and reticent mood, and the publication of which can hardly but be regretted by such of his admirers as are not fanatical. To say that, in spite of its many shortcomings, it contains fine lines and passages is perhaps unnecessary. But it is certainly not what we should recommend to a friend to whom we wished to prove the greatness of M. Hugo's imagination and power.

"*Le Livre Dramatique*" has the sub-title of "*Les Deux Trouvailles de Gallus*," and consists of two dramas which are complementary to each other, and both of which show at their best the poet's grasp of character and power of giving incisive expression to his deep thought. The scene of the first is laid in "*Un burg dans une forêt. Intérieur de la grande salle en rez-de-chaussée. Aspect de ruine. Le dénuement rustique mêlé au délabrement seigneurial.*" The words "*En Souabe, 17—*" follow the short list of characters, of whom Le Duc Gallus and his chamberlain, Baron Gunich, are the first to appear. They have come on the trail of a beautiful girl named Nella, who lives with her father in this curious *taudis*; and, in the course of the opening conversation between them, we learn that Gallus is a usurper, who has long ago hidden away his nephew, the rightful Duke, in the woods, and who is not now particularly content with the result of his act of usurpation. The throne, he says, is "*une triste proie*," and continues:—

Sais-tu ce que je suis ? un pauvre homme de joie,  
Plutôt bon que mauvais ; très canaille ; occupé,  
Mais oisif ; fort penaud. Comme on est attrapé !  
L'ambitieux pensif, usurpateur en herbe,  
Dit en prémeditant le trône :—C'est superbe !  
On est le maître ; on a le budget plein les mains ;  
Le prince resplendit, regardé des humains,  
Au-dessus de la terre ; il est dans la comète !  
Vite, ôte-toi de là, petit, que je m'y mette !—  
C'est bon, j'ai pris la place, et je régné. A quel prix !

Les vastes battements du céramonial ;  
Beaucoup d'enterrement mêlé d'un peu de bal ;  
Le rang suprême, un mot ; le pouvoir, un problème ;  
Ne jamais être sûr qu'une femme vous aime,  
Voilà ce qu'on usurpe, ami.—Si j'avais su !

\* Victor Hugo. *Les Quatre Vents de l'Esprit*. Paris : J. Hetzel ; A. Quantin.

As the result partly of this particular mood, partly of what a contemporary critic has aptly described as his perverse corruption, Gallus's present design is to find an innocent and charming girl, and watch her progress to evil. The speech in which he avows this intention is charged with the same terse cynicism which is apparent in the curiously accurate description of his own character from which we have just given an extract. It presently appears that Gallus has a rival already, in the person of George, the nephew before referred to, whose only doubt as to the success of his suit arises from his belief that he is of plebeian, while Nella is of patrician, birth. There is a charming love-scene between the two, marred only by one touch of self-conscious prudery on her part which is essentially French; and then Gallus proceeds to pay his court to Nella, and to be repulsed by her with admirable simplicity and wit. Finally, Nella orders him out of the house; and almost at the same moment George and Nella's father, Baron d'Holburg, whom political pressure has reduced to his humble state, appear on the scene. Gallus warns the father of the courtship carried on clandestinely by George, who at last turns on him with a speech ending

Tu te rétracteras syllabe par syllabe !  
Ton nom ?

I.E. DUC GALLUS.

Je suis Gallus, landgrave de Souabe,  
Le frère du feu duc régnant George premier.  
L'aigle à deux têtes prend son vol sur mon cimier.  
L'Allemagne n'a pas de famille plus grande.

Il salue profondément le baron.

Et, monsieur le baron d'Holburg, je vous demande  
En mariage ici votre fille Nella,  
Pour mon neveu le duc George deux.

Montrant George.

Que voilà !

There is one very happy touch in the course of Gallus's vain attempt to win Nella for himself when he, as if by accident, lets his coat fall open, and displays his orders :—

NELLA.

Monsieur, si vous croyez me faire de l'effet  
Parce que vous ouvrez votre habit de manière  
A montrer un crachat sous votre boutonnière,  
Et dans votre gilet le coin d'un cordon bleu,  
Vous vous trompez.

Then, showing him a full-length portrait of a field-marshal covered with decorations, she adds, "Voici mon grand-père." Here there is, it seems to us, a curious instance of that dramatic *flair*, which, combined of course with far greater qualities, has availed to make of so ludicrously constructed a play as *Hernani* a drama which is notwithstanding so admirably effective. Along with this dramatic instinct we find in *Marguerite*, as the first play in "Le Livre Dramatique" is headed, numberless beauties of insight and description which it is impossible to do more than briefly refer to.

In the second drama, which is called generally *Esca*, and is subdivided into *Lison* and *La Marquise Zabeth*, we have Gallus still on his strange quest, which in this instance, in one sense at least, is more successful than the former one. This time he comes in the forest upon a clever and fascinating peasant girl named Lison. She is an orphan and penniless, and is betrothed to the comparatively rich husbandman Harou, for whom, however, she has no real love. She is of a fantastic and romantic turn of mind, has dreams of luxury and splendour, and cherishes the notion of the sudden appearance of a fairy prince to save her from her fate. As she prepares her bridal toilet she reflects that

L'œil est d'autant plus doux que la main est plus blanche,  
L'amour, dit l'Amadis de Monsieur de Tressan,  
C'est la vie. Et je hais le parler paysan.  
Ouvrière. Orpheline. Oh ! je songe, et Dieu laisse  
Entrer dans mon œil trouble un regard de duchesse.  
Et j'ai des visions folles, plaire, charmer,  
Être libre, être belle, être adorée ! Aimer !

The chance quickly comes of realizing some of these visions. Gallus is on the watch, and so arranges matters that Lison finds herself actually living in her dream of the fairy prince, with luxuries and splendours rising as if by enchantment around her. The prince himself, however, though brilliant enough—she takes him at first for Satan—is not young. At the end of the act she makes her choice between Harou's reeking cart and Gallus's magnificent chariot. "Mais," she asks as it comes on the stage, "à qui donc ce carrosse ?"

GALLUS.

A vous.

LISON.

A moi !

Le carrosse s'arrête. Gunich ouvre la portière. Gallus abat le  
marche-pied et y fait monter Lise éperdue.

GALLUS.

Viens ! c'est . . . ta voiture de noce !

In the second act Lison, now known as *La Marquise Zabeth*, is installed in a splendid house in Paris. She has crowds of real or pretended admirers, some of whose slighting phrases concerning herself she overhears from time to time and notes with a marked eagerness. Gallus meanwhile occupies himself in devising every kind of scheme for her gratification, but carefully avoids letting her know that he is so employed, and with practised cynicism denies to Gunich the imputation of having allowed his heart to be really touched by his new acquisition. In the end Zabeth dismisses the crowd of fops who flutter about her, and, left alone with

Gallus, lets loose her passionate misery in one of the finest dramatic speeches that M. Hugo has ever written. It is, unhappily, too long for quotation in its entirety. She ends, having drawn a picture of what her life is and what it might have been, with the words :—

Vous étiez prince et vieux, deux choses que je hais,  
Eh bien, pourtant, peut-être, hélas ! nos vains souhaits  
Gardent au fond de l'ombre une porte fermée,  
Je vous aurais aimé si vous m'aviez aimée !

GALLUS.

Mais—

ZABETH.

C'est fini. Silence ! Avoir rêvé le ciel,  
Et s'éveiller avec l'arrière-goût du ciel,  
Et de tous les affronts sentir qu'on est la cible !  
Hélas ! vous m'avez fait le cœur noir et terrible,  
Soyez maudit.

Then, before Gallus can prevent it, she poisons herself with a ring that she has filched from him.

GALLUS.

Ciel ! mais c'est un poison ! la mort terrible et prompt !

ZABETH.

Boire la mort n'est rien quand on a bu la honte.

Elle s'affaisse sur un fauteuil.

Adieu ! je prends mon vol, triste oiseau des forêts.  
Personne ne m'aima. Je meurs.

Elle expire.

GALLUS.

Se jetant à ses pieds.  
Je t'adorais !

It is, of course, impossible by means of comments and extracts to do anything like justice to the deep and fine impression produced by the play, which has, it may be mentioned in passing, a curious likeness to Musset's best work. The names of two players at the Théâtre Français who might give it admirable interpretation on the stage may probably occur to many readers. That it is admirably fitted for stage representation—with, of course, some trifling alterations—will be obvious to any one who takes the trouble to consider the matter.

We have left ourselves comparatively little room wherein to speak of "Le Livre Lyrique" and "Le Livre Epique." The former is as full of beauty, tenderness, and imagination as any of the poet's former work in the same direction. One extract, however, must suffice :—

Un hymne harmonieux sort des fouilles du tremble ;  
Les voyageurs craintifs, qui vont la nuit ensemble,  
Hautent la voix dans l'ombre où l'on doit se hâter.  
Laissez tout ce qui tremble  
Chanter.

Les marins fatigués sommeillent sur le gouffre.  
La mer bleue ou Vésuve épand ses flots de souffre  
Se tait, dès qu'il s'éteint, et cesse de gémir.  
Laissez tout ce qui souffre  
Dormir.

Quand la vie est mauvaise on la rêve meilleure ;  
Des yeux en pleurs au ciel se lèvent à toute heure ;  
L'espoir vers Dieu se tourne et Dieu l'entend crier.  
Laissez tout ce qui pleure  
Prier.

C'est pour renaitre ailleurs qu'ici-bas on succombe,  
Tout ce qui tourbillonne appartient à la tombe.  
Il faut dans le grand tout tôt ou tard s'absorber.  
Laissez tout ce qui tombe  
Tomber !

To the splendid conception and execution of "Le Livre Epique" it is quite impossible to give anything like an adequate notion within our limits. The daring idea of the midnight march of the three statues, headed by that of Henri Quatre, is just such an idea as M. Hugo alone of living poets can handle with the power and, in some sense, the restraint necessary. In his estimate of the characters of the dead kings he is, it need hardly be said, completely unfettered by purely historical considerations. But that is no check upon the tremendous swing and force of the verse that carry the reader completely away, and make him see before his eyes the terrible ride that the poet describes. We are tempted to quote the terse and dramatic conclusion of this fine work; but it is perhaps best that readers should know it either in its entirety or not at all.

#### CORAL ISLANDS.\*

MR. COOPER'S *Coral Islands* is a most pleasing book, written with vivacity without flippancy, and equally interesting to the ethnologist, the capitalist, and the general reader who only wants to be amused. The author has lived for some years among the innumerable islands of the Pacific, in the middle of a mixed world of trade, lotus-eating, cannibalism, and orthodox dissent. He is convinced that the "Anglo-Saxon" has a great work to do in the Pacific Islands, and that the capitalist will eventually find there particularly excellent business. Yet, though he has a noble eye for the main chance, Mr. Cooper is not one of those irritating colonists who think that the chief end of the white man is to make money in a hurry, and the chief end of men, not white, to be used up as "labour" in the process. He is entirely on the side of Sir

\* *Coral Islands*. By H. Stonehewer Cooper. London: Richard Bentley & Son. 1880.

Arthur Gordon and his policy in the Pacific—a policy which, if successful, will enable the native races to escape slavery on one side, and the fate of the Red Indians and Australians on the other. Mr. Cooper knows that his defence of the Governor of Fiji will irritate many personal friends of his among the planters. But he has seen both sides of the question, has estimated the interests concerned, and seems to have no doubt that the policy of governing as if coloured races had a right to exist in their own islands is the wise and just one.

Mr. Cooper is not a professed ethnologist, and much of his information about the past of the half-civilized races, and about their traditions and religion, he borrows from Ellis, Mariner, and others. But his testimony as to the actual condition of the lower races is authentic and at first hand. He follows Mr. Whitmee, a missionary, in his division of the peoples of the Polynesian Islands into three stocks. First we have the Papuans, "a black, frizzly-haired people, who are the lowest type of humanity in existence." We do not think the Papuans are quite so low. Regnard says that, next to the monkey, the Laplander is the animal which most nearly approaches man. Papuans seem a better developed set of people than Laplanders. Mr. Cooper says the Papuans "possess few of the traditions, poems, and songs common to many barbarous races." But Mr. Codrington has lately published many very valuable examples of traditions from the Melanesian Group, where the people, on the whole, are Papuan. Wherever one finds Papuans they are more or less mixed with a "large, brown, straight-haired people," especially in the Fiji group, which is minutely described in Mr. Cooper's work. The large, brown, straight-haired people Mr. Whitmee calls "Sawaioi," a word made up out of a syllable each from Samoa, Hawaii, and Maori. The Sawaioi are very polite, and much given to ceremonial. The chiefs, like the blessed gods in Homer, speak a language different from that of ordinary mortals. "In Samoa there are four different words for 'to come,' appropriated to four grades of people—*sau* for a common man; *makin mai* for a person of respectability; *susu mai* for a titled chief; and *afio mai* for a member of the royal family." The third of Mr. Cooper's and Mr. Whitmee's races is styled Tarapon, and its members are brown in colour, but smaller than the Sawaiois. They chiefly inhabit the Gilbert and Caroline groups. Mr. Whitmee thinks that the ancestors of all these peoples originally lived together in the isles of the Indian Archipelago. But to consider this would be to consider too curiously.

The Pacific Islands are no longer very distant from civilized lands. A run of seven days brings one from San Francisco to Honolulu, the capital of the Hawaiian kingdom. Some American missionaries first tried to Christianize the Hawaiians; but Kamehameha ordered them to throw themselves from a mountain peak as a test of the divinity of their message. This was illogical, for the truth of a string of metaphysical propositions cannot be tested by jumping off a rock. The American missionaries, therefore, declined to jump, and Hawaii remained heathen. As we all know, Kalakua is now king, and he has an army of no fewer than two hundred efficient soldiers, armed with the Remington breechloader. We must, therefore, try to avoid quarrels with Hawaii, as they could only end in object apologies on our part. The Hawaiians, like the Boers, are averse to labour, and import Chinese coolies, who have no reason to complain of their wages or their lot.

The Fiji Group is much more important, and Mr. Cooper believes that it will prove a most valuable possession. Viti Levu, the largest island, is larger than Cyprus, and even the second island is ten times as big as Barbadoes, while the whole area of the isles is greater than that of the British West Indies. Fiji was ceded to England by the desire of Cacobau the king, or one of the kings, and Maafu, "the Bismarck of the Pacific," in 1874. The natives have not yet insisted on its being restored, so it still remains a jewel in the British crown. Cacobau had various reasons for giving up his sceptre; the chief, perhaps, was that the Americans had established an ingenious claim against him, a claim, according to our Commissioners, "unfairly made and unfairly pressed, and which has led to speculations of a questionable character." The speculators were natives of Melbourne. The white settlers in Fiji were also anxious for annexation, though, now they have got it, many of them do not like it. The introduction of measles in 1875 by her Majesty's ship *Dido* was an act of atrocious carelessness, which produced the most miserable results. In 1876 there was a "final cannibal outbreak," the conservative highland tribes attacking and eating a number of native Christians. Mr. Cooper takes a sanguine view of the future of civilization and of Christianity in Fiji. If the recent accounts of a massacre by Christians be correct, we may have reason to fear lest the natives, like the Boers and the Maoris, should exclusively adopt the early Hebrew theory of the duty of massacre. Levuka, the capital of Fiji, has made great strides in civilization, and possesses a cricket-ground and a School Board. There is also a "Temperance Hall," but rigid abstainers are still in a minority. One Fijian chief boasts that he drinks a bottle of brandy every day, which, in a hot climate, seems to approach excess. Another commonly manages two bottles of gin, which he drinks out of a cocoa-nut shell. And yet the native population of Fiji is not increasing. Chickens and turkeys and beef are cheap. In Levuka mullets are killed, we regret to say, by dynamite. But the great charm of Levuka, after the pools beneath the waterfalls where people bathe, is the entire absence of tall hats. There is not one in the colony, and the only specimen was pitched into the sea.

Fijian and Samoan legends of the Creation are very much like our own. They have the Flood, Cain and Abel, and so forth. Mr. Cooper is half tempted to see in these traditions some faint remains of Hebrew influence. But, as the stories are common to almost all known races, it seems safer not to speculate on the influence of the Mosaic history. Among the sacred stones, as common in Fiji as in ancient Greece, was one which always had a little pebble when any woman of rank was confined in the Fijian capital. The mother-stone was taken away when Christianity was introduced, but the pebbles remain to testify to the thing.

So much has been written lately about Fijian cannibalism by Miss Gordon Cumming and others that we need not quote Mr. Cooper's account of revolting practices. He himself dislikes the topic. He gives a very amusing description (vol. i. p. 96) of the want of rancour displayed by warlike Fijians. "I tried to shoot you," one of them said to Mr. Harding, speaking of a battle, "but you put a revolver bullet through my hand. My brother shot you in the breast, and then you shot him with your little gun between the eyes. . . . You killed my uncle, but my cousin put a bullet through your shirt." The Fijians, like other southern people, are supposed to use poisoned arrows in war, and they certainly do their best to venom their arrow-heads, which are usually made of sharp human bones. But the experiment of inoculating rabbits and other animals with the poisons used has been tried, and the results seem to show that these are not really efficacious. If a native has been hit by the arrow of a man who has *mana*, or magical power, he gives himself up for lost, and dies accordingly.

The "labour question" and the question of taxation are the great practical problems of Fijian life. It is not easy to ascertain how far "blackbirding" or cooley-stealing prevailed before the annexation. Mr. Cooper's own accounts of the matter seem rather inconsistent. At present the Governor does his best to secure the return of imported labourers to their homes when their term has expired. Mr. Cooper thinks that these half-civilized returned emigrants raise the moral tone of their neighbours. It is certain that the Solomon Islanders seem to have become rather more than less savage during recent years. An amusing story is told of an imported Polynesian nurse who returned to her own people after she had served her time. A "recruiting agent" met her, and asked her if she would return to Fiji.

"Well," said the girl, "I like it, but I don't know if my pa will let me go."

"Oh, I see the old folk live here, eh?"

"My pa live here, but ma's dead."

"Oh, how did the old lady die?"

"Gentleman come visiting, and pa get jealous; so he fight and kill ma, then he put her in a *lovo* (or oven) and pa and his friends eat poor ma all up."

The Fijians are at present obliged to pay their taxes either in labour or in kind. This plan does not at all suit the white planters. The natives can only get money by working for the planters, and, if they were obliged to pay taxes in money, for the planters they would be compelled to work. Now the article of commerce known as copra was, according to Sir Arthur Gordon, sold to Government by traders at 10*s.* 10*s.* 6*d.* a ton. For the same article traders paid natives 5*s.* a ton. Thus, if the native is taxed ten shillings worth of copra annually, he has only to pay 10*s.* 10*s.* 6*d.*; but, if he had to pay ten shillings in money, he would have to sell 22*½* lbs. to the trader to raise his half-sovereign. So far, then, the native has the better of the bargain under the present system. A planter admitted to Sir Arthur Gordon that the natives "are very much better off than they were three years ago; but he added that this was by no means an advantage to the planter, whose difficulties in obtaining labour were thereby materially increased." It may be inferred that Sir Arthur Gordon is regarded as a pulsing humanitarian by the majority of planters. But Mr. Cooper entirely approves of his policy, as a consequence of which, he says, Polynesian labourers are now flocking to Fiji, a country which they previously distrusted.

Mr. Cooper gives a long list of Fijian products, and a business-like appendix with a tariff of customs. In his opinion the islands offer a great field for capital. "What Fiji requires is, in fact, an aristocracy of planters, who will add to a very natural desire to create a competence a keen sense of responsibility to all around, whether white or coloured." Working-men and City clerks are not wanted; the latter are "a nuisance in Fiji." Men should have, at the very least, a capital of three or four hundred pounds. From personal knowledge of the subject, we can say that a small capital and a stout heart did not by any means lead to wealth in the earlier and more unsettled days of Fiji. Things may be improving, doubtless are improving; and Mr. Cooper writes:—"I am inclined to think that there is no colony of the British Empire where a young man, coupling a reasonable amount of brains with a moderate capital, can so easily secure a competence as in Fiji." Mr. Cooper adds plenty of practical hints for emigrants. The rest of his book—his account of beach-combers, pirates, of the pearl-fisheries, of the monuments on Easter Island—is as entertaining as his chapters on Fiji are instructive.

## MY SISTER THE ACTRESS.\*

THE duties of a reviewer of novels are not always disagreeable. He occasionally meets with works worth reading, and then to give short accounts of the leading points of the stories, so as to excite the reader's curiosity without allowing it to be gratified until he shall have procured and read the books for himself, is pleasant work enough. There is also a pleasure in giving a few well-selected and amusing extracts, which shall keep the anxious reader's mind from starving until he may succeed in getting the novel from the circulating libraries; and there is an art which, if not easy, is decidedly agreeable, in writing an article that shall tell readers enough of a book to enable them to talk about it without spoiling their interest in reading it for themselves. It is always pleasanter, moreover, to praise than to blame, and a critic who says a good word for a book has the double satisfaction of reflecting that he has done a service both to the author and to the herd of readers who are always wanting to know of some book worth sending for. There would be no use in disguising the fact that there is also some pleasure to be derived from reviewing an exceedingly foolish book. There are novels published in these days containing such surpassing nonsense that they amuse by their very absurdity, and, if not witty in themselves, they become the cause of wit in others. Unfortunately there are other novels which come under neither of these descriptions. There is one kind especially which it is neither pleasant to read nor to review. This is the thoroughly vulgar novel. In some instances novels of this sort are decidedly clever and provokingly amusing. There are many passages, for example, in *Soapy Sponge* and *Plain or Ringlets* which can scarcely fail to amuse, although they may irritate. But there are novels which are both vulgar and weak, irritating and dull.

On the fourth page of the first volume of the book before us we read that "it is so difficult to be vulgar when you never open your mouth." We beg to differ. There are people who find it exceedingly easy to be vulgar with closed mouths, when they have pens in their hands. Of all kinds of vulgarity, that connected with chambers of death and funerals is to our thinking the most nauseating. In the fourth and fifth chapters of the book under notice there are descriptions of a most unpleasant death-scene, the preparations for a funeral, the visits of friends to the laid-out body, the carrying of the coffin downstairs, the assembling of the mourners for the funeral, the summoning of the bearers, the carrying of the body out of the house, and the marshalling of the party into the mourning coaches. We read of "a faint pervading odour of eau de Cologne," of "deep erape veils," of a "buxom widow" "decorously draped in the deepest mourning," of "the coffin with its silent inmate," of the "marble image," "the Silent Presence," and "the funeral guests." We were almost tempted to think as we finished the fifth chapter that *My Brother the Undertaker* would have been a more suitable title for the book than *My Sister the Actress*. We are bound to say that there is nothing more about funerals in the succeeding chapters, and we were not without a certain feeling of relief when the heroine's mother, who is spoken of as "the sick lady," died, and had the advantage of a respectable funeral. Unfortunately she leaves a sister behind her, a woman who had a "gushing, affectionate heart," as well as several other relations whom the author might with advantage have buried decently in the early chapters while in a burying humour.

The heroine is, of course, my sister the actress, who performs some of those noble actions which it is so easy to make heroines perform in a novel. She marries the right man at last, although she treats him in rather a scurvvy manner in the second volume. At one time she falls deeply in love with a "beautiful man," who is "as handsome as a star," and "looks as if he had just stepped from his bath perfumed and anointed, and put on everything fresh and clean." This beautiful man's "arm steals round her lissom waist," when she gently remonstrates with "Pray don't! Indeed you mustn't." After this backstairs sort of scramble there is no saying what might have happened if the perfumed and anointed beauty had not bolted with the bosom friend of the lissom waister. The accounts of the heroine's attacks of love-sickness—for they deserve no higher name—read very like descriptions of indigestion. In chapter ix. we find her "lying on her bed, face downwards, with a vast new feeling pervading her breast." The idea of a vast new feeling pervading the breast is sufficiently horrible, but we pity the heroine still more when we read that "there is a hard lump in her throat" "and a heavy weight upon her bosom." Her affection for the young man who looked as if he had just stepped from his bath attained to such a pitch at one time that we are told she had a "heart welling over with love" for him. When her pericardium is in this overcharged condition she is apt to be violent, for we read that "she flings herself into his arms with a passionate gesture." Although we are told most about her bosom, her breast, and her heart, we are informed, in the early part of the first volume, that she also had a brain. One of her friends describes her as "disgustingly clever," and she takes five prizes on one day at school, or rather at "college." English grammar must have been rather neglected at this college, for the five-prize-taker says to a friend, "Surely you will never marry him—not if you hate him"; to another person she says "Never you mind"; and she has a charming sister who says "I couldn't, not now."

\* *My Sister the Actress*. A Novel. By Florence Maryat (Mrs. Francis Lean), Author of "Love's Conflict," &c. 3 vols. London: White & Co. 1881.

\* While the heroine is deeply in love with the anointed beauty, she accords some minor attentions to a gentleman to whom she is engaged to be married; indeed, in one place we read that "she takes, at this juncture, almost to courting" him; although at other junctures she flirts outrageously with the anointed one, and she "cogitates earnestly with her heart what to say to him next." Her love passages with the man whom she eventually marries remind one of that peculiar social arrangement known to servants as "keeping company." She was not particularly in love with him, but she walked regularly with him in Hyde Park, and he was allowed to consider her to a great extent his own property; but she was much relieved when something happened to save her for a time from listening, "with a callous ear to his long-winded tale of love," and from being "called upon to give him kisses on demand, or to sit close to him on a sofa and pretend to like it." The youth who tells the long-winded love tales is the son and heir of a baronet, but he astonishes us by telling the heroine when he meets her accidentally in the country that his "father's seat" is only three miles off. Hitherto, we have never enjoyed the felicity of knowing any young men who talked about their "father's seats," but on this point the author has the advantage of us. The happy youth had a very prudish old grandmother. We were prepared for any amount of stiffness and primness in this old lady, and were consequently not a little surprised when, talking of evening dresses, she asked what she called her favourite riddle. "When is a lady not a lady? When she is a little bear!" It will be perceived that even the Grundism of these volumes is peculiar; but then all the characters in the book are quite different from what the author calls "the *oi polloi*." Even their surroundings are not as those of other mortals. We are told of "a bright May day, warm, sunny, and perfumed." We confess that we are not æsthetic enough to wish for a perfumed day. Hitherto, indeed, we have never experienced one; but we remember once reading in *Punch* of a barber out on a holiday, who told his wife that the scent of the wild flowers reminded him "of the most delicious 'air-oil'." A large proportion of the characters in this novel are the kind of people whom one would expect to be redolent of peppermint and patchouli, and their days would probably be perfumed in that sense of the word. It is satisfactory to read of mansions "replete with every luxury, and provided with an ample retinue of servants," but one cannot help wondering what manner of people speak after this fashion. Perhaps this sort of fine language may be common among "an ample retinue of servants." We do not think it necessary that we should give a sketch of the plot of the story. It will be perceived that we have refrained from offering any criticism on the book, as we have thought it sufficient to point out what seem to us to be its leading characteristics. We cannot pretend to say whether *My Sister the Actress* will be much read. In these days there appear to be people who will read any description of rubbish.

## WARD AND LOCK'S ETYMOLOGICAL DICTIONARY OF THE ENGLISH LANGUAGE.\*

THE now forgotten Etymological Dictionary by "N. Bailey, Φιλόλογος," which long held its place as the guide and instructor of intelligent country squires, states on its title-page that it has been "compiled and methodically digested, as well for the Entertainment of the Curious as the Information of the Ignorant, and for the Benefit of young Students, Artificers, Tradesmen, and Foreigners, who are desirous thoroughly to understand what they speak, read, or write." Messrs. Ward and Lock have evidently aspired to bring out a new Bailey, "a Popular and Comprehensive Guide to the Pronunciation, Parts of Speech, Meaning, and Etymology of all Words—Ordinary, Scientific, and Technological—now in General Use." They have not indeed, in emulation of Bailey, undertaken to give "our most common Proverbs, with their Explanation," but in exchange—an ill exchange, as some may think—they have given interpretations of the penny-a-liner's favourite scraps of Latin, French, Italian, and Spanish. This part of the book we own that we wish away. We "hold that man the worst of public foes"—from a philologist's point of view—who does anything to encourage the spread of that polyglot jargon which is so dear to the London correspondents of country newspapers and to the authors employed by enterprising cheap tailors. But letting this pass for the moment, we are glad to see the appearance of this etymological Dictionary. It is a sign of a healthy state of things when "young Students, Artificers, Tradesmen" are desirous thoroughly to understand what they speak, read, or write. It is a good sign too, when the average Englishman, for whom Messrs. Ward and Lock's cheap publications are intended, takes sufficient interest in his own language to care about its etymology. And as far as we have been able to test it, the guide now offered to him is a fairly trustworthy one—why by the way could not the author of the pre-

\* *Ward and Lock's Standard Etymological Dictionary of the English Language: a Popular and Comprehensive Guide to the Pronunciation, Parts of Speech, Meanings, and Etymology of all Words—Ordinary, Scientific, and Technological—now in General Use*. With an Appendix, comprising I. Abbreviations used in Writing and Printing. II. A Brief Classical Dictionary, comprising the Principal Deities, Heroes, Notable Men and Women, &c., of Greek and Roman Mythology. III. Letters: how to Begin, End, and Address them. IV. Words, Phrases, and Proverbs from the Latin, frequently used in Writing and Speaking. V. Words, Phrases, and Proverbs from the French, with English Translations. VI. Words, Phrases, and Proverbs from the Italian and Spanish, with English Translations. With 500 Illustrations, illustrative of Various Words, Names, and Processes. London: Ward, Lock, & Co.

face have contented himself with the good word *trustworthy* instead of the barbarous *reliable*? There is of course much that is open to criticism; for the matter of that, etymology is a growing and still imperfectly understood science, and the utmost that can as yet be said of any etymological dictionary is that it contains fewer errors than its predecessors. When the long-promised dictionary which is to be the result of the labours of the Philological Society appears, we may hope, not indeed to arrive at perfect knowledge, but to know all that is to be known at the time on the subject. Meanwhile we have nothing which holds an equal place with Littré's great work. We cannot go the length of saying that the book before us is even as good a compilation as could possibly be made. Except in some few happy instances, popular works lag some little way behind the point attained by the foremost scholars, and this Dictionary is not altogether an exception to the rule. "Reference," the compiler tells us, "has been made to all the best English Dictionaries of modern times, including those of Webster, Worcester, Ogilvie, and many others that are generally accepted as reliable authorities"; but we see no traces of acquaintance with Littré and Brachet, whose dictionaries should, of course, have been consulted for all words derived from or akin to French. In short, we do not consider this a first-rate work; but it is a fair performance of the second class, and—which, after all, is considerable praise—will do more good than harm.

Our criticisms begin with the wish that Messrs. Ward and Lock could, consistently with cheapness and profit, allow their readers a larger, or at least a blacker and less crowded type. Learning is most excellent; but short sight is, as the Germans are beginning to feel, a heavy price to pay for it. As however we have already lifted up our voice with reference to the same firm's reprint of Cobbett's Grammar, we say no more. The "Introductory Remarks" of the compiler next engage our attention. He judiciously disclaims any intention of asserting that his work

embraces within its pages every word that may be introduced into a so-called English Dictionary; for it is possible to swell the bulk of a work of this kind to almost any extent by bringing in words which are nothing more than words from ancient and modern languages in an Anglicised form, which are useless in themselves, inasmuch as they are not in use at all, and in all probability never will be.

With this remark any one will agree who knows the multitude of "inkhorn terms" with which Bailey and others of his class swelled out their works, and which have been slavishly copied by one compiler after another. The claim of the present work is that "it contains every word whose meaning it is necessary that a well-read and well-educated Englishman should know," which is perhaps rather too strong an assertion on the part of a book which confines itself to "terms now in general use." The well-educated Englishman should be familiar with the Bible and Prayer-book use of "*prevent*," as in the collect, "Prevent us, O Lord, in all our doings," or in the Epistle to the Thessalonians, "we which . . . remain unto the coming of the Lord shall not prevent them which are asleep." "Anticipate," the explanation here given, hardly expresses its full meaning. He should know that *riches* was originally a singular noun, so that he may not blame the Revisers of the New Testament, as we have lately seen them blamed, for retaining in Colossians i. 27, "To whom God would make known what is the riches of the glory of this mystery." *Teen* (sorrow), as a Shakspearian word, should have a place in his Dictionary. Here we only find the colloquial sense of "Teens, years between twelve and twenty." Of course there are dangers on the other side. It was doubtless by referring to some dictionary which gave only the archaic sense of *teen* that some ingenious Frenchman was led to translate the opening words of *Vanity Fair*, "The present century was in its teens," as "*le siècle était dans les larmes*." *Terrier* should be given in its legal as well as its canine sense; and *barb*, meaning a Barbary horse, should not have been left out. As it is, the inquirer who is curious as to the nature of the gallant barbs which appear in company with the heroes of Scott and Byron, has to take his choice among the "beard or something resembling it," arrow-heads, fish-hooks, and horse-trappings.

The Introduction, from which we have already quoted, contains some useful grammatical notes. It would, however, have been better to describe the indefinite article *a* as a contraction of the original *an*. To repeat the statement of the old grammars that "*an* is used for euphony," &c., confirms the common and erroneous impression that *a* has been lengthened into *an*, instead of *an* being shortened into *a*. Strong and weak verbs should also have been explained; the compiler is content with the old notions of regular and irregular. In the matter of etymology the plan followed has been "that of giving one, two, or more words to which each English word can be positively traced, or from which, by reason of its apparent affinity, it may fairly be supposed to be derived." The compiler adds that in some cases "the derivations given are intended merely as being suggestive." For a popular work it would, we think, have been a better plan, in the case of words coming direct from the Old-English or "Anglo-Saxon," to have given the earliest form, without encumbering the learner with German, Dutch, Latin, or Greek cognates, and to have shown the stages by which it passed into its present form. The tendency of the plan actually followed will be, we fear, to confirm the learner in the common notion that modern English is as nearly related to German, Dutch, or even French, as it is to "Anglo-Saxon." The one thing that ought to be got into people's heads, if possible, is that modern English is simply "Anglo-Saxon" in a later stage of growth. Glancing over the

etymology, we note that in one or two cases the actual parent of the word under consideration has been omitted, though the more remote ancestor is named. The Latin *albus* is given as the source of *albino*, without any mention of its immediate Spanish or Portuguese origin. So *amour* is assigned to *amor*, without any hint that it is pure French, and only Latin at second-hand. *Introit* should have had its direct origin, the Latin *introitus*, acknowledged, before it was analysed into *intro*, *itum*, and *eo*. We doubt whether *ancient*, in the senses of flag and flag-bearer, should be traced to *ancien* and *antiquus*. It is more probably a corrupt form of *ensign*. The common derivation, here adopted, of *antimony* from *anti-moine*, because some unspecified monks were poisoned by it, has a very apocryphal sound. It would have been better to derive it from the barbarous Latin *antimonium*, which Littré has traced to Arabic and Greek sources. Littré should also have been consulted for the etymology of *albatross*, *arsenal*, *bastard*, *carcanet*, and *escort*. The last, which is here assigned to the Latin *cohors*, really comes, through the Italian *scorta* and *scorgere*, from *ex-corrigere*, to direct. *Capetan* is rightly traced through the French to the Latin *capra*; but it should have been explained that *capra* is to be understood as an engine, not literally as a goat. On the other hand, the compiler has been wise in placing *lark*, a frolic, in connexion with *lark*, a bird, instead of following those who attempt to trace it to the Old-English *læcan*, to play, which lives in the North-country dialects as *layke*. Attractive as this etymology is, it seems very doubtful whether it can be justified on any sound principle. Why under the head *Ban-dog* the reader should be referred to *Ban* we cannot tell, as none of the meanings assigned to that word have any obvious connexion with a dog. At the same time it must be admitted that the more usual explanation of *Ban-dog*, *quasi band-dog*, i.e. dog tied up, is not very satisfactory. We must give the compiler due praise for explaining *decimate*, *dilapidate*, and *oration* accurately; and his interpretation of *transpired* in the figurative sense as "become known or public," is a fair one, though the Johnsonian interpretation, "to escape from secrecy to notice," would have been preferable. Our modern newspaper-writers have quite forgotten that the idea of escaping, exhaling, oozing out as it were, is conveyed by this word; and a witness cannot so much as give his name and address without its being reported that "it transpired" that his name was John Smith of such and such a place. English usage must, we suppose, excuse *forte* and *morale*, though a Frenchman would write *fort* and *moral*—that is, if he was speaking of the *moral* of an army. "Moral condition; mental state, as of men, especially in time of trial," is the explanation here given. This is properly *la moral*; *la morale* being morality, which is a different thing. In the phrase "on the tapis" it would have been well to explain that *tapis* here means a carpet in the sense of a table-cloth, not of a floor-cloth. *Enceinte* is oddly described as "the projecting part of any system of fortification"; perhaps *surrounding* was meant, though even this would not make much sense. *Cap-à-pie* is given twice over, once in the English part, where it is in its place as an English idiom taken from old French, and again in the glossary of avowedly French phrases, where it should have been noted that modern French usage demands *de pied en cap*. But this glossary altogether requires correction, for we find in it *A l'outrance*, *C'est en fait de lui*, *Coûte qui coûte*, *Le mot d'énigme*, and that barbarous piece of English-French, *double-entendre*. By what rule it has been settled that one thing is French and another is English we cannot make out. *Hors de combat* is placed among English words, while *peine forte et dure*, which has at least an English history, is relegated to the French glossary. It is as well that in this latter part the compiler has abandoned the attempt to teach pronunciation, though in the body of the work he does his best, with but moderate success. *Any-bow-prow* does not seem very happily to represent the sound of *emboupoint*, nor *hor de kong'bar* of *hors de combat*. In the cases of *abbé* and *employé* the learner might have had a better chance if the words had been printed with their accents. To come to an English word, it would not have struck us that *A-gam* conveyed the proper sound of *agone*, but we admit that we have not heard the word used in ordinary conversation. At any rate, we part in charity from the compiler, seeing that he has been careful to mark the proper sound of the *wh* in *what* and *where*.

#### VOLCANOES.\*

PROFESSOR JUDD modestly announces himself in the preface to his present excellent work as the scientific executor of the late Mr. Poulett Scrope in carrying forward the knowledge and investigation of the subject to which that eminent geologist devoted so much of his life. Many years have elapsed since Scrope's death, and since he worked and wrote much has been done to enlarge and confirm the basis of facts and observations upon which must rest any true theory of volcanic action and of the cognate phenomena of earthquakes. Very extensive additions have been made to the relative geographical information by ascertaining the position and mutual bearings of active volcanoes in all regions of the globe, the number of which, and of what may be called semi-volcanic districts, is far greater than was formerly supposed. A more precise and differential examination

\* *Volcanoes: What they Are and What they Teach*. By John W. Judd, F.R.S., Professor of Geology in the Royal School of Mines. London: C. Kegan Paul & Co. 1881.

has been made of the various rocks and minerals which are the slow results or immediate products of volcanic energy, and these are now better understood and more correctly classified than was formerly the case. Chemical analysis and microscopic work have also contributed to an improved knowledge of their real constitution and of the probable conditions under which they have been evolved and have assumed their present aspects. The latest instrument of research, the spectroscope, has lent its aid, and assisted in the comparison between what is actually going on in the interior of and upon the surface of our own planet, and what has been or is being transacted in the sun and other bodies of the great system to which the earth belongs. Above all, the history of the past has been carefully looked up, read, and digested, so as to explain much of what would be inexplicable, if attention were only directed to modern or recent exhibitions of volcanic action. In this, as in other departments of physical science, the immense advantage is to be noted of a concentrated attack by different branches of the service, so to speak, belonging to the powerful army now enlisted in that great warfare in which the conquest of truth is the only glory and the annexation of fresh facts and of more extended inductions is the most coveted prize.

It is nearly a century since Spallanzani visited and described the volcanoes of Italy, and these have since engaged the attention of other eminent men; but it was not until the year 1826 that Scrope's well-known treatise gave the first systematic view of the subject. It was Spallanzani who pointed out that the nature of volcanic action remains the same, however much its intensity may vary from time to time; and if this is accepted as a central truth, a great advance will be made in the facility of grouping around it many phenomena which otherwise might seem to be at variance with each other, and indeed not to belong to the same order of things. All subsequent discovery and reflection have tended to confirm this axiom. Stromboli has for the whole historical period of two thousand years been in a state of constant activity, but has never broken out into the violent eruptions which have distinguished Vesuvius and Etna, nor has it ever relapsed into absolute quiescence or extinction. Its accessible position and comparatively tranquil behaviour have always made it a desirable spot for the study of volcanic life. There may be seen all the familiar sights and sounds of the volcano; the crater and the lava stream, the ejected showers of molten rock, assuming the form of scoriam as they cool in falling, and the enormous evolution of steam, which forms the huge masses of so-called smoke which hang over a volcano during eruption, and is the most probable source of the vast mechanical power which lifts the column of fused mineral matter from its subterranean reservoir and drives it over the lips of the brimming cup. Thence it runs down the sides of the mountain within which it has risen, still apparently smoking and bursting with included steam, to ravage the neighbourhood, to be the terror of the day, and to become in after ages the instruction and wonder of the future geologist, under the form of a basalt, a trachyte, or of some other plutonic rock.

The general history of the volcanic centres which have been most under observation tends to show that long periods of inactivity are followed by eruptions of long duration or of great violence, and the reverse. Feeble and brief eruptions succeed at short intervals; and, as a rule, the violence of a great eruption is inversely proportional to its duration. This sort of intermittent action obviously resembles that of the Geyser springs in Iceland and elsewhere, which may fairly be described as hot-water volcanoes, and to a considerable extent it is consistent with the supposition that the actual eruptive manifestations of volcanic force are due to the escape of high-pressure steam, imprisoned in the interior of the earth, and waiting for an opportunity of diminished pressure to escape. Unquestionably steam does bear a considerable part in eruptions; and the unseen operation of water at enormous temperatures, and subject to immense subterranean pressure, must be held to assist in the widely-spread modifications of the earth's crust, of which volcanoes and earthquakes are the casual and not the most important indications. But much more knowledge is required before the steam theory can be definitely accepted, although it presents a greater aspect of probability than any other yet put forward and supported by observation, and in his final discussion of various hypotheses Professor Judd is extremely careful in weighing the facts already collected, and refrains from giving any absolute opinion. A recent writer in the *Quarterly Review* throws out the suggestion that the volcano and the earthquake owe their existence to some hitherto unsuspected action of electricity, while at the same time he ignores the evidence of the elevation and depression of certain tracts of the earth's surface, which must be admitted and considered in connexion with any rational theory of volcanic action, and without which it cannot, in all its generality, be explained.

The microscopic examination of thin slices of various lavas has discovered unexpected points of difference in their internal structure, and has even aided to some extent in determining the date of their formation. They present much difference in their composition and texture, from that of a simple glass or obsidian to that of rock like granite, made up entirely of large crystals. The vitreous lavas also sometimes take the shape of pumice, which is nothing but the filaments or powder of glassy lava consolidated, but with innumerable cavities. The pumice of commerce is a direct natural manufacture of the Mediterranean volcanoes, from

one of which the necessary supply is always obtained. The most important conclusions to be derived from an investigation of the crystalline interior of lava, and from experiments upon the artificial fusing and cooling of such small portions as can be so operated upon, are those which prove the time necessary for the cooling of lavas and the great pressure to which they must have been subjected. Further evidence of enormous pressure, either exercised by steam, or by the lateral thrust of adjoining rocks, or by the weight of superincumbent mineral masses, is afforded by the existence of fluids as found in the minute cavities which abound in many kinds of crystals. Each of such cavities contains some liquid and a bubble of gas, like that of air in a spirit-level; and the obvious inference is that the crystals must have been formed under a pressure capable of reducing to a liquid form some of the most volatile kinds of such matter as is usually found in an æriiform state. The further prosecution of these inquiries will not only tend to throw more light on the nature of lavas, recent and ancient, but to advance our knowledge of the way in which crystals in general, and especially metallic and mineral veins, are formed. All our precious gems are probably due to volcanic action, and to the slow crystallization under enormous pressure of small portions of some of the materials which exist in another state in the greatest abundance. Diamonds are crystallized carbon, and it is known that the largest recent discovery of them has taken place in the midst of an old volcanic region of South Africa; the ruby and sapphire are crystals of alumina; the amethyst and a number of other gems represent silica.

The more recent and familiar exhibitions of volcanic agency are well described, and Professor Judd's treatise gives an admirable account of all the most celebrated eruptions, including the remarkable elevation of Monte Nuovo to a height of 440 feet in the space of two days and nights, which affords one of the best known and most instructive instances of rapid volcanic work. More novel matter is devoted to the description of less familiar but still active volcanoes, and to the studies which have now been made of extinct craters, and of the evidences of ancient volcanic action in times which are old even when reckoned according to the calendar of accepted geological time. Under different circumstances widely different results are produced. In Hawaii, where the lava is very liquid, there are great volcanic cones rising to nearly 14,000 feet, with a base of seventy miles, and with a slope consequently of only six or eight degrees. Cotopaxi, which has been built up by continuous eruptions from the same vent, is 19,600 feet high; the height and width of the base increase together; and the vertical section is nearly that of an equilateral triangle. The great eruption in the Isle of Java in 1772 was the grandest and most terrific exhibition of the inner forces of the earth recorded in history. A cone 9,000 feet high broke out in eruption, an enormous mass of materials was ejected, and the mountain was reduced in height to 5,000 feet. These and similar eruptions are the violent but spasmodic efforts of volcanic force; but equally great or even greater results have probably been effected by the slow and continuous action of thermal springs, by which large quantities of heat must be constantly escaping from the interior of the earth, and materials removed and carried down to be ultimately redeposited at the bottom of the sea. It is calculated that the solid matter dissolved in the hot waters of Bath alone, which has by their agency been extracted from the earth during the last 2,000 years, would, if collected, form a solid cone equal to the bulk of Monte Nuovo.

The general proximity of active volcanoes to the shores of the sea has long been noticed; and recently extended observation confirms the fact, with only two considerable exceptions. For, in the centre of the vast tract of land formed by Europe and Asia—the largest unbroken one on the globe—there rise the volcanoes of the Thian Shan Range, of which, however, it is desirable that more should be known; and, on the contrary, the volcanoes of the Sandwich Islands, which are the largest in the world, rise almost in the centre of the widest ocean and from its greatest depths. But a careful study of the evidence leads to the conclusion that the proximity of the ocean to volcanic vents should be regarded not as the cause, but as the effect, of subterranean action, when regarded in its most universal aspect. Professor Judd describes mountain-chains as cicatrized wounds in the earth's crust, representing the lines of great fissures along which volcanic action has been manifested. Afterwards subsidence during long periods takes place, during which are being accumulated the future materials of the mountain-range; the effect of vast tension and pressure and of enormous heat transforms the deposited strata into hard and crystalline rocks; there is further elevation at successive epochs; and, finally, the action of water in torrents, or rain, or by frost, denudes the harder rocks and shapes out of them such masses as those of the Andes or the Alps. The time is, of course, to be counted by millions of years, and the vertical spaces to be filled in must be measured in thousands of feet; but there is nothing in the figures which need detract from the probabilities of this hypothesis. If it is accepted, it is likely that at any given time the weakest parts in the earth's crust will be along the lines of demarcation between the land and the sea, and it is here that active volcanoes would be found. To go back to an actual beginning is more than is now expected from science, which can only refer to a long series of similar changes, showing that volcanic action was at work among what are believed to be the oldest rocks. Continuous secular changes

following in similar cycles of phenomena appear to be the rule in inorganic as well as in organic existence when the former is surveyed in the large and comprehensive way necessary in dealing with the cosmical history of our globe. Earthquakes thus cease to be portentous, and take their place in the ranks of the ordinary ministers of nature; and, so viewed, they "break not heaven's design," as Pope has hypothetically said of them in his well-known comparison between the moral and physical evils of the world.

Much valuable illustration of modern volcanic eruptions and flows of lava is supplied by Professor Judd in the descriptions of the similar events which have occurred in the palæontological history of many a well-known region. The Island of Mull, in the Hebrides, is the wreck of an ancient volcano, which had a base of thirty miles, and a height of 10,000 to 12,000 feet, but which is now degraded to hills hardly exceeding 3,000 feet. Similar dimensions are conjecturally ascribed to the great volcano at work in Tertiary times in the Island of Skye, and the physiology of volcanoes may now be studied among the extinct remains in the great museum of nature around Loch Coruisk and along the Oolite Hills; just as comparative anatomy can be often learned better from the preserved specimens in our great collections than from the living animals themselves. Such generalizations as are furnished by these studies of the geological antiquities of our own planet may be supplemented and extended by referring to the present condition of the sun and moon, and by an examination of the smaller bodies which alight upon the earth in their swoop through space, proving to how great an extent we share with them the same elements, and that in the present of the sun we may see our own past, and in the moon, with its vapourless surface, and extinct craters of unearthly dimensions, our own possible future.

#### MAX MÜLLER'S SACRED BOOKS OF THE EAST. VOL. X. PART I.\*

PROFESSOR MAX MÜLLER has here reached the half-way volume of his original scheme, which seems to widen as the work proceeds. This volume consists of two canonical books on Buddhism, the originals of which are written in Pāli verse. The first, *Dhammapada*, is translated by Max Müller himself; the second, *Sutta-nipāta*, is translated into English by the celebrated Danish Pāli scholar, V. Fausbøll. Both translations, therefore, are from the most competent hands. This volume is likely to prove more generally acceptable than any of the previous volumes; partly from the great and growing interest which Buddhism has won to itself, and partly from the intrinsic merits of the works themselves. The exact place of the *Dhammapada* in Pāli canonical literature has yet to be determined, for there are different and authoritative classifications of the old Buddhist works. Those who accept the division of the *Tipitaka*, or "Three Baskets"—a division very generally received—include the *Dhammapada* among them; but, whatever its classification, there is no doubt as to its great authority and universal acceptance among Buddhists. Like most Oriental works of antiquity, its date is uncertain, but somewhere about the beginning of the Christian era is the probable time of its composition. One point is certain, that the celebrated Buddhaghosa at the beginning of the fifth century wrote commentaries in which he quotes and comments upon passages of this work. Professor Müller himself cannot "see any reason why we should not treat the verses of the *Dhammapada*, if not as the utterances of Buddha, at least as what were believed by the members of the council under Asoka in 242 B.C. to have been the utterances of the founder of their religion." The internal evidence of the work is indecisive, but its tone and spirit are well worthy of Buddha himself, and the whole or a part may have been delivered by him.

The word *Dhamma* is one of many meanings, and *pada* also, in a less degree, varies in its significations. The title *Dhammapada* has been translated as "Footsteps of Religion," "Paths of Religion," and Professor Müller prefers the rendering, "Path of Virtue" or "Footstep of the Law." The *Dhammapada* has already appeared before the European world in a Latin version by Dr. Fausbøll, published in 1855,

which will mark for ever an important epoch in the history of Pāli scholarship; and though later critics have been able to point out some mistakes, both in his text and in his translation, the value of their labours is not to be compared with that of the work accomplished single handed by that eminent Danish scholar.

Professor Beal has also translated a considerable portion of the same work from the Chinese version, but this has not proved so valuable as was expected. A considerable portion of the work has also been translated by Sir Coomara Swamy of Ceylon.

So excellent a version as that of Dr. Fausbøll having been before the world for nearly thirty years, it may be asked why another translation was necessary. When Dr. Fausbøll published his work Pāli learning was in its infancy. It has since had great and rapid growth, to which the appearance of Obilders's Pāli Dictionary has given a vigorous impulse. The plan of Professor Müller's series of *Sacred Books of the East* required an English version, and he is not the man to be contented with a translation from a translation, or to rest quiet while the learning of his particular

sphere of study has been advancing. He has made his predecessor's work the basis of his labours, and never ventures to differ from him without giving reasons and citing his authorities. There can therefore be no doubt that this translation approaches, if it does not absolutely reach, perfection, and that we are in possession of a full and accurate version of one of the earliest and most important of Buddhist works.

Whoever was the author of the *Dhammapada*, there can be no doubt that it embodies doctrines and teachings of the purest and most elevated character, which, if not promulgated by Buddha himself, must have been the composition of one of his most eminent disciples. In Dr. Fausbøll's edition the original text is printed, so also are the many extracts from Buddhaghosa's commentary which Fausbøll quoted to justify his translation. In the present volume we have only the translation, as Mr. Müller's work is devoted to translations only. The original is written in verse, in the ordinary *sloka* metre, and runs freely. It is divided into twenty-six short chapters, which contain, on the whole, four hundred and twenty-three verses. Some of the chapters are devoted to purely Buddhist doctrines, others give the Buddhist exposition of virtues and morals which are universal in their nature. Thus the second chapter is on Earnestness, and opens as follows:—

21. Earnestness is the path of immortality (Nirvāna), thoughtlessness the path of death. Those who are in earnest do not die, those who are thoughtless are as if dead already.

23. These wise people, meditative, steady, always possessed of strong powers, attain to Nirvāna, the highest happiness.

24. If an earnest person has roused himself, if he is not forgetful, if his deeds are pure, if he acts with consideration, if he restrains himself, and lives according to law, then his glory will increase.

The fourth chapter is on "Flowers," which are brought in to illustrate moral teachings:—

49. As the bee collects nectar and departs without injuring the flower, or its colour or scent, so let a sage dwell in his village.

51. Like a beautiful flower, full of colour and full of scent, are the fine but fruitless words of him who does not act accordingly.

52. But, like a beautiful flower, full of colour and full of scent, are the fine and fruitful words of him who acts accordingly.

In the chapter on "Punishment" men are exhorted to abstain from injuring each other, because others "are like unto them," and alike fear death and love life. And the concluding verses of the chapter inquire:—

143. Is there in this world any man so restrained by humility that he does not mind reproof, as a well-trained horse the whip.

144. Like a well-trained horse when touched by the whip, be ye active and lively, and by faith, by virtue, by energy, by meditation, by discernment of the law you will overcome this great pain (of reproof), perfect in knowledge and in behaviour, and never forgetful.

Professor Müller translates the word Buddha as the "Awakened," and says that it "is to be taken as an appellative rather than as the proper name of the Buddha. It means anybody who has arrived at a complete knowledge." Etymologically this is true; but it is certain that it is almost invariably used for Gotama, the Buddha himself. In support of his assertion Professor Müller appeals to the following verse, which is one of the most solemn of verses among the Buddhists:—

183. Not to commit any sin, to do good, and to purify one's mind, that is the teaching of (all) the Awakened.

We cannot see the necessity for the interpolation here of the word "all." The context does not require it, but is rather opposed to it, for it calls Buddha "the Omniscient"; and, although Mr. Müller says that the word is applied to "anybody who has arrived at a complete knowledge," it may well be doubted if "complete knowledge" is equivalent to that divine omniscience which Buddhists ascribe to Buddha. This reading is important in another sense, for, if the word Buddha here applies to the great founder of the religion, it becomes tolerably clear that the *Dhammapada* was not his own composition.

The treatise translated by Dr. Fausbøll, and forming the second part of this volume, is like the *Dhammapada* of great antiquity, but its date and its author are in like manner unknown. It is considerably longer than the *Dhammapada*, being divided into five *vanggas* or books, containing 55 chapters and occupying 214 pages. Dr. Fausbøll says:—

The Collection of Discourses *Sutta-nipāta* which I have here translated is very remarkable, as there can be no doubt that it contains some remnants of Primitive Buddhism. I consider the greater part of the *Mahāvagga* [Book III.] and nearly the whole of the *Atthakavagga* [Book V.] as very old. I have arrived at this conclusion from two reasons, first, from the language, and secondly, from the contents.

And he goes on to support his opinion as to the language by citing various words which come nearer to the old Vedic forms than to those of the Sanskrit of later date.

As to the contents of the work he says:—

In the contents of the *Sutta-nipāta* we have, I think, an important contribution to the right understanding of Primitive Buddhism, for we see here a picture, not of life in monasteries, but of the life of hermits in its first stage. We have before us not the systematizing of the later Buddhist Church, but the first germs of a system, the fundamental ideas of which come out with sufficient clearness. From the *Atthakavagga* especially it is evident where Buddha takes his stand in opposition to Philosophy.

In the days of Buddha, as Dr. Fausbøll conclusively proves, India had two large and distinguished religious sects, the Samanas and Brāhmanas. The Samanas were of four kinds, and among them there were current at the time of Buddha no less than sixty-three philosophical systems. The same order of things seems to have existed among the Brāhmanas, and in condemnation they are

\* The Sacred Books of the East. Edited by F. Max Müller. The *Dhammapada* and the *Sutta-nipāta*: Two Canonical Books of the Buddhists. The former translated from the Pāli by F. Max Müller, and the latter by V. Fausbøll.

called "friends of the hymns" [of the Veda], and that they worship and make offerings to the fire, proving a strong Brahmanical influence over them. Polemical contentions were rife among both classes, and Buddha, grieved and offended at these variances, contended with and overcame the professors of all the sects in succession. He then asserted and enforced his own doctrine that "no one is purified and saved by philosophy or virtuous works, and that sanctification can be attained only by going into the yoke with Buddha, by believing in him and in the Dhamma of the Saints," and, in short, by being what Buddha himself is.

Buddha is described in various ways in the Sutta-nipāta. "He is Visionary in the good sense of the word" who, finding misery in the philosophical systems, at length discovered inward peace, and enjoined upon all men the duty of immediately embracing the religious life. Secondly, he is an Ascetic, or Muni, who forsakes the world and wanders about houseless; he has no prejudices; he has shaken off philosophical views and enters into no disputes; he is neither pleased nor displeased with anything; he is indifferent to learning; he does not cling to good and evil, and has cut off all passion and all desire, being equable and unmoved under all circumstances. He is still and calm as deep water, and has reached peace; knowing that bliss consists in peace, he has gone to immortal peace, the unchangeable state of Nirvāna. All this he effected by the destruction of consciousness, which is brought about by the cessation of sensation and by being without breathing. According to the teaching of this book, Sin, subjectively, is "Desire in all its various forms," but more especially for individual existence, which is the cause of birth and death, the two great evils from which escape is to be sought. On the other hand, bliss is subjectively emancipation from desire by means of the peace that Buddha preaches; and objectively it is emancipation from body and matter, by which the body is left behind, so that it may not exist again. "As a flame, blown about by the violence of the wind, goes out, and cannot be reckoned (as existing), even so a Muni, delivered from name and body, disappears, and cannot be reckoned (as existing). For him who has disappeared, there is no form; that by which they say he is, exists for him no longer." Such is a brief summary of the teachings of the Sutta-nipāta. Its style and method may be judged by quoting the first verse of the Uraga-sutta, or Serpent chapter, from its drawing a general illustration from the snake's slough. "He who restrains his anger when it has arisen, as (they) by medicines (restrain) the poison of the snake spreading (in the body), that Bhikkhu (mendicant) leaves this and the further shore, as a snake (quits its) old worn-out skin."

A few words more on the vexed question of spelling. Professor Müller has hitherto strongly insisted that the Sanskrit originals of Pāli Buddhist terms should be used in English writings whenever it is necessary to employ, and not translate them. But Pāli scholars have carried the day against him. Some of the original Sanskrit terms have received such various alterations of form in the different countries over which Buddhism has spread that their identity is far from obvious. No superficial scholar, for instance, would recognize the Sanskrit *darsanam* in the Pāli *dāṭi*. To translate such words "back into Sanskrit might seem as affected, nay prove in certain cases as misleading, as if in speaking of priests and kings we were to speak of presbyters and cynings." Mr. Müller thus gracefully gives up the contention, but declares his intention of using the Sanskrit forms when he has to speak or write of Buddhism in general. This seems to be the right, as it certainly is a convenient, method; for many readers would, for instance, understand Nirvāna to whom Nibbāna would be puzzling; and there are very many other words of the same nature. It would be advantageous to readers, but perhaps too much to ask of authors of books like the present, that they should supply in brackets the original Sanskrit word whenever the Pāli term has so varied from its old Sanskrit form as to make its identification difficult.

#### ON LATMOS.\*

THIS is a novel of the decidedly sensational order, for which class of work, however, even the apparently overstocked market does not seem to have diminished the demand. Miss Aiken-Kortright has written several other books of the same style, and apparently there is still a sale for her productions. Idle people are many, and idle people love a volume printed in large type, with few pages and a spirited plot. We cannot say that we have found the plot really exciting ourselves; but it certainly pretends to that distinction, and it may serve as interesting between those hours of the afternoon when tea and visitors have departed and the dressing-bell has not yet rung. Horatia Ormsby has "wandered upon Latmos heights," and "tasted love and known despair"; let us hope that some of the readers of her story may also climb the steep sides of illusion and fancy—though not, it is to be hoped, to "know despair." Horatia Ormsby is the beautiful and sole heiress to "the decayed manor-house, unshaven lawns, and sterile lands," also to the "accumulated debts and mortgages," of Ormsby Manor. She is an imposing young woman, and, had she worn the coronet of a duchess for years, she could not have moved with a more majestic air, under the stately cedars; but she is not at all of an engaging or lovable nature, and

even suggests some doubts as to her good breeding by her rude manners to her friends and neighbours, and her excessive scorn of any but quite the pattern poor on her father's estate. So intolerant is this haughty damsel of every kind of vice that, although she frequently helped the sick and poor from her own slender purse, she never did so save when they were eminently respectable, while "to the man who had ever yielded, even temporarily, to the vice of intemperance, or to the frail woman who could not have served at Vesta's altar, she was severely just." So just, indeed, is she that she is not ashamed to turn the old lodge-keeper from the home of years for a single extra pint at Christmas, or to banish a young dependent, with a baby, to squalor and sin in a distant town, rather than give her out work from the Manor to keep her in honesty. Every reader of this tale will, we think, feel a certain kind of satisfaction when this proud and ruthless heiress of the calm temper herself falls a prey to the tyrant passion, and is forced, most justly, to submit in agonized silence to the taunts of the very woman whom she has condemned. For it must be said at once that this novel is not precisely of the homely and simple type of literature which the proverbial English mother is supposed to place without a misgiving in the hands of her innocent daughters. If not in strength and conciseness of plot, or in pithiness and brilliancy of dialogue, it has at least in the elements of sensationalism taken its cue from the typical French novel, and would, we fancy, fair rank with the publicly denounced and privately devoured works of fiction supposed to make up the stock of a foreign library. But somehow an improbable love intrigue, however forbidden be the fruit, an attempted description of *demi-monde* life, and even a good daring murder, do not suffice to produce a baneful book unless something of realistic force and individual passion be added thereto, and we would defy the most excitable novel-reading young miss, on the warmest and laziest summer's day, to derive the smallest possible amount of harm from the perusal of the experiences of Miss Horatia Ormsby. The intricate little tale is, however, full of complications. To save the ancestral domain from ruin and degradation, Horatia is, at the opening of the story, supposed to be about to listen to her incompetent old father's earnest persuasions, and bestow her hand upon a proud peer of the name of Lord Selmore. But, on its appearing—in an interview described with not the most perfect refinement—that the cold-featured lord has not really had any intention of bidding for the hand of Miss Ormsby until he guesses the old squire's wish by his too evident desire to open transactions, the young lady herself flouts the whole affair by asking her suitor if he mistakes her for a steed at Tattersall's, and sweeps out of the room with a good deal of dignity. This leaves the stage free for the entrance of Luigi Valerio, the beautiful, but illegitimate, son of an Englishman by an Italian peasant girl. This young gentleman comes to the village in the capacity of organist, and soon touches the heart of the heroine with his wonderful performances in the parish church, while at the same time he involuntarily engages the affections of Ellen Grantley, the *ingénue* of the book, during the course of twilight music lessons. Valerio himself is a good-natured fool, but he pays dearly for being possessed of such statuesque beauty and musical talent. Miss Ormsby marks him for her own. She soon disposes of poor Ellen—her friend and *protégée*—brutally scoffs at her foolish passion, and packs her off to London, where she quickly persuades the worsted Selmore into proposing to her in a misplaced fit of generosity by hinting that the girl's slighted passion was for himself. Nothing then remains but to ensnare Valerio, and a very few music lessons compass this end. What follows is really ingenious. Such a girl could not compromise herself by openly affecting a sentiment for one so far beneath her; but the old Manor has in a distant wing a suite of haunted rooms, and thither the apartments of the young lady are speedily removed; so that she is not only able to receive Valerio at tête-à-tête midnight interviews, but also, in case of accidents, to pass him off as the ancestral ghost of the ancient family history. This happy state of things does not, however, last long. Having surrendered her honour, but without intending to "plunge deeper into folly" by marrying the lowly object of her passion, Miss Ormsby wearies of music, and determines to put her lover's constancy to the proof by tasting the delights of a London season while he pines alone in the solitude of a country village. She gets more than she bargained for. One day, driving in the Row, a lady of the *demi-monde* is pointed out to her, and she sees with consternation her own Valerio exchanging cards at the Park railings with this dashing personage. True, he soon shifts his attention to gaze admiringly after herself, but he does not recognize her. Here is plainly a mystery, for we are presently introduced to the questionable damsel entertaining her admirers—among them the enigmatical Italian—at her house in Park Lane, and the supposed deceiver lectures Miss Lotty in a fashion inconsistent with a love intrigue, even drawing tears from her eyes for a moment. A mystery is not a new thing; but the visit of a lady of rank to a person of doubtful virtue, and her abject petition for secrecy, purchased with a diamond ring, are rather startling in their novelty. We ought to compliment Miss Aiken-Kortright upon her success in these days when the competition for new things is so severe. For there is no partiality shown to the great in this interview. As Miss Lotty kindly reminds her aristocratic visitor, they are both in the same boat, and poor Horatia leaves the house in Park Lane not only degraded but deceived. Her deception costs the Greek-headed music-master his life. The heiress returns to the haunted rooms in the old

\* On Latmos. By Fanny Aiken-Kortright. London: Remington & Co. 288s.

Manor, and, refusing to believe her lover's oath that he has never left the village, poisons him in a cup of wine. Fortunately she gets him out of the house before the drug takes effect, and he dies playing the organ, the strains of which are wafted to her upon the midnight breeze. A marriage with the proud peer so rudely spurned in the first chapters follows as a matter of course, since the *ingénue* has refused to be sold to him on the very morning of her wedding day; and no less inevitable is the reappearance of the facsimile Valerio—Luigi's twin brother—in whom the reader will recognize Miss Lotty's midnight mentor. This highly virtuous gentleman, bent on revenge, haunts the path of Horatia, Lady Selmore, in the manner of the Corsican twin. The lady of course is much discomposed by this apparition, but tries to hope that her drug did not actually kill the victim; anyhow, her fears and faintings finally arouse the suspicions of the upright husband, who, on being convinced of his wife's past dishonour, nobly expires of a broken heart with the portrait and the letters of his dead rival in his hand. It now only remains for the twin to disclose his identity to the tragic widow, and threaten to abandon her to justice unless she consents to turn the old Manor house into a home for fallen women. This she speedily proceeds to do, for she is overwhelmed with remorse that her crime was committed on an innocent man, and she even turns the wicked Lotty to contrition for a short, a very short, time. Not even the avenging brother's kind order of release, given in the sunshine of his own wedded morn, can break the proud spirit of Lady Selmore, who will not be beholden to any one, and prefers to await what she is pleased to call the miracle of her granite nature's repentance, near her victim's grave, rather than in the liberty of a foreign land. The tale closes on her in a high-necked gown and an unbecoming bonnet. The only relief to this gloomy recital is the love of the music-master's priggish brother for a homely English maiden, who does more than a mother's duty to her orphan brothers and sisters, though her dress is always "dowdy in the extreme." The portrait of this young lady, who rejoices in the name of Ithama, is a pretty sketch; but she can hold but a small place in a tale treating of so many and such varied types of character in so small a space. Miss Aiken-Kortright certainly has a talent for weaving a plot, although she does it somewhat in defiance of the probabilities of life; but the book belongs to a category which, if it has a large circulation among the general public, can scarcely hold a high place in the world of literature.

#### PUBLICATIONS OF THE ENGLISH DIALECT SOCIETY.\*

THE second part of the *Dictionary of English Plant Names* carries the compilers over the main portion of their task. The forthcoming part will complete a work which will preserve not a few words that are rapidly dying out. The changes which railways have brought with them are making havoc of the old talk of the people in the remotest parts of the country; and the usefulness of the English Dialect Society may be measured not many years hence by the memorials which they will have handed down of dialects in places where those dialects will be no longer known. The purpose of the editor is to assign to the popular names of plants their scientific equivalents rather than to go into much detail about the plants themselves; but some of the entries convey information which may have some interest for those who know little and care little for botany. Among the most curious of these entries is one on "Mother's Heart." At first sight there is nothing to attract us in the seemingly stupid game played with the seed pouch of the *Capsella bursa-pastoris* in the Eastern border district, where the children hold out the pouch to their companions asking them "to take a haud o' that." It immediately cracks, and then follows the shout, "You've broken your mother's heart." But our attention is roused when we learn that in Hanover, as well as in the Swiss canton of St. Gall, the same plant is offered to any one who will pluck off one of the pods, the comment on the act of plucking being, "You have stolen a purse of gold from your father and mother," and, secondly, that the game is found in a slightly different form in Venezuela, where the plant used is the common tropical weed *Ageratum conyzoides*, known popularly as "Romper angel." This name, according to Dr. Gorst, is explained by some as "rompes á tu abuelo" (you tear your grandfather), this being the exclamation when, of two children who take hold of the leaf, one by the lower, the other by the upper part, either of them pulls so hard as to tear the leaf. Are these two forms of the game in countries so distant to be traced to a common source, or is it after all only a case of borrowing or learning by one people from another? The question is one which can scarcely be settled without running on into a wider subject.

The general and inveterate habit of corrupting names is, as we might expect, abundantly illustrated in this Dictionary. Langde-beef, the popular name of the herb bugloss, is the *Langue de bœuf* of Central France, where, however, it designates not the same, but an allied plant. In Hertfordshire the name loses its meaning in its corrupted form *Langley Beef*. But in Kemps, the popular name for *Plantago lanceolata*, a genuine English word for warriors has been preserved, although it has died out of the written language. The ballad of "King Estmere" in Percy's *Reliques* speaks of the

King of Spayne as coming forth "with Kempis many one"; and the plants are still used by children in Scotland in the common game of behending warriors—that is, of decapitating the head of a plant by means of another held in the opponent's hand. In "neesewort" or "neesing root," the name of *Veratrum album*, as making people sneeze, we have an intermediate form between Nase (Ness), and Nose. The Jerusalem artichoke has its place in the Dictionary; but nothing is said of the origin of the word, and the reader is left to learn elsewhere that it is an instance of corruption much more singular than that which converted "langue de bœuf" into *Langley Beef*. The list of plants whose names are compounded with the word *horse* is, of course, a long one; but here too it might have been pointed out that the first part of the name is used in different senses. The Horsebane is necessarily that which kills the horse; but the horse does not eat all the plants which bear his name. The Horsetail and the Horsetongue are so called from a supposed likeness to the tail and the tongue of the horse; but the Horse-thistle, the Horse-sorrel, and many more are, we can scarcely doubt, so named by the same process which gave the Greeks a Bou-pais or a Boukephalos. The *Horse-plum*, however, known also as the Horse-jug, Horse-jags, is said to be a small red plum, although the Horse-gogs denote a large wild plum yellow in colour and late in ripening. But, in truth, the popular names of plants generally are to be interpreted cautiously. Some which have an ancient look are quite modern, as Timothy Grass, which bears the name of Mr. Timothy Hanson, who brought the seeds of it to Carolina; others are old Teutonic words, sometimes oddly misunderstood, as the holly, which Mr. Skeat traces to a root reappearing in the Latin *culmen* and *culmus*, but which Theis, in his Botanical Glossary, explains in the following wonderful fashion:—"Holly, saint, sacré; à cause de sa verdure perpétuelle, regardée comme un don de ciel."

Mr. Britten's volume on *Old Country and Farming Words* may be regarded as supplementary to his *Dictionary of Plant Names*. While at work for the latter, he was led to consult Ellis's *Modern Husbandman* as a possible storehouse of plant names. In this search he came across many other words which seemed unusual, and which Ellis stated to be of local use. The collection of these words suggested the overhauling of some other agricultural works of the last century; and the result is the present volume, which is enriched by many valuable comments from Mr. Skeat. There is little doubt that Mr. Skeat's favourable opinion will be borne out by those who may take up the book, although the list of entries is by no means confined to unusual words. The use of *bavin* in the sense of "a bundle of brushwood" is not peculiar to the county in which Ellis lived. We have the hazel *bavin*, as furnishing a seat, mentioned in *Hudibras*. The peculiarity would be rather in the modern usage of builders, who denote by it thin lathes, not rough wood. But, on the whole, the several lists given in this volume show that the books from which they have been drawn up were well worth the trouble taken in examining them. These works are the *Modern Husbandman*, and other writings of William Ellis; the *Observations on Husbandry*, by Edward Lisle; the *Dictionary Rusticum* of J. Worlidge; the *Annals of Agriculture*, compiled by the well-known Arthur Young, and the *Reports of the Agricultural Survey*. Mr. Britten gives a further list of Agricultural Provincialisms and of Weights and Measures from Morton's *Cyclopædia of Agriculture*. Ellis, whose works are taken first in order, was a most prolific writer; in plain English, he wrote a great deal too much. His *Husbandry* passed through five editions; but both this work and his other writings seem to have been utterly forgotten. The fact is perhaps explained by the opinion of the writer of the short memoir prefixed to the abridged edition of 1772, that Ellis "engaged for larger quantities of MS. than his materials of real excellence would allow," and that thus "all his pieces are nearly equal in being filled with trash," the consequence being that "he no longer found any pecuniary advantage in writing." He showed his sound sense by giving up his scribbling and sticking to his farm, with the determination of depending upon it alone. It would seem that, even in the padding of his books, he had an eye to the main chance. He "made a traffick of ploughs, horsebreaks, &c.," and this "induced him to be very voluminous in their description and very hyperbolic in their praise." In short, his books were advertisements. Of his personal life little is known; but he lived for half a century at Little Gadsden, in Hertfordshire, where probably he was born. Edward Lisle was a landowner in Wiltshire and the Isle of Wight, but towards the end of the seventeenth century he settled himself at Orux Easton, in Hampshire, and there carried on with enthusiastic zeal the work of farming, to which he devoted his life. "His constant method," his son tells us, "was to note down the opinions and advices he thought might be useful to him, and afterwards to add occasional remarks on them from his own experience." But he formed no plans of publishing the results of his research for many years later; and his *Observations on Husbandry* were not given to the world till after his death in 1722. Of John Worlidge or Woodbridge little more is known than that he lived at Petersfield in Hampshire; that he wrote several treatises on agriculture, bees, and gardening; and that he took a scientific view of farming, which placed him beyond his contemporaries. His chief work, the *Systema Agriculturae*, was published in 1669. Arthur Young, the compiler and publisher of the *Annals of Agriculture*, needs no notice; but his name failed to win much success for the ponderous volumes, forty-six in number, of which this series consists. Mr. Britten adds that the number of words ob-

\* A Dictionary of English Plant Names. By James Britten, F.L.S., and Robert Holland. Part II.

Old Country and Farming Words. By James Britten, F.L.S. London: Published for the English Dialect Society, Trübner & Co. 1880.

tained from them scarcely compensates the toil of the research, although there are among them some of interest. From them we learn that the old *fang*, to take, survives in the phrase *vang in*, which denotes the taking in of stock in contrast with breeding it. From Worlidge we have the words *neaving* and *nape*, in both of which Mr. Skeat asserts that the same process of coition between the final consonant of the preceding word and the initial vowel of the word itself has taken place, *neaving*, yeast or harm, being the result produced from "an heaving," and *nape*, denoting "bulphinch," being obtained from "an alp." Close to these words we have the entry *neat*, of which the only explanation given is that it means "a heifer, or any of the kind of beves." To those who are not aware of it, it might be interesting to know that *neat* is a compound word, answering exactly to the Greek *Alogon*, although the latter is confined to horses and the former to cattle.

Here and there an explanation seems to throw little light on the matter explained. In Hertfordshire we are told that "declining husbandmen" are called "afternoon farmers"; and under *declining* we read that the word means *backward*. It would seem, then, that farmers who are behindhand with their work are looked upon as men who spend their mornings in sleep and get up after midday; but it is not so easy to see why such men should be called declining, unless indeed it be because the sun is going down when they are getting up. Leaving this obscure question, we may notice that the Hertfordshire form for *fitches* or *vetches* is *thatches*. This Mr. Skeat rightly considers important, "as showing *th=ph* and corroborating *jill-horse = thill-horse*." In the word *beves* as used among the English peasantry we have a form intermediate between the Latin *bibere* and the French *boire*. Of this there can be no doubt, although the accounts given of the meal so called refer only to the solid and not to the liquid food consumed. By Hertfordshire usage it seems to have been an afternoon meal of bread and cheese; but in Essex it was, we are told, the first meal taken by horsekeepers after beginning work. The entry *beves* might lead us to expect a word of equal interest; but it is scarcely so. Lisle speaks of a friend as telling him that "a cow-calf would make very pretty beef at three years old, but, if killed sooner, they called it *beves*." This Mr. Skeat interprets as "probably *beef-ish*—i.e. beeflike—not quite beef, but like it." Some country expressions give variant forms of French words. Thus *suant*, which has been referred to the French *suivant*, is the old French *suant*, which occurs in the English *pursuant*. The Middle English of *Piers Plowman* has *sewynge*. In *Stafford* we have, Mr. Skeat thinks, only a rustic mistake for *Scenfold*, "a fine English word of French origin. The rustic naturally substituted the *st* of his familiar *steddle* or *staddle*, as in *bedstead*, *bedsteddle*." *Heelrakes*, which for some mysterious reason are said to be so called from the great quantity of work which they get through in a short time, Mr. Skeat regards as a product of false etymology, the word occurring as *heelrake* (*heelrake*). Of the verb *team*, which is, we are told, in the North of England, "to unload carts," a team being an empty cart (Scottish *toom*, empty), Mr. Skeat's comment is, "Some mistake; we all know a *team* is not an empty cart. The word *team*, better *teem*, to empty, is formed from *toom* by vowel change, like *feed*, verb, from *food*, sb., or *meet*, verb, from *moot*, sb., an assembly. A *team* is quite a different matter."

The reader who consults these lists may be tempted to regret that Mr. Skeat's comments and suggestions are not more numerous. But Mr. Britten urges with justice that the purpose of the English Dialect Society is rather to collect than to elaborate, and that he has regarded his own task as sufficiently done when he had compared the words in his authorities with Halliwell and such other works as happened to be under his hand at the time, adding references where these seemed to be desirable. The value of his work will be more fully seen some years hence.

#### FRENCH LITERATURE.

THE Letters of Mme. de Rémusat (1) may suffer a little from comparison with the brilliant and historically important memoirs which preceded them. But their want of interest is only comparative. Written as they were for the most part to her husband during his enforced absences with the Emperor, much of them is taken up with matters extremely interesting to the writer, but of perhaps less lively attraction to the readers for whom they were not intended. About public affairs there is not much, and indeed, under Napoleon's Government, it was by no means safe to write freely on any such subject. Some private friends who are of interest, such as Morellet, Mme. d'Houdetot, Talleyrand, appear once more, and there are occasionally amusing details as to Mme. de Rémusat's troubles with the actors. In his capacity of Chamberlain, M. de Rémusat was responsible for the supervision and management of His Majesty's servants, and this responsibility continued even when he was absent. His deputies were not over efficient, and Mme. de Rémusat constantly had to pacify offended genius by feminine arts. Perhaps, however, the most really interesting thing in the book is its display of the affectionate, vivacious, acute, but somewhat hasty, nature of the writer. Mme. de Rémusat never cooled in her affection for her husband, and theoretically acquiesced in the doctrine in which husbands find it hard to make wives believe—that in absence business makes correspondence difficult. Every now and then there are

the oddest little outbursts of wounded feeling, because a letter has not come or has been cold in style, outbursts which are almost invariably followed by penitential apologies. Altogether, the book, if it does not add very much to actual historical knowledge, adds agreeably to the literature of biography.

M. Beljame's book (2) is one which, but a short time ago, would, as coming from a Frenchman, have been greeted as something of a prodigy. The only characteristically Gallic trait is that the author, instead of writing (as he is obviously well qualified to do) a history of English literature from Dryden to Pope, has written, nominally at least, an essay on the relations of the public to men of letters, illustrated by the lives and works of Dryden, Pope, and Addison. The book shows a most remarkable acquaintance not merely with the great authors of the period, but with the whole range of lighter English literature at the time. M. Beljame's apparatus of footnotes, citations, bibliographical tables, &c., is very extensive, and he is singularly accurate. No one, indeed, save those who have had occasion to make a minute examination of the same subjects can fairly appreciate his erudition, which in a foreigner is most remarkable, or his critical faculty, which, where he exercises it independently, is worthy of not less attention. After all that has been written about Collier's onslaught on the theatre M. Beljame is well worth reading upon it, and he has displayed more impartiality than any of his English predecessors. Where he is weakest, and where he might be expected to be weakest, is in what may be called secondhand criticism—that is to say, in accepting and valuing the opinions and statements of different English critics and historians. But his work is for the most part so thoroughly verified by reference to the originals that this is of but little importance.

A good study of Dupleix has long been wanted, and M. Tibulle Hamont (3) goes far to supply that want. He seems to have been put on the track by Colonel Malleon. But he has given himself a great deal of trouble to discover and search the unprinted correspondence of his hero, and the result is a piece of work sufficiently solid and decidedly interesting. That M. Hamont should be somewhat disposed to overvalue Dupleix is natural. To say that the English conquest and administration of India proceeded on lines which were a "servile copy" of those of Dupleix is rather more than pardonable extravagance. However, the treatment in the text is a good deal more sober than might be expected from this little firework in the preface. The remarkable capacity of Dupleix has never been denied, nor is it deniable that he was very badly seconded by his military lieutenants and treated by the home Government very nearly as Hannibal was treated by the Carthaginian Senate. Considering, however, how entirely the odds were in his favour for a long time, and how completely he lost the game, it is pretty obvious that there must have been some deficiency in his play. His generals were far inferior to Olive and Lawrence (to whose genius, especially that of the latter, M. Hamont does full justice); but perhaps some readers of this book will be of opinion that the suggestions, encouragements, reassurances, &c., of which Dupleix was so prodigal to them were likely to do more harm than good. It is also clear from this book that, selfish and inhuman as our Government in India too often was in its early days, that of the French was conducted on far worse principles. The breaking of the dikes of the Cauvery, "afin de frapper l'imagination des Indiens et de leur montrer que comme un Dieu il dispose des éléments pour frapper ses ennemis," is one of the blackest acts even in French history. M. Hamont, we think, is unfair to La Bourdonnais. However, these are controversial matters. If M. Hamont's book brings out Dupleix's faults, it also brings out fully, and almost for the first time, his abilities, and duly exposes the ingratitude with which he was treated. Even here, perhaps, the Devil's advocate may have something to say; for, after all, Dupleix had played double or quits with the French possessions in India, and had lost.

The principal characteristic of M. Benlœw's essay on the philosophy of history (4) may be said to be the freedom and independence of his generalizations. All history is divided into the cycle of the ideal of beauty (Greece, &c.), the cycle of the ideal of goodness (Christian period up to the Renaissance), the cycle of the ideal of truth (modern times). The neatest tabular demonstrations, the most agreeable corroborating disquisitions, accompany the unfolding of this attractive sketch. There is really a good deal of learning and some ingenuity in *Les lois de l'histoire*, but it is to be hoped that no one will read it who is not already well acquainted with the facts.

*La Papauté au moyen-âge* (5) is an essay of a much more solid kind, consisting of four studies on Nicholas I., Gregory VII., Innocent III., and Boniface VIII. It is perhaps one of those books which are rather creditable to the writer than profitable to the reader, yet to the intelligent reader it is likely to be not wholly destitute of profit.

M. Perroud's monograph (6) is of a different, and as we venture to think a much superior, kind to both of these. It is a definite attempt to settle a definite point which requires settling—in this case the date and circumstances of the constitution

(2) *Le public et les hommes de lettres en Angleterre (1660-1744)*. Par A. Beljame. Paris: Hachette et Cie.

(3) *Dupleix*. Par Tibulle Hamont. Paris: Plon.

(4) *Les lois de l'histoire*. Par L. Benlœw. Paris: Germer-Baillière.

(5) *La Papauté au moyen-âge*. Par F. Rocquain. Paris: Didier.

(6) *Les origines de l'Aquitaine*. Par Cl. Perroud. Paris: Hachette et Cie.

of the first independent duchy of Aquitaine. The problem is a curious one, and the facts available are but few. M. Perroud, however, makes the most of them, and fills up the gaps, not with mere theorizing, but with inference, which is on the whole probable and legitimate enough.

The sixth volume of the *Grande-écrivains* edition of Molière (7), which is now in the hands of M. Paul Mesnard, contains *Le Médecin malgré lui*, *Mélicerte*, the *Pastorale Comique*, *Le Sicilien*, *Amphitryon*, and *Georges Dandin*. The notices and other critical apparatus are as solid and complete as usual.

The *Bibliothèque utile* has been increased by two useful little treatises (8), one on the Anthropoid apes, the other on newspapers. The title *Le Journal* would be a little more correctly written *Le Journal Français*, but this is natural enough, and M. Hatia has not been altogether exclusive in his treatment.

Criticisms on exhibitions have, after the exhibition is over, always something of the flavour of an old almanac. M. Maurice du Seigneur's "salon" (9) is, however, a good one, and it has for preface a really interesting sketch of the chief works in this curious department of literature in France in times past.

Mme. Clémence Royer (10) is, we fear, hardly to be called a "philosophess" of the highest class. Her book on ethics contains, so far as we have been able to discover, little but commonplaces clothed in the quasi-scientific jargon which is nowhere more repulsive than in French. The language of Condillac and Malebranche surely is not in need of the clumsy neologisms of a certain school of modern thought. Perhaps it should be mentioned that Mme. Clémence Royer is by her own account an anticipator of Mr. Herbert Spencer (*mon émule*, she calls him), one of the anticipators who by evil fortune cannot get their works out first.

M. Lockroy has thought to serve his political party by printing (11) some journals of a Jacobin ancestress of his written during the Revolution. He seems to think that this journal will help to whitewash a "parti odieusement et systématiquement calomnié." The result of reading it is, that we find a mother writing to her son (a boy of fourteen) "Nos courageux représentants après avoir bravé les foudres du despotisme," and much other windy rubbish of the same kind, and describing the unspeakable September massacres as "a miraculous salvation of Providence." To do Mme. — justice, she seems to have had some qualms about the means which Providence chose; but, as she philosophically remarks or quotes, "Quand on veut la fin, il faut vouloir les moyens."

*Les ports de la Grande-Bretagne* (12) is a very careful sketch of Glasgow, Newcastle, Liverpool, and London, in separate articles, and of the remaining ports of England and Scotland grouped together. These capital papers, of considerable literary merit, and full of facts not always known to Englishmen themselves, are reprinted from the *Nouvelle Revue*.

A slight, but readable, account of a journey through Spain to Algeria (13) adds one more to the long list of recent books by Frenchmen on their North African colony.

M. Emile Zola reprints his criticisms with energy and perseverance. This volume (14) contains articles on Balzac, Stendhal, Flaubert, the two De Goncourts, and M. A. Daudet, besides the general article on "Les romanciers contemporains" which not long ago provoked so many of his *confrères*. We need not repeat the opinion we have often expressed of M. Zola's criticism. With occasional vigorous and acute *aperçus*, it is, on the whole, tedious, destitute of appreciation, and wearisomely subordinated to the general purpose of proving that all good novelists were but schoolmasters to lead men to Zolaism. Its impertinent personalities are probably more annoying to the victims than they are amusing to the reader. There is, however, one paper, consisting of elaborate personal reminiscences of Flaubert, which is of the highest interest. It shows (what no capable critic acquainted with the works of the author has ever doubted) that Flaubert was nothing so little as a naturalist. His standards, his methods, his models were all romantic; and to this, beyond all question, is due the excellence of his work.

We must notice the 89th livraison (15) of the *Dictionnaire de pédagogie* in order to point out a most admirable short article on Shakespeare by M. Paul Stapfer, whose more extended Shakspearian work, as well as his essays on other subjects, have more than once been noticed in these columns. The article in question is so good a summary of the subject in a small space that we should be rather puzzled to find its equal, all things considered, in English.

Some pleasant verse comedies and verses, intended for recitation, have been published (16) by M. Pailleron in M. Calmann-Lévy's

pretty format of square 16mo. Perhaps the best thing in the book is the vigorous anti-naturalist preface eulogising the old standards, the old masters, the old tongue:—

Qui ne suffit pas à Riconard  
Et suffisait à La Bruyère.

M. Sarcey's notice of Mlle. Roussel (17), which is illustrated by an *eau-forte* by M. Lalanze, is as amusing in its way and as full of vulgarity and bad taste as M. Sarcey's notices of this kind are too apt to be. It opens with a pleasingly characteristic sentence:—"Où était en 1861, il y a donc vingt ans dès cela; je venais de débiter dans la critique dramatique. Je n'étais pas encore bien connu; mais pour les élèves qui sortent du Conservatoire tout homme qui met son nom au bas d'un papier noir est un personnage."

The last volume (18) of the Library Edition of the works of the late Joseph Autran contains the posthumous and, we believe, hitherto unpublished *Comédie de l'histoire*. It is a curiously unconscious testimony to the triumphant influence of M. Victor Hugo. Autran was never regarded as in any way a Hugonien; on the contrary, he was a decided Lamartinist. Yet not merely the title, but the plan and style, of this book are almost copies of the *Légende des siècles*. We cannot say that the result is very happy. Autran was a poet in his way, and what there was of limp in his versification has been corrected by the study of his great brother Academician. But the style of most of these pieces does not suit him, and he neglects the first duty of the satirist, the duty of being accurate. "Le Médaillon," for instance, gives the famous incident of Voltaire's asking for a locket from Mme. du Châtelet's neck after her death and finding his own portrait replaced by St. Lambert's. This little piece swarms with blunders. It is absurd to say that Voltaire "dominait le siècle," at this time. St. Lambert had not "translated Thompson in bad verse," nor did the *Smisons* appear for nearly twenty years after. Voltaire certainly did not say, "J'ai besoin d'achever mon acte de Tancred," inasmuch as *Tancred* was not then thought of. This is not the way that great satirists go to work.

The republication of M. Victor de Laprade's *Poèmes évangéliques* (19) may excite a taste for sacred poetry in France, but with all respect for his classic style and really admirable attention to form, we venture to doubt it.

M. Paul Déroulède's *Marches et sonneries* (20) have come from France with a great rumour of popularity. The reading of them is rather disappointing. Their success can only be attributed to the fit of what some Englishmen are pleased to call in other Englishmen jingoism which now has hold on France. We hardly think that M. Déroulède is the Rouget de Lisle of the Third Republic. There is a generous fervour, indeed, about him, and he occasionally hits off a vigorous line. But, on the whole, his book is more declamatory and more often actually prosaic than we could have expected from the author of *La Moubile*.

France has some admirable writers of children's books, from the venerable M. Sandeau downwards, and among these M. P. J. Stahl has a prominent place. *Les quatre peurs de notre général* (21), stories told by an Algerian commander to his staff over the camp-fire, are very pleasant moral tales, with the moral wrapped up in the very deffest fashion. We like the first two the best. In one of them a little child forces himself to readjust over a dead man's face the cloth which he has unwittingly disturbed, and in the other he overcomes his fear of cold water. Both are charmingly told. The third is improbable, and a little "goody"; the fourth somewhat out of keeping. But these faults are only comparative, and there are pleasant things in both stories. If we remember rightly, in her last book Mme. Henry Gréville busied herself in showing the sordid parsimony and hardness of heart of the French peasant. She has now (22) devoted herself to studying the corresponding virtues of the French bourgeois, so that her country ought to be very much obliged to her. Adeline Pichot, a young woman of great beauty and angelic appearance, is perhaps as disagreeable a heroine as can well be imagined. Unfortunately, there is a lack of the power which is needed in treating such subjects. Adeline is a heroine of Balzac's treated in the manner of M. Octave Feuillet. This, in Biblical language, is confusion.

In *La bataille de Laon* (23) M. Alfred Assollant exposes himself, as far as subject goes, to the charge of poaching on the manors of MM. Erckmann-Chatrian. There is, however, room for plenty of writers in the last wars of the Empire. M. Assollant writes with less knowledge of the ground and the people than his predecessors, and perhaps with less narrative skill, but with a far stronger and more nervous style. It is only a pity that his book is written in a spirit which makes it one long attack on Germany and the Germans. It cannot be said that this is irrelevant to the subject; but it suggests, and is clearly meant to suggest, as bad a compliment to the companions and contemporaries of Moltke as to the companions and contemporaries of Blücher. M. Albéric

(16) *Le théâtre chez Molière*. Par E. Pailleron. Paris: Calmann-Lévy.

Second's *La vie facile* (24) is a lively enough description of what has been described often enough before, the life of the more frivolous and unworthy part of French society. It is readable, the characters are well drawn, and there is nothing preposterous or revolting about it. *L'Odyssée d'une comédienne* (25) is a book which takes us back many years to the "cape and sword" novel of our youth. It is not at all a bad specimen of its kind, a kind that might be revived with advantage. The scene is laid at Darmstadt at the beginning of the last century. Lastly, has to be mentioned a collection of tales (26) of various merit. As, however, MM. A. Daudet, Theuriet, Malot, besides other well-known names, are on the list of contributors, it is not surprising that it should contain some capital pieces.

(24) *La vie facile*. Par A. Second. Paris: Dentu.

(25) *L'Odyssée d'une comédienne*. Par A. Lepage. Paris: Charpentier.

(26) *Chacun sa science*. Paris: Dentu.

## NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

## THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,345, AUGUST 6, 1881:

Afghanistan. The Land Bill. European Combinations.  
England and America. Lord Sherbrooke on Bankruptcy Law. The Transvaal.  
Egypt. Competitive Examinations. The French Elections.  
The Liverpool Penitentiary.

Cosmic Emotion. Dr. Plumptre on Modern Secularism.  
Northampton's Pride. George Borrow. The Abolition of Fog.  
Steam-Yacht Matches. Mr. Gladstone's New Plan for the Redemption of Debt.  
The Theatre. Miscellaneous Racing.

Les Quatre Vents de l'Esprit.  
Coral Islands. My Sister the Actress.  
Ward and Look. A Psychological Dictionary of the English Language.  
Volcanoes. Max Müller's Sacred Books of the East.—Vol. X. Part I.  
On Latmos. Publications of the English Dialect Society.  
French Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

## ADVERTISEMENTS.

**DORÉ'S GREAT WORKS,—"CHRIST LEAVING THE PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH,"** each 35 by 25 feet; with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DORE GALLERY, 35 New Bond Street. Daily, Ten to Six. 1s.

**NEW ETCHING.—THE DEFENCE OF RORKE'S DRIFT,** by the celebrated Etcher, L. FLAMENGO, after the picture by DE NEUVILLE. The Artist's proofs, price 10 guineas, are now ready for delivery; but few remain unsold. The Fine Art Society, 149 New Bond Street.

**ST. BARTHOLOMEW'S HOSPITAL AND COLLEGE.** OPEN SCHOLARSHIPS IN SCIENCE.

TWO SCHOLARSHIPS of the value of £150 each, tenable for one year, will be competed for on September 15th, and the three succeeding days. One of the value of £150 will be awarded to the best candidate at this Examination, under twenty years of age, if of sufficient merit. For the other, candidates must be under 25 years of age.

The subjects of Examination are Physics, Chemistry, Botany, and Zoology. The Jefferson Exhibition will be competed for at the same time. The subjects of examination are Latin, Mathematics, and any two of the three following languages, Greek, French, German. This is an open Exhibition of the value of £200.

Candidates must not have entered to the Medical or Surgical Practice of any Metropolitan Medical School.

The successful candidates will be required to enter at St. Bartholomew's Hospital in the October succeeding the examination.

**THE LONDON HOSPITAL AND MEDICAL COLLEGE.** Mile-end, E.—The SESSION 1881-82 will Commence on Saturday, October 1, 1881. FOUR ENTRANCE SCHOLARSHIPS, value £20, £40, £20, and £20, will be offered for competition at the end of September to new Students. Entries on or before September 30. Fees for Lectures and Hospital Practice, 50 guineas in one payment, or 100 guineas in three instalments. All Resident and other Hospital Appointments are free. The Resident Appointments consist of Five House-Physicians, Four House-Surgeons, and One Accoucheurship; Two Dressers and Two Maternity Pupils also reside in the Hospital. Special entries may be made for Medical and Surgical practice. The London Hospital is now in direct communication by rail and tram with all parts of the Metropolis.

MUNRO SCOTT, Warden.

**UNIVERSITY COLLEGE, LONDON.**

The SESSION of the FACULTY of MEDICINE will begin on October 3.

The SESSION of the FACULTIES of ARTS and LAWS, and of SCIENCE, will begin on October 4.

Instruction is provided for Women in all subjects taught in the Faculties of Arts and Laws and of Science.

Prospectuses, and Copies of the Regulations relating to the Entrance and other Exhibitions, Scholarships, &c. (value about £3,000), may be obtained from the College, Gower Street, W.C.

The Examinations for the Entrance Exhibitions will be held on September 28 and 29.

The SCHOOL for BOYS will RE-OPEN on September 27.

The College is close to the Gower Street Station of the Metropolitan Railway.

TALFOURD ELY, M.A., Secretary.

**BRIGHTON COLLEGE.**

Principal—Rev. T. HAYES BLOCHER, M.A., Queen's College, Oxford.

Vice-Principal—Rev. J. NEWTON, M.A., St. John's College, Cambridge.

The NEXT TERM will commence on Tuesday, September 20.

F. W. MADDEN, M.R.A.S., Secretary.

**BATH COLLEGE, BATH.**—The Next Term will commence

on Saturday, September 17, 1881. Head-Master—T. W. DUNN, Esq., M.A., late Fellow and Assistant-Tutor, St. Peter's College, and for ten years a Master of Clifton College.

**OXFORD MILITARY COLLEGE SCHOLARSHIPS.**—SIX SCHOLARSHIPS, Two of £75 a year, Two of £50, and Two of £25, will be offered for Competition on September 6 and 7. Names to be sent before September 1 to the HEAD-MASTER, Military College, Oxford, from whom particulars may be obtained.

**MALVERN COLLEGE.**

The NEXT TERM commences Tuesday, September 27.

For particulars, apply to HENRY ALDRICH, Esq., Secretary.

**S. ANDREW'S COLLEGE, CHARDSTOCK, Dorset.**

RE-OPENS September 16. Preparation for Universities and Public Schools. Moderate and inclusive fees.—Apply to SECRETARY.

**ISLE of WIGHT PROPRIETARY COLLEGE, APLEY**

(near RYDE).

The WINTER TERM will commence on Friday, September 16.

Full particulars from the Rev. Canon TERSDALE, Head-Master; or the SECRETARY, The Cottage, Melville Street, Ryde.

**WELLS CATHEDRAL GRAMMAR SCHOOL.**

Governers—The DEAN and CHAPTER of WELLS. Inclusive Fees (Board and Tuition), 50 Guineas a year. Preparatory Department for young Boys, 45 Guineas. The Cathedral Wells is peculiarly suited to delicate Boys. Next Term will begin September 1. For particulars apply to G. F. ADHAM, Esq., B.A., Head-Master, Cathedral Green, Wells, Somerset.

**ST. EDMUND'S COLLEGE, SALISBURY.**—A HIGH-

CLASS SCHOOL for SONS of GENTLEMEN. The religious training is upon definite Church principles. Boys are Educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, £75 a year.—For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOURNE, D.C.L.

**ABINGDON SCHOOL.**—This Foundation (A.D. 1563), Six

Miles from Oxford, has complete new buildings in large grounds. Classical and Modern Departments, with strong staff of Masters, valuable University Scholarships. Thorough preparation for the Military and other Professional Examinations, and careful grounding for Boys whose destination is the larger Public Schools. Well-ventilated Private Studies and Infirmary, Five-courts, rowing for Boys who swim.

School Fees, £57 to £83; advantages to the Sons of the Clergy.

Apply to the Rev. E. SUMMERS, B.D., Head-Master.

**TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.**

The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially prepared for Eton and other Public Schools. Careful preparation for the Military and other Professional Examinations. Exhibition to the Universities of £50 per annum. Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Terms 50 and 60 Guineas.—Apply to the WARDEN.

**SOUTH KENSINGTON PREPARATORY SCHOOL,**

25 Hereford Square, Gloucester Road, S.W.—The SONS of NOBLEMEN and GENTLEMEN are thoroughly prepared for Eton and other Public Schools. Careful individual attention. Special care of young Boys just leaving home. Experienced Governors for young Pupils. Head-Master—A. S. B. SCOTT.

**PREPARATORY SCHOOL, AMESBURY HOUSE, Page**

Heath, BICKLEY, Kent.—Rev. EDMUND FOWLE receives THIRTY-THREE

BOYS under the age of fifteen, to prepare for the Public Schools.

The house, surrounded by six acres of land, is situated in a charming locality, thirteen miles from London.

There is every requirement for a high-class Private School, a cricket and football ground, large iron playground, forming gymnasium, &c., two Eton five-courts, workshop, dry playground, and a run of a third of a mile on a dry gravel path.

The soil is gravel, and all the Sanitary arrangements in and out of the house have been under the special supervision of Dr. ALFRED CARPENTER, of Croydon.

Every Educational advantage given and many comforts offered, the greatest care being taken of little Boys on their first leaving home.

Great success has been met with, several open Scholarships gained, and in no single case has a Boy failed to take his proper place at a public school.

Rev. EDMUND FOWLE is well known by his very successful series of Latin and School Books, and for his Eton Greek Reader, written by special request for that School, and now in use at Eton, Harrow, Merchant Taylors', &c. Terms, from 50 to 120 guineas.

Address, till further notice, Bailyards, Armagh.

**OVERSLADE PREPARATORY SCHOOL (near RUGBY).**

The Rev. G. F. WRIGHT, M.A., late Fellow of C.C.C. Camb., formerly Assistant-Master at Eton School, and Wellington College, prepares BOYS from Eight years of age for the Classical or Modern sides of Public Schools.

**HIGHGATE SCHOOL.**—The Next Term commences Tuesday,

September 20. In the Indian Civil Service Examination of this year a Pupil passed direct from the School 17th out of 31 successful Candidates, and was first for Greek and first for Latin of all the Candidates.—For particulars of admission, apply to the Rev. C. McDOWALL, School House, Highgate, N.

**MILITARY AND CIVIL SERVICE EXAMINATIONS.**

There is a Department in connexion with BLAIR LODGE SCHOOL, POLMONT STATION, Strathguthrie, for preparation for the above Examinations. Honours gained during the past year. Three Appointments to Woolwich Academy. Seventh Place for Indian Civil Service, &c. &c.—Full particulars on application to the HEAD-MASTER.

**FINDEN PARSONAGE, WORTHING, Sussex.**—The Rev.

W. D. ALLEN, M.A., Vicar of Finden; Fellow and, from 1873-1881, Tutor of Magdalen College, Oxford; old Rugbyman, has Vacancies for HOUSE PUPILS, to be prepared for the Universities, &c.

**ASHFORD SCHOOL, KENT.**—Head-Master, E. C. MUSSON,

M.A., F.R.S., formerly Scholar and Prize-man of Queen's College, Cambridge, sometime Master in Cheltenham College. Very healthy situation. New buildings, separate cubicles, and a detached Infirmary. Terms low and strictly inclusive. Special preparation for Woolwich, Sandhurst, Legal and Medical Preliminary, &c.

**PREPARATORY SCHOOL, Langley Place, LANGLEY,**

BUCKS.

Mr. W. E. W. COLLINS, late Scholar of Jesus College, Oxford, and for some time Composition Master at Richmond School, Yorkshire, and Mr. LEONARD B. KEYSER, for four years Assistant-Master at the Rev. J. W. Hawtrey's, Aldin House, Slough, receive BOYS between the ages of Eight and Fourteen, to prepare for entrance on the Classical or Modern side of the Public Schools, or for the Royal Navy.

BOYS are also especially prepared for Junior Scholarships at any of the Public Schools.

Langley Place is a few minutes' walk from Langley Station, on the G.W.R.; is four miles from Windsor and two and a half miles from Slough. It stands on gravel soil, above the level of the Thames. The sanitary arrangements are excellent.

References and full particulars will be given on application at the above address.

**THORNDENE, OAKLEIGH PARK.** Station on G. N. R.

Miss MATHER has vacancies for DAUGHTERS of GENTLEMEN. Large detached house. Large garden. Healthy situation. London Professor. Pupils taken Honours at University Local Exams. Christmas Term will open September 20th.

**COLLEGE and GRAMMAR SCHOOL, AUCKLAND,**

NEW ZEALAND.—A HEAD-MASTER is REQUIRED for this Institution. He must have graduated in Honours at one of the leading Universities in the United Kingdom, and have experience and success as a Master in some important Public School. The salary will be £700 per annum, without house allowance, but with a Capitation fee of 10s. for every Pupil paying school fees. £150 will be allowed for passage money to the Colony.

The following gentlemen have consented to act as a Commission for the selection of the Master: Professor Blackie, of Edinburgh; Professor Jowett, of Oxford; Arthur Sidgwick, of Oxford; and the Rev. J. M. Wilson, Clifton College. Intending candidates can obtain of the undersigned application forms and printed statements giving further particulars as to the School, and conditions of the appointment, &c. All applications must be made on the forms, and be sent in on or before September 26 to WALTER KENNEDY, New Zealand Government Office, 7 Westminster Chambers, London, W.C.

## THE FENIAN CONVENTION.

VARIOUS sections of Fenians in the United States and Canada have been holding, in the last few days, a Convention at Chicago. It has been a very grand affair in its way. More than a hundred and twenty delegates met together, representing over six thousand lodges. Its proceedings were kept profoundly secret, and were regularly divulged at the end of each meeting. The objects of the meeting were principally two; to organize a grand revolutionary programme, and to decide whether dynamite was to be used, and, if so, when and where. There was no difficulty whatever in framing the revolutionary programme, and it was speedily and unanimously decreed that India should be instigated to rise against the English, that Canada should be annexed to the United States, that South Africa and Australia should be declared independent, and that the British Isles should be formed into a federation. But when it came to the use of dynamite there was a difference of opinion, one section protesting altogether against its use, and another maintaining that it must be used until the comprehensive object had been attained of annihilating the British army, the British navy, and the more objectionable members of the Royal Family. In order that there might be no vague talk about an agency that was unfamiliar to ordinary people, one instructor of his brethren attended with several specimens of dynamite machines and explained their operation. But this produced a chilling effect on the spectators; and, as the meeting was held in the basement of an hotel, the ordinary visitors of the hotel felt uncomfortable at the notion that they were sleeping over a knot of Irishmen experimenting on dynamite; and the proprietor found himself compelled to have a search made for the machines. As proper notice had been given, none were discovered, but the American public learnt with natural alarm that there were several towns in the States where dynamite machines were being constantly made at a very moderate cost. Whether the existing law gives the authorities power to search for and seize on such machines, and to prosecute their makers, appears to be doubtful; but the respectable press is unanimous in proclaiming that, if such a power does not exist, it ought to be conferred without delay. The dynamite section and the anti-dynamite section could not reconcile their differences; but their quarrel was swallowed up in two questions that touched them even more nearly. The fearful suggestion had been made that one of their most trusted members was a British spy, and what was worse, it was discovered or suspected that the depositories of the Skirmishing Fund had been making away with the money confided to them. This brought things to a climax. The dispute grew fiercer and fiercer, no one could maintain a semblance of order, and although five successive chairmen tried their hands, all retired in disgust. Anarchy, like charity, begins at home, and a meeting that was to shake an Empire ended in a pothouse brawl.

Apart from the use of dynamite, which was considered to be open to those delegates who liked to take advantage of it, there is nothing new and nothing alarming in the proceedings of this abortive gathering. It was not only an Irish, but a very Irish, Convention. The story of all Irish conspiracies is the same. There is always a traitor, or a supposed traitor, in the camp; and there is always a deadly quarrel over the funds. Nine-tenths, too, of this fierce Fenian talk is mere vapouring. Real conspirators

do not meet in a big hotel, and communicate to reporters every evening the decisions of the day. Fenians of the type that met at Chicago love, above all things, to make a sensation, and to feel that they are the heroes who are making it. They wish that the world should grow pale at their name. There is to them something magnificent in the thought that they are men who can order that the British Isles shall be made into a federation as easily as they can order a cocktail. It is only a few days since one of their gangs met in solemn conclave, and, after due deliberation, decided that Mr. GLADSTONE was a murderer, and must be put to death. They were delighted with this hideous farce, and immediately printed a full report of their proceedings in a newspaper. It is not in this way that the Nihilists work, who never cease, night or day, in their ghastly persecution of the new Czar, and whose secret operations seem more and more to baffle the Russian police. The Fenians take wholesale and immediate credit for everything that they think will do them credit. They reveal by whom the dynamite machines found at Liverpool were made, and by whom they were ordered. As these machines were discovered, the Fenians boast that they were meant to be discovered, and are ready with the name of the artful person who made a revelation to the British Government, and received a large reward, which he forthwith paid into the common fund of the conspirators. The only thing they do not know is what became of the money after it was paid in. What, it must be owned, is most genuine in the Fenians is their hatred of England. It is painful, and not a little wonderful, to Englishmen that there should be so fierce a hatred felt towards a country that, so far as living memory goes, has tried to be not only just, but tender, towards Ireland. There is no other country under the sun—certainly not the United States—which would have endured what has been done in Ireland in the last year with the patient tenderness and penitent meekness that England has shown. But we cannot be always rending our clothes and covering ourselves with ashes because, while we anxiously remove every grievance that Ireland can reveal or invent, the Fenians hate us as much as ever. It is not much we ask of the Irish in these days, but we really must ask that we should be permitted to exist.

For, although nine-tenths of the Fenian talk may be vapouring, there is a tenth which is by no means vapouring. Mechanical science has placed at the command of the enemies of society means more pernicious and more powerful than were known in former days. Dynamite and the new explosives that may be brought under it as a generic name, not only produce ruin and slaughter on a gigantic scale, but may be so employed that, at the time when they take effect, the murderers may be miles away. The Fenians, too, have spent some of their money in the construction of a torpedo-boat at New York, and though this is not a very dangerous form of doing mischief, because so patent an instrument of harm as a torpedo-boat, built under the eyes of the public, is tolerably sure to be seized or detained by the local authorities, yet that the Fenians thought it worth while to spend money on a torpedo-boat shows their readiness to profit by every kind of mechanical invention. Nor is there much comfort to be derived from the thought that the use of dynamite cannot possibly do the Fenians any good or bring about any of the objects at which they profess to aim. It is precisely because they do not really mean what they say they mean that dynamite is dangerous.

in their hands. If they seriously thought of upsetting the British Empire, they would not waste time in trying to blow up town-halls. What they want is to make a sensation and to get money, and every now and then they have to do something sensational and give subscribers something for what has been paid. They cannot be always advertising a grand display of fireworks, and then saying that every evening is wet. And what helps them very much is that dynamite makes a great sensation, gives a return to subscribers at an insignificant cost, and secures to the agents employed a very great chance of remaining undetected. When these agents happen to be caught, society can do something in its defence, and it is highly satisfactory that one at least of the scoundrels who made the recent attempt at Liverpool has been sentenced to penal servitude for life. But it must be remembered that detection has been extremely rare, and that, so far as is known, the consignors of the machines sent to Liverpool remain unknown. Unfortunately society cannot do very much to protect itself, but what it can do should be done promptly and thoroughly. The literature of assassination can at least be suppressed, and honourable Americans are as heartily of opinion as Englishmen can be that such a scandal as the publication of the sentence of death passed on the head of the English Ministry should be treated as an outrage on American law and American hospitality. Though, again, it may be very difficult, it seems by no means impossible to place the use of explosives like dynamite under strict legal supervision. A Fenian boasted at the Convention that he had long made dynamite machines, and should continue to make them, as it was as legal to make them as to make revolvers. If he is right, there is no difficulty in rendering it utterly illegal to make dynamite machines. The difficulty is to enforce the law. Men who are honestly engaged in making inventions for legitimate purposes, or supplying miners and engineers with what is necessary for their business, must be allowed to have explosive materials at their command. But it at any rate deserves consideration whether by a system of licences, and by giving large powers of search when unlicensed persons are suspected, the malicious use of explosives might not be greatly limited, if not altogether prevented.

#### THE HOUSE OF LORDS.

THE agitation against the House of Lords, which is principally stimulated by the *Daily News* and the *Pall Mall Gazette*, though it is consistent with modern revolutionary doctrines, seems in some respects inopportune. There can be no doubt that the existence of a hereditary branch of the Legislature forms an impediment to the establishment of absolute democracy. The theoretical arguments against the House of Lords are familiar and independent of circumstances; but assailants of the Constitution have generally strengthened their appeals to popular jealousy and envy by the suggestion of some practical inconvenience. It is scarcely sufficient to accumulate several instances of differences of opinion between the two Houses spread over fifty years. Two nominally co-ordinate and independent Assemblies are not likely always to take the same view of public interests. If the result of the disinclination to change, which may be fairly attributable to the House of Lords, had been either habitual collision or permanent interruption of a beneficial legislative policy, there would be some excuse for dissatisfaction and impatience; but the complaint that at long intervals Liberal measures have been delayed for a year or two, or occasionally modified, is not calculated to provoke indignation. It is true that in Lord LINDHURST's time the House of Lords became, under his guidance, somewhat more reactionary than the great body in the House of Commons which followed Sir ROBERT PEEL; but in every case of an apparent party schism, the more enlightened policy prevailed after a short delay. In 1860 the House of Lords, with the uncoined connivance of the Prime Minister, interfered with one of Mr. GLADSTONE's Budgets; but in the following year the Paper duty was repealed without further impediment; and the claim on behalf of the House of Lords of a right to control financial arrangements has been since that time tacitly abandoned. It is not a little surprising that an industrious and bitter partisan should be able to collect so few examples of persistent antagonism on the part of the less popular and less powerful branch of the

Legislature. The supposed misdeeds of twenty or thirty years ago, even if they were confessed, must have been long since condoned. It is not, at first sight, a grave offence to offer occasional resistance to sweeping legislation.

The number and magnitude of the innovations which have been during the same period accepted by the House of Lords suggest a reasonable doubt whether the progress of change has been unduly checked. Some of the great Liberal measures were notoriously distasteful to the House of Lords; but the leaders of the Conservative party have again and again persuaded the Peers to yield to necessity or expedience. The Corn Laws were repealed in the first Session in which a Bill for the purpose was introduced into Parliament, although the great majority of landowners then anticipated as immediate the deterioration of property which was, in fact, postponed for more than thirty years. The Irish Church disestablishment and the Irish Land Bill of 1870 were almost equally distasteful to the House of Lords; but in both cases prudence prevailed against inclination and conviction. Serious politicians within and without the House of Lords fully understand that the democratic concessions of a Minister become inevitable and irrevocable, not from the time at which they are passed into law, but from the date at which they are proposed. Conscientious disapproval of the Irish Land Bill is perfectly consistent with a recognition that the measure, as soon as it was announced, became the low-water mark of agrarian legislation. The cause of the Irish tenants was gained from the moment at which Mr. GLADSTONE's repugnance was, according to general belief, on the eve of the Session, suddenly converted into enthusiastic approval of every doctrine on the subject which he had formerly denounced. The taunt which was addressed to the Opposition in the House of Commons, to the effect that a Conservative Ministry would have to pass as strong a Land Bill, might be ungenerous, but it was not unfounded. When EPICURUS had sold the secret of turning the pass of Thermopylae, he probably ridiculed the obstinacy of the Three Hundred who still resolved to defend it. The House of Lords is not called upon to imitate suicidal heroism. Its privileges are not its own to risk or sacrifice; for, as long as they remain, they are held in trust for the nation. The decision of the leaders not to oppose the second reading of the Land Bill was at the same time judicious and patriotic.

As far as the House of Lords has been able and willing to check the advance of democracy, it has represented the opinions of the Conservative part of the community; but of late the Peers have been charged with a new and important function. It is in their House that moderate Liberals now find the opportunity of expressing and asserting their dislike to revolutionary measures. The Disturbance Bill, which was last year extemporaneously devised by Mr. FORSTER for the first time, conspicuously illustrated the altered relation of the Liberal party to the House of Lords. Whig peers have no Jacobin Club at Birmingham or elsewhere to control their political action; and they are therefore at liberty to avow the principles which were not long since held by the section of their party which represented the whole body. The consequence was that the Disturbance Bill was rejected in the House of Lords by a majority of Mr. GLADSTONE's regular supporters. The Duke of ARGYLL, the Marquess of LANSDOWNE, and the other Liberal Peers who endeavour to improve the Land Bill represent the opinions of all the moderate Liberals in the House of Commons and the country. The enemies of the House of Lords have many motives for their agitation; but of all the qualities of an aristocratic Assembly they most utterly dislike independence and freedom of speech. To less prejudiced politicians it seems expedient that opinions held by an overwhelming majority of the upper and upper middle classes should be openly expressed and argumentatively defended, although the will of the greater number may be destined to prevail; but democratic agitators would gladly reproduce in England the servile uniformity of insincere opinion which was imposed on Frenchmen in the worst part of the Revolution. If the occasion were less serious, there would be something ludicrous in the censures pronounced on the Peers who have at the same time demonstrated the vices of the Land Bill and submitted to the necessity created by the Government. Reasoned protest against the triumph of false principles has not always been deemed ridiculous and contemptible.

Another motive for antipathy to the House of Lords is the ability habitually displayed in its debates. With the exception of Mr. GLADSTONE, and, on great occasions, of Mr. BRIGHT, no speaker in the House of Commons takes so comprehensive a survey of great questions as that which is customary in the House of Lords. The superiority of the Upper House is not exclusively due to the possession of greater ability. The Peers are much less trammelled by considerations of party convenience, and yet they are subject to a stricter discipline. Great debates are almost exclusively conducted by political leaders and by peers who have a special knowledge of the subject under discussion. The rank and file are probably on the same intellectual level with ordinary Englishmen of the better classes; but they submit the result of the campaign to their officers. Freedom of debate, which is of all other practices most odious to *demagogues*, is now confined to the two Houses of Parliament. The mass of English politicians derive their knowledge of public events each from a single newspaper, which, while it flatters and confirms the predilections of its readers, carefully abstains from noticing the arguments on the other side. The modern rough has long since put an end to the public meetings at which in former times great questions were openly debated. No orator is allowed to speak, except at a meeting of his own supporters. Even Parliamentary discussion is in some danger, through the abbreviation and general deterioration of the reports; but even in the House of Commons, notwithstanding the pressure of constituents and the dictation of political clubs, opposite or varying opinions find to a certain extent secure utterance. The House of Lords, which is threatened if it stands on its rights, and insulted if it defers to the House of Commons and to popular demands, still retains the opportunity and the faculty of independent criticism and judgment. If it could be silenced, democratic agitators foresee that order, constitutional liberty, and justice would have lost their most efficient advocates. The House of Commons, when it is returned by a single class, may be trusted to exclude independence and originality. For obvious reasons, those who attack the House of Lords abstain for the present from raising the question whether it is desirable that there should be two Legislative Assemblies. Some of them suggest vague schemes for the reform of the House of Lords, though it is evident they would be disappointed by the effect of any change which might tend to strengthen the Upper House. It is evident that a Second Chamber, if it is to exist, ought to have weight and influence. The House of Lords and the Senate of the United States are the only bodies of the kind in the world which satisfy the necessary conditions. The French Senate is threatened with abolition or reconstruction, merely because it has ventured on two or three occasions to perform the duty for which it was instituted. M. GAMBETTA's condescending and provisional tolerance is more insulting than open opposition. It is extremely doubtful whether all the powers of the State will not in France soon be nominally as well as really vested in a single Chamber. A similar result would soon follow in England from the abolition of the House of Lords.

#### M. GAMBETTA AND REVISION.

THE principal incident as yet of the elections now in progress in France is M. GAMBETTA's declaration in favour of a revision of the Constitution. He had very different things to say about the Senate at Tours from those which he had said at Cahors. In less than three months the Senate has disappointed all his expectations, and forced him to reconsider the good opinion he then expressed of it. Still, it is not the principle of a Second Chamber that he is opposed to. A Senate which knew and did its duty, which never placed itself in antagonism to the Chamber of Deputies, which contented itself with picking up the dropped threads in the Bills sent up to it, and thought its mission fulfilled when it had found Conservative reasons for passing Radical measures, would still enjoy M. GAMBETTA's confidence. It is the actual Senate that he finds unendurable, the Senate that is persuaded by M. JULES SIMON, is subject to sudden paroxysms of natural religion, and presumes to have an opinion upon the best method of grouping the constituencies. He cannot wait for the slow process of triennial election to put an end to so anomalous an institution. A revision of the Constitu-

tion must, if possible, be had, because it is only by a revision of the Constitution that the existing Senate can at once be brought into harmony with Democratic ideas. M. GAMBETTA is content, however, to keep the change within the narrowest possible bounds. He is for reform, not revolution—at all events, until he is assured that only revolution will answer his purpose. The one point in the Constitution that he proposes to alter is the mode of electing Life Senators. Now they are elected by co-optation. M. GAMBETTA proposes that all the Life Senators shall submit to re-election, not by the Senate, but by the Senate and the Chamber of Deputies sitting together, and that this mode shall be adopted for filling up all future vacancies among the Irremovables. Possibly this particular reform was suggested to him by the circumstance that M. JULES SIMON would probably lose his seat in the process. It is pleasant to see justice done upon an old offender; and, when he is anxious to compass an object, M. GAMBETTA is not particular as to the exact proportion between means and ends. It is more probable, however, that his seat in the next Chamber is what he has in view. A programme of some sort has to be invented, lest his constituents should be beforehand with him, and offer him one which he cannot accept without frightening the peasants.

It would be no good to make *Scrutin de liste* his cry, because, though the Extreme Left, on the whole, give the preference to that method of voting, they never like it so little as when it is recommended to them by M. GAMBETTA. They are convinced that he means it to minister to his own personal aggrandizement; and, though they intend to have it by and by, when they have got other things about which they care more, they are not going to be turned from those other things merely to place M. GAMBETTA at the head of the poll in a score of departments. It is necessary, therefore, that he should invent something which may associate him with the Extreme Left in appearance while it can be painted, when it is convenient to do so, in fairly moderate colours. The revision of the Constitution, undertaken in order to effect a change in the method of appointing Life Senators, has this double merit. Revision of the Constitution is the first article of the Socialist programme which is accepted by his Radical opponents. It plays the principal part in all the speeches which are being made every night in Paris. Consequently, if it plays a similar part in M. GAMBETTA's own speeches during the canvass, the electors of Belleville, who, in spite of M. CLÉMENTEAU's efforts to disabuse them, are still perhaps secretly proud of being represented by so great a man as M. GAMBETTA, may not inquire too closely how far the resemblance extends. Even if they do, he can still remind them that the first thing for them to consider is, not what they want, but what they can get. The revision of the Constitution in the sense in which M. GAMBETTA's constituents use the phrase is no doubt a much bigger and finer thing than the revision of the Constitution in the sense in which M. GAMBETTA himself uses it. But, then, he will remind them that a revision of the Constitution which includes the abolition, not only of the Senate, but of the Presidency of the Republic, is not likely to obtain the consent of the present holders of these positions, and that without their consent it can only be obtained at the cost of a revolution. M. GAMBETTA perhaps calculates that, though his constituents might like nothing better than a revolution, they are not so impractical as to think that a revolution would have any present chance of success, and that in that case they may be tempted by the small measure of revision which he offers them as an instalment. That, at all events, has the advantage of hanging within reach.

Why M. GAMBETTA should think that it hangs within reach is not very obvious. The consent of the Senate is indispensable to any revision of the Constitution, whether small or great. Why should a Chamber in which Conservatives and moderate Republicans have the majority deliberately consent to a change which would leave them in a decided minority? The *République Française* warns the Senators that, if they do not put their house in order now while they have still the chance, their last state will be worse than their first. If they reject this gentle medicine now offered, a much stronger physic will be administered to them, not by the Extreme Left only, but by the whole Republican party. They may refuse to swallow the dose, but if they do, they will be upset by the first chance assault, and have the discomfort of remembering that they have been instrumental in giving over their country into

the hands of a single assembly. It will be strange if the Senate is much impressed by this reasoning. When the *Scrutin de liste* was presented to it, it had at least something to gain by surrender. It might have secured M. GAMBETTA for a friend and patron. But, in assenting to the virtual abolition of Life Senatorships, it makes a much greater surrender in order to gain nothing that is worth gaining. If the Senate were an institution venerable by age and associations, it might be prudent to give proof that it is not obstinately Conservative, that it can adapt itself to modern ideas and move with the times. But when a Second Chamber is only four years old, its one chance of maintaining its position lies in its success in defending itself against change. If it has not strength enough to resist being pulled to pieces almost before it has settled to its work, there is no chance that it will have more strength when its enemies will be able to plead that its working has now been tested, and that the result is unsatisfactory. A young tree that is continually being moved from place to place will never attain the proportions of one that has been allowed to remain where it was first planted, and an elective Second Chamber which allows the constitutional method by which its members are chosen to be revolutionized before the first complete period of renewal has come round is not likely to be allowed to see that period out. These considerations are so obvious that M. GAMBETTA can hardly suppose that the Senate has overlooked them when he urges the extreme Left to prefer the plan of doctoring the mode of appointing the Life Senators to the more sweeping proposal of abolishing the Senate altogether, on the ground that the Senate may be brought to consent to the one, while it will never be brought to consent to the other. He must know that, if the Senate shows as much determination as it showed in the matter of the *Scrutin de liste*, his prediction will certainly be falsified. The Senate, indeed, may not be supported in its resistance by the country. It is too much, perhaps, to expect that Frenchmen should go this length in favour of any institution whatever. But, in the present case, the Senate stands in no need of active support. All that it wants is that the country should not support its assailants, and to all appearance the country is prepared to remain as inactive, when appealed to, on this side as it certainly would, if appealed to, on the other. That the new Chamber will be more decidedly Republican than the last seems to be almost certain. The Legitimists and the Bonapartists have gained no ground since the last election; and, with the Republic in possession, not to gain ground is tantamount to losing it. But there is nothing to show that the new Chamber will be charged with any specific mission. The majority of its members will be elected because they are Republicans, not because they have pledged themselves to bring the Senate on its knees. Consequently, if the Senate refuses to consent to a proposal for the revision of the Constitution made to it by the Chamber of Deputies, nothing is likely to follow. There will be some fierce writing in the newspapers, and much talk about the tremendous things which the Chamber is about to do. But there the matter will end. The indifference which the electors showed when the Senate rejected the *Scrutin de liste* will be shown over again when it declines to be reconstructed because it has rejected the *Scrutin de liste*. With these reflections to console them, the Senate must have a singularly small stock of courage if it consents to a revision of the Constitution, which, if once conceded, will probably be repeated as often as the Senate happens to offend M. GAMBETTA. It is difficult to believe that M. GAMBETTA himself attaches any importance to his own programme. Possibly, however, it is only designed to carry him over some particular obstacle in his own personal canvass, and will be abandoned as soon as it has answered its momentary purpose.

#### THE LAND BILL.

THE final settlement of the Irish Land Bill has been delayed longer than was by some sanguine persons expected, and it is doubtful whether even the end of the present week will have seen its termination. This postponement is due to various causes. There can be no doubt that the Lords, with a possibly praiseworthy and certainly natural desire to minimize the injustice done by the Bill, acted in some of their amendments inconsistently with the principle which had guided them in their conduct on the

second reading. It was therefore inevitable that the Government should use their docile majority to restore the Bill to its earlier form. In so doing Mr. GLADSTONE displayed a certain amount of practical conciliation which was unluckily marred by a considerable asperity of conduct and language. It requires no more than a very rudimentary knowledge of human nature to be aware that such a position as is occupied by the present PRIME MINISTER is not good for man. He is master, not merely of one of the largest, but of one of the most absolutely and unquestioningly subservient, majorities ever known in the history of Parliament; and it also happens that no single member of the present House of Commons is individually a match for him in point of ability and authority. Only a great deal of moderation and a great deal of good humour could protect the possessor of such a position against the danger of domineering, and there are times when an unflattering critic might not be able to recognize either modesty or good humour as prominent features of the PRIME MINISTER'S disposition. The remarks which Mr. GLADSTONE made on Tuesday night as to the grammatical and stylistic defects of one of the Duke of ARGYLL'S amendments were, under the circumstances, in very doubtful taste; the absolutely uncalled for denunciation of a reasonable objection of Sir STAFFORD NORTHCOTE'S as "querulous" was still worse. The petulant rating of the Opposition and its leaders on Thursday night was worst of all. These things do not make rough places smooth. Nor was the actual conduct of the proceedings less open to criticism. The passion which the present ATTORNEY-GENERAL for IRELAND has for retracting and altering his own amendments in the course of a discussion is scarcely business-like. Nor has a more extraordinary spectacle been often presented than the muddle into which Mr. GLADSTONE led the House in the matter of the amendment giving a landlord access to the Court. The words of the Lords' amendment were rejected; its principle was then accepted; that principle was restated in a form so clumsy that the rules of the House prevented it from being inserted; and, finally, Mr. GLADSTONE had to give up the matter, with a helpless expression of hope that the Lords would after all come to the rescue, and reinsert something of the same kind which they had inserted before. It is a fact curiously ignored by certain critics, and curiously illustrated by this incident, that, whatever may be the respective merits of the Upper and the Lower House, the former, at any rate, understands its business.

There can be all the less reason for a serious disagreement between the two Houses, that it is already evident that the work of the Peers has not been wholly thrown away. There were four points of undoubted importance on which the Lords made amendments, not in any way opposed to the spirit of the Bill, and calculated greatly to improve its working. The first was the practical exemption of English-managed estates; the second was the liberation of the landlord from the disabilities imposed on him in the matter of going into Court; the third was Lord CAIRNS'S check on collusive sales, and the fourth the extrusion of Mr. PARNELL'S intrusive and almost surreptitious amendment, suspending executions pending an appeal to the Court. The first point has been practically decided by public opinion ever since the narrow defeat of Mr. HENEGAN'S amendment, and its tardy and grudging acceptance prevents the perpetration of a wrong of the most monstrous kind. The prevention of collusive sales is a working detail of no small importance. But the admission of the landlord to the Court, which after the bungling already commented upon Mr. GLADSTONE has ungraciously invited the Lords to reinsert in Mr. BRAND'S formula is, from the point of view of public policy, most important of all. According to the most favourable description of it, the Bill is a measure for defining, as far as possible amicably, the relative shares of two partners in a complicated concern. Mr. FORSTER, indeed, with the quaint, and ingenuous unconsciousness which often distinguishes him, and which must make him a somewhat inconvenient colleague, has in these last discussions taken up the very description of the Bill which unfavourable critics gave of it at the first draft—that it is a measure for presenting every tenant in Ireland with a fifteen years' lease. However this may be, it is clearly for the public interest that the amounts of the shares or the terms of the lease should be settled as soon and with as little heat and wrangling as possible. If the tenant desires such a

settlement, the measure as it left the Commons gave him every opportunity for obtaining it. But if the landlord desired it, he was bound to go through the formality of demanding an increased rent. The effect of this is unmistakable. Rent-raising is the one thing that Irish tenants hate and protest against, and the main thing that the Bill is constructed to prevent. It is notorious that an Irish tenant will rather take a farm at an exorbitant rent to begin with than have a low rent "raised on him," even to a perfectly fair amount. Why the landlord should be compelled to assume this invidious attitude before he can have the benefit of the law, it is impossible to see. Moreover, it is obvious that he is thus not only saddled with an unfair odium, but that he is actually prejudiced in his character of suitor. Instead of being an applicant in the ordinary way of business for a valuation of his property, he becomes practically defendant in a suit brought against him by his tenant for extortion. And this suit, it is to be remembered, is tried before a tribunal composed of persons who are likely to regard rent-raising with an unfavourable eye. There can be no hesitation in saying that, if the Bill is really intended to be a message of peace, its framers could not have chosen any better means of sending, not peace, but a sword, than the infliction of this extraordinary disability on the landlord, and that there is no point of the Bill at which the House of Lords would be better justified in maintaining an attitude little short of uncompromising. But the Government have indicated the lines of a compromise on this point as on others. Even in replacing Mr. PARNELL'S amendment, they have taken the sting out of it by the limitation to three months; and in doing the same with their own provision as to the status of leasehold tenants at the end of the lease they have opened a door, or at least left it ajar, for resumption. The curious mixture of ostentatious firmness and practical concession (the measure of which may best be judged by the wrath of the Land League members) is characteristic of Mr. GLADSTONE, and it ought not to irritate either the Commons or the Peers. Mr. GOSCHEN'S advice, though given with a want of tact almost amounting to offensiveness, was well meant and sound enough in substance.

The conclusion of this weary business must now, unless unforeseen and most unfortunate difficulties arise, be a matter of days, perhaps only of hours, and the message of peace will soon be speeded across St. George's Channel. Prophecy as to its results would seem to be unusually dangerous, were it not that prophecy as to Ireland has seldom been falsified when the prophets have chosen to be guided by the facts and by common sense. In no country, perhaps, are physical conditions so obvious, so simple, and so easily comprehensible, and certainly in none is the character of the people more marked and more unchanging. The Land Bill is the latest of a series of attempts to ignore each of these sets of facts. It might contain in its preamble (if circumstantial preambles were still in fashion) a description of Ireland as a country of uniformly rich soil, favourable climate, abundantly provided with minerals, and admirably adapted for the seat of manufactures of every kind; a description of the Irish as industrious and thrifty, averse from agitation, specially distinguished by their respect for the law and for human life, and incapable under any circumstances of refusing to discharge the undertakings into which they have entered. Such a description would only be a compressed and emphasized expression of the neglect of social, historical, and economic facts which characterizes the Bill as a practical measure. From another point of view it is sufficient to say that it is the first measure of importance in the history of England since the establishment of constitutional government which takes the property of one man and gives it to another, not only without compensating the loser, but with an express denial on the part of its framers of his right to compensation.

#### MR. BRIGHT ON THE HOUSE OF COMMONS.

**B**OTH in the House of Commons and at the Mansion House the Ministers have announced that the first business of the next Session will be the indispensable alteration of the rules and Standing Orders of the House. The object is in the highest degree desirable, but the task which the Government has undertaken is extremely diffi-

cult. The problem is not to adjust the methods of conducting business to the convenience of members who are all interested in the maintenance of order and of freedom of debate, but to restrain the license of a factious minority which deliberately attempts to render the proceedings of the House of Commons ridiculous and abortive. Mr. GLADSTONE and his colleagues, after many attempts to conciliate Mr. PARNELL and his followers, no longer struggle to sustain the respectable fiction that contumacious obstruction is the result of accident or error. As judges used to say in the days of special demurrers, it is sometimes necessary to exercise a little common sense. The House of Commons has an enemy within its gates, and not a mistaken body of loyal members. Until the experiment has been tried, it is impossible to ascertain whether any assemblage of men for combined action can dispense with good faith on the part of its members. Coercion of offenders may be the unavoidable alternative; but in causing the suppression of absolute freedom of speech the obstructive faction will already have attained a partial success. A great change has been effected, almost without observation, in the course of the present Session. In the hope of checking wilful irrelevancy, the House has allowed the Speaker and the Chairman of Committees to interrupt any member who is thought to digress from the immediate issue. In the impartial discharge of a novel duty the presiding officer has sometimes called to order party leaders, and even Ministers of the Crown, who have not confined themselves to some narrow point in the discussion. In former times it was not found necessary to remind members of every casual deviation to the right hand or to the left. A stricter discipline has been established merely because the House contains a little knot of wilful and malicious trespassers.

In his speech at the Mansion House Mr. BRIGHT disclosed the nature of some of the remedies which are to be provided, and he added reflections which, if they are not in themselves original or startling, become interesting when they are promulgated by the great democratic orator. It appears that the House of Commons will be asked to provide means of silencing any orator who may be deemed unduly tedious. A reduction in the number of stages through which a Bill is required to pass will be unobjectionable; but it may be doubted whether the change will effect the purpose for which it is to be introduced. There will always be abundant opportunity for making long speeches; and it is not obviously expedient that, "when a man has said what the House considers enough, there should be a means of reducing him to silence." A majority inspired by party feeling, and instigated by political Clubs, such as the Birmingham Association, may perhaps hereafter hold that a moderate member has said enough when his arguments begin to be embarrassing. There would never have been any difficulty in suppressing obstruction if the House of Commons had been content at the same time to abolish freedom of debate. As it will hardly be thought proper to vest the power of interruption in the Speaker or Chairman, a vote must be taken on the question whether a tedious member is to be allowed to proceed. The Land League members are perfectly capable, even if discussion is not allowed, of interposing a dozen calls to order in the middle of any speech which they may happen to dislike. Mr. BRIGHT may perhaps not have intended to pledge himself to the specific measures which he suggested as desirable; but almost any possible contrivance will be liable to similar criticism. If debate is to be as free as at present, precautions against obstruction will be no better than ropes of sand; and, on the other hand, schemes for silencing troublesome members run counter to all the best traditions of the House. The device of suspending members who have disregarded the SPEAKER'S warnings has not been wholly ineffective; but exclusion from the House is an anomalous and inconvenient penalty. The practice of moving the adjournment of the House as a pretext for speaking on miscellaneous topics will probably be abolished. It is well that the Government will have ample time during the recess to mature the proposals which will be ultimately made. The House will receive its suggestions with a genuine desire to accomplish the object; and even if he is opposed, Mr. GLADSTONE, with his majority at his back, will have ample power to legislate.

Mr. BRIGHT, who from time to time extricates himself from the grooves of party, as in his denunciation of the querulous helplessness of Irish patriots, made some curious

remarks on the present and on former Parliaments. In his opinion the existing House of Commons is superior to all its predecessors in intelligence and ability; but even the aggregate impersonation of the calm wisdom of the Midlothian speeches has some petty defects which it would do well to correct. Its excellences are to some extent impaired by the prevalence of vanity, of obstinacy, and of spite. The majority of which Mr. BRIGHT was probably thinking directs its spite against the late Government and the Conservative party; the vanity has had little opportunity of displaying itself during a Session in which independent members were rarely allowed to speak; the Ministerial party may be acquitted of obstinacy when it has implicitly obeyed Mr. GLADSTONE, with the sacrifice on the part of all moderate Liberals of their deepest convictions. It is true that the House of Commons contains many members who are capable of attaining more or less distinction if they were not dwarfed by comparison with their chief. The exclusive and single-handed conduct of business which Lord HARTINGTON justly attributed to Mr. GLADSTONE is likely to be repeated as long as he leads the House of Commons. Mr. BRIGHT, having been apparently troubled by a suspicion that Parliament had degenerated, once consulted the old Chief Clerk of the House whether Lord PALMERSTON'S great *Pacifico* speech was equal or superior to those of former times. Mr. LEIGH replied that there was no man in his youth who could have made such a speech, and not ten who could have understood it; but that in those days only a few members took part in debate. The official veteran was unduly severe on Parliaments which were exclusively composed of men of property and education. It is not at first sight obvious that a customary limitation of the number of speeches might not conduce to the efficient transaction of public business. The old practice still survives in the House of Lords, where by common consent the debates are superior to those of the more popular Assembly.

The oddest and the soundest proposition enunciated by Mr. BRIGHT was that the House of Commons ought, for the efficient discharge of its duties, to be animated by a gentlemanlike spirit. It is only as proceeding from a zealous and consistent advocate of democratic equality that such a doctrine resembles a paradox. Mr. BRIGHT, as might be expected, proceeded to explain that the qualities which he desiderated were not acquired by University education, and that they were not necessarily associated with rank, with wealth, or with any social station. He had known, he said with truth, persons who, though formerly working-men, were unobjectionable in sentiments and manners; but nevertheless gentlemanlike demeanour is most commonly found among gentlemen. It is in vain that levellers deride the effect of intellectual and social culture, and that ostentatious agitators for education refuse to recognize the superiority which it tends to confer. In DICKENS'S novels squalid haunts of poverty, the debtors' prison, and the streets, are the favourite nursing-places of moral excellence, though in his personal capacity the satirist was a zealous and useful promoter of all projects for the social elevation of the poor. One of his reasons for disbelieving in the advantages of constitutional government was that in his time both Houses of Parliament were aristocratic bodies. Mr. BRIGHT is more orthodox in his political creed, as far as the House of Commons is concerned; but he is not likely to elevate its standard of gentlemanlike feeling by lowering the qualification of the constituencies or by inviting the dictation of intolerant clubs. The obstinacy and vanity which he deprecates will be more prevalent as the upper classes are gradually eliminated from the representative body. The standard of taste and manners in American Legislatures is not considered by their countrymen to be extraordinarily elevated. There was, perhaps, some connexion between the modest taciturnity of old-fashioned Parliaments and the unquestioned position of their members in society. University education, if it does no other good, has the great merit of convincing all students, who are not simpletons or coxcombs, that they are surrounded by equals as capable as themselves. Mr. BRIGHT himself, though his intellectual education may leave nothing to be required, would perhaps have been less positive and more patient of contradiction if he had in his youth competed with rivals as highly cultivated, if not as able, as himself. He deserves credit for calling attention to the worst defect of the House of Commons and to the ideal remedy. If the House, or its most turbulent sections, were penetrated with gentlemanlike

feeling, the evils which the Government will painfully endeavour to correct would at once disappear. Vanity, obstinacy, and spite are human tendencies, but they are inconsistent with gentlemanlike feeling.

#### RAILWAY RATES.

THE Report of the Committee on Railway Rates coincides in time of publication with the announcement of the half-yearly dividends. The witnesses who have urged on the Committee unscrupulous spoliation of railway property will not be induced to reconsider their opinions by the large diminution of the incomes of shareholders for the last half-year. Some traders and freighters regard railways and their proprietors much as the Land League and its clients are disposed to deal with landowners; and, if they are not in a position to command popular sympathy, they are well organized and formidable by their wealth and their influence. The arbitrary reduction or equalization of rates which has been urged on the Committee, would affect in the first instance and to the greatest extent the holders of ordinary stock. Shareholders have invested their money in enterprises which are not secured by any guarantee; but the risk of loss is confined within calculable limits as long as Parliament adheres to the terms of the contracts on which money was advanced. That the investments have not been considered as of a speculative character is proved by the smallness of the percentage which railway shares return on the market price. If the half-year dividends had not been reduced, the ordinary stock of the best Companies would not have paid four per cent. on the average prices which have ruled since the beginning of the year. The actual profit is considerably less; and, as a railway manager informed the Committee, the entire dividend on open stock is paid out of seventeen per cent. on the gross receipts. A little unfair manipulation of rates would involve the ruin of the capitalists who have done more than any class of the community to increase the wealth and prosperity of the country. But for the ventures of ordinary stockholders, the larger sum which is invested in debentures and preferences would never have been advanced. Some of the Liverpool witnesses, who of all the assailants of the Companies were most extravagant in their demands, had so far the merit of consistency that they affected to doubt whether their city had gained anything by the introduction of railroads; yet the payments which they grudge necessarily bear but a small proportion to the value of the trade which they serve, and of which they indicate the dimensions.

Mr. FARRER, of the Board of Trade, clearly exposed some of the fallacies of the trading witnesses; and he called attention to the fact that they represented only producers, while the interests of consumers are in many cases identical with those of the carriers. Some Liverpool freighters scarcely concealed their desire of acquiring a monopoly of the best market in England by the adjustment of rates to the distance traversed. Other producers objected to the comparatively low rates which are charged when railways compete with transit by sea. The effect of prohibiting the practice would be to deprive the Companies of a moderate profit, and to raise the price of commodities, which would no longer find two competing modes of conveyance. Large mining and industrial districts would by a similar process be ruined through their inability to contend with rivals who happened to be nearer to the markets. It seems at least probable that railway managers in adjusting their rates consult the interest of the greatest number, because it is their object to accommodate the largest amount of traffic. The complaints that the Companies had in some instances exceeded their lawful charges resolved themselves into a dispute as to the right to receive terminals for services performed in receiving and delivering goods, in addition to the charges for carriage on the line. There could be no doubt of the propriety of abolishing any illegal excess; but the object might have been attained in the ordinary course of law without the intervention of any Committee. Among thousands of freighters it would be strange if no one was found to refuse payment of an illegal demand. A passenger, who may perhaps have had an unusually litigious temper, lately attempted to obtain redress from the Railway Commissioners for a supposed overcharge of a halfpenny on his fare.

The Report of the Chairman, Mr. ASHLEY, seems to be

temperate and reasonable; but railway proprietors will have observed with some alarm that it was only carried by a majority of one. The Committee recommends a new classification of goods which might probably be effected without difficulty, and the separation in the list of charges of the rates for carriage and the terminal charges. It is also proposed that the Railway Commission shall be made permanent, that its power shall in some cases be increased, and that Chambers of Commerce and similar bodies shall be allowed a *locus standi* on behalf of traders. It may be hoped that Parliament will not concede to the Commission a power to regulate rates on the application of private persons or public bodies. Such a jurisdiction would be exercised by the majority of the present Commission in a spirit hostile to the Companies; and it would be intolerable that any tribunal should be allowed to repeal or overrule Parliamentary tariffs. There is no doubt that the functions of the Commission will be enlarged; and the opportunity of remodelling its constitution ought not to be neglected. Experience has in this case more than confirmed the general proposition that judicial functions ought to be exclusively entrusted to lawyers. The Commission has never commanded the confidence of litigants; and consequently it has had little to do. The business which it has transacted would have been much more satisfactorily managed by a single professional judge, who, unless his greater competence increased the amount of litigation, would not have found occupation for more than three weeks in the year. The administrative duties of the Court are much less complicated and less important than those of a judge in the Chancery division. There is no reason why the successor of the present Commission should not, like the chief judge in Bankruptcy, be a judge of the High Court, both for the augmentation of his authority, and that his services in the intervals of railway business might be available for general purposes. A saving of five or six thousand a year would be the smallest of the advantages which would result from the proposed change.

The dividends of the great Companies have, in almost every instance, fallen short of last year's amount. The half-yearly reports attribute a part of the reduction to the snow storms of January and February. The actual expense of clearing the lines and keeping them open amounted in almost every case to many thousands of pounds, and the traffic, especially in passengers, was at the same time greatly diminished. A more permanent cause of dissatisfaction is the stagnation or slow progress of trade. The expectations of last year have been disappointed, especially in the case of the iron and steel trades, in which the prices are much lower than during the apparent revival of 1880. Some Companies have begun to experience the bad effects of the German tariff. If the Commercial Treaty with France should fail, another large reduction of traffic will be inevitable. In the first three months of the year the returns of the London and North-Western Company fell off to the amount of more than a hundred thousand pounds; but the deficiency was covered by the returns of the second quarter, leaving a small increase in the gross receipts. To maintain the rate of profit, it is not sufficient that, as in the half-year's return of the Great Northern Company, the receipts should be almost exactly the same with those of the previous corresponding period. No Company finds it possible to close its capital account, and consequently in every succeeding year a larger amount is required to maintain the same rate of dividend. In the majority of cases the necessary sums are raised by the creation of preference stock, and more rarely, in the legitimate exercise of the discretion of the Boards, ordinary stock is issued either at its nominal value or at a premium which brings it below the market price. Hasty theorists have erroneously contended that a bonus to each shareholder involves a loss to the whole body. During the month of July the traffic returns have, with two or three exceptions, been moderately satisfactory; but there is hitherto no sufficient indication of a general improvement of trade. The fine summer will probably produce a good harvest, to the direct advantage of some railways, and with the probable consequence of a partial revival of trade. The reports of the Scotch Companies, which are not yet issued, are not expected to justify sanguine calculations. Both the Caledonian and the North British Companies depend largely on the iron and coal trades, which are still in a state of depression. The North British Company has for some time been weighed down by the

consequences of the Tay Bridge disaster. Till the new bridge is finished, the traffic will be impeded; but at some future time the Northern route of the Company will be greatly improved. A Bill for the abandonment of the Forth Bridge was withdrawn, and a new scheme which involves no risk of failure has been sanctioned; but some years must elapse before the works can be completed. Few Chairmen, in addressing their shareholders, failed to notice the hardships of the Passenger tax, and the scandalous injustice to which Railway Companies are subject in the assessment of local rates. Unions which derive enormous benefits from the lines which traverse their districts throw upon them the greater part of the burden of local expenditure, from which the Companies derive little or no advantage. It seems hopeless to expect redress from legislation, for Parliament shares the common delusion that associations possessing large capital are exceptionally rich. Thousands and thousands of shareholders are dependent on scanty incomes derived from railway investments which they may be supposed to have chosen in reliance on the good faith and equal justice of Parliament. They cannot be expected to listen with complacency to the claim of wealthy traders or of owners of rateable property to be further enriched at their expense.

#### THE PROPOSED EDUCATION CODE.

MR. MUNDELLA had unusually interesting matter to deal with when moving the Education Estimates. After he had marshalled his figures in proper array, and set out the percentage of growth in the several elements which make up elementary education in its public and administrative aspect, he enjoyed the rare pleasure of telling a large number of persons things which they were exceedingly anxious to hear. Whether the House of Commons cared to listen to him did not matter; he was sure of a public out of doors. There is hardly a school manager or a school teacher in the kingdom who did not open his Tuesday's paper with excited curiosity. These changes in "Article 19 B" and "Article 19 E," which appear of such little moment to other readers, were to them big with ban or blessing. Upon their working will depend the issue which is always in the mind of managers and teachers—Will the Parliamentary grant to my school be greater or less in the future than it has been in the past? Success in benevolent labours, or in a toilsome and thankless career, may be secured or rendered doubtful by these seemingly trifling alterations. For months to come little else will be talked of in country parsonages, in the committee-rooms of Board Schools, and wherever teacher meets teacher. There is no fear that Mr. MUNDELLA will find the suggestions he invites come in too slowly. The *Guardian* is, no doubt, preparing for the weekly supplements which will with difficulty contain a tenth part of the letters it will receive on the subject; and the Education Department, if it is well advised, will already have secured the services of a temporary staff of additional clerks.

The changes of which Mr. MUNDELLA gave an account on Monday are not to take effect until next year. If they are generally accepted as improvements, they will be incorporated into the Code of 1882. For the first time the Education Department has descended from its position of majestic isolation, and allowed itself to be influenced by the criticisms of common men. Considering what the main function of the department is, we are not quite sure that it is doing wisely. It is well, no doubt, that the law should be adapted to the needs of those in whose interest it is framed, and it may seem that on this principle school managers and school teachers have a just claim to be consulted upon the conditions on which the Parliamentary grant is distributed. But school managers and school teachers are not the persons in whose interest the law which governs this distribution ought to be framed; that character really belongs to the persons who have to find the money out of which the Parliamentary grant is paid. The suggestions from which Mr. MUNDELLA hopes to derive enlightenment ought to come from the taxpayers; they will really come from the tax-spenders. The system which will most commend itself to managers and teachers will be the system which most increases the amount they can earn and enables them to earn it most surely. The stipulations with which the distribution of the grant are fenced round are so many guarantees that the taxpayer gets value for his money; to managers and

teachers they are apt to seem so many barriers set up to prevent them from getting the money they have earned. Every suggestion that is offered to the department will be in the nature of a plea for greater laxity. Is it expedient that these pleas should be multiplied by direct invitation? A school manager who finds his grant reduced by the conditions laid down by the Education Department will seldom want a plausible reason for urging that these conditions shall be made less stringent. It is only natural to feel that you deserve something more than that to which you can prove your title under a cold official standard. No doubt it is not to the public interest that the conditions should be made so severe as to check educational progress. There is no danger, however, of this happening so long as the amount of the grant goes on increasing. If the evidence of efficiency demanded by the department were really too exacting, schools would cease to offer it. So long as they go on earning more money every year the department can hardly be wrong in continually insisting on a larger educational return for the payments made.

The first of the changes announced by Mr. MUNDELLA is unintelligible without more explanation than is to be found either in his speech or in the text of the Code. "It is proposed," says the First Clause, "to adopt the average attendance in each school as the basis of the grants which have hitherto been made on account of individual scholars presented for examination." But in the Fourteenth Clause it is said that "the grant will be calculated on the results of the examination" of the scholars who have been on the school register for six months. Supposing, therefore, that the average attendance at a school is large, and the results of the examination of the scholars small, upon which basis will the grant be calculated? If it goes upon the average attendance of the scholars, what is the good of the Inspector's examination, and what guarantee will the department have that the grant is fairly earned? If it goes, as at present, upon the results of the examination, what becomes of the promise that the average attendance in each school is to be the basis? Lord SPENCER did his best on Thursday to explain the change; and it is possible that if it is thrown into the form of a sum in double Rule of Three, its meaning may become faintly visible by 1882. It is unfortunate, however, that the Education Department should not have been able to make its meaning clear before asking whether it is palatable? In the first instance, a large part of the correspondence with which the officials will be inundated will be directed towards removing an obscurity of their own creating. The second change is that 250 attendances will no longer be insisted on as a condition of examination. It may fairly be argued that, as the extension of compulsion makes school attendance more universal and more regular, the utility of this requirement grows less; but we fail to see the force of the reason by which Mr. MUNDELLA justified its abolition. The temptation to fraud that now exists will not really disappear with the requirement. Teachers will no longer have the motive they now have for falsifying the record of a child's attendances, but they will have another nearly as potent. The grant, as we have seen, is to be calculated on the average attendance in each school, and the higher the sum of attendances set down to each child's credit, the higher will be the return of average attendance. Unless the Education Department is prepared to take no account of attendance, and to make a grant for every child presented for examination, whether he has attended the school or not, a teacher will always be under a strong inducement to make it appear that a child has made more attendances than he really has. The provision that the grant will be based on the proportion of passes actually made to those that might have been made by the scholars examined would be important if it extended to all the scholars presented. It is confined, however, to scholars presented in the First and Second Standards. In these the Inspector will be allowed to take samples of the children present. If there are 100 children, for example, he may examine ten of them, and if eight of these satisfy him, he will reckon that eighty children have earned the grant. If this system were applied to all the children in a school, it would at least effect a considerable saving of time, however open it might be to objection on other grounds. When all Standards above the Second are excluded from its operation, even the saving of time becomes problematical.

A third change involves a partial return to the state of things which existed before Mr. LOWE introduced the

original Revised Code. In those days the Parliamentary grant was given in consideration of the general impression which the school made upon the Inspector. In other words, it was based on inspection, not on examination. Mr. LOWE left Inspectors free to inspect as well as examine, but he enacted that the results of the inspection should not affect the amount of the grant. By the Sixth of the new clauses the Inspector is directed to "have regard to" the organization and discipline, the employment of intelligent methods of instruction, and the general quality of the work in each school; and he will "have power" to recommend an additional grant on the average attendance varying in amount according as the school "is, in these respects, fair, good, or excellent." The combination of inspection with examination which is thus introduced is a decided improvement upon either of the two systems standing alone. It will necessitate, however, if it is to have a fair trial, a complete redistribution of the Inspectors' work. Men who are perfectly competent to examine individual children may not be in the least competent to pronounce on the organization and discipline of a school, or on the value of the methods of instruction employed in it. If Mr. MUNDELLA carries out the plan described in his speech, it will be possible to give both classes of Inspectors the particular duties for which they are qualified. He proposes to place the "very best" and "most trusted Inspectors" at the head of districts; to make them responsible for the work of all the other Inspectors; and to create a new class of Sub-Inspectors, recruited from schoolmasters and from Inspectors' assistants. With the variety of power which will thus be at the command of the Education Department, it ought to be easy to get every kind of inspection done by the Inspector or Sub-Inspector who is best suited to it. There are many difficulties in the way of giving effect to this scheme; but, in common with some other changes upon which we have not touched, it promises, if boldly and thoroughly worked out, to effect considerable improvement in the results of elementary education.

#### EMIGRANT SHIPS.

MR. CHAMBERLAIN has published a Minute on the accommodation and treatment of emigrants on board Atlantic steamships, and has appended to it the reports and evidence on which his conclusions are founded. The question was raised by a letter from Miss CHARLOTTE O'BRIEN which appeared in the *Pall Mall Gazette* of the 6th of May last. This letter was evidently written under great excitement. It recorded a visit paid by Miss O'BRIEN to an emigrant ship at Queenstown. She went over the emigrants' quarters in the daytime, when, as she herself says, they were "empty, swept, and garnished," and she pictured to herself what these same quarters would be when "in the darkness of night, the ship pitching in mid-ocean, a glimmering lamp or two makes visible a mass of moaning humanity." To all appearance Miss O'BRIEN has mixed up in her general attack upon emigrant ships what she saw with what she fancied. Her picture, for example, of an "innocent girl-child lying amongst dissolute men and abandoned women, half-stupified with suffocation and sea-sickness, amid the curses and groans of hundreds," and, "if she arise and flee to save her soul," forced to "tread on the writhing bodies of men and women," is entirely imaginary. Miss O'BRIEN, indeed, assures us that "this is no brutal and impure dream." It is "the truth," "the living horror menacing the life, honour, and soul of hundreds and thousands of our fellow-countrywomen." And immediately afterwards she speaks of "the ship on which I saw these things." But the "things" she actually saw on the ship were the emigrants' quarters in the daytime, when, on her own showing, they were "empty, swept, and garnished." The rest was so far a dream that it was at most Miss O'BRIEN's conception of what was likely to happen at night when the ship was out at sea. It was quite right, no doubt, to call attention to the possible evils that might result from the arrangements which she saw; but the distinction between the possible and the actual should have been carefully maintained. It is one thing to ask, "What is to prevent such and such things happening in a ship filled up in such and such a way?" and another to call upon the reader to "look on" these things as though they had actually happened under Miss O'BRIEN's own

eyes. The Board of Trade has done quite rightly, however, in inquiring into the charges made or implied in Miss O'BRIEN's letter, though when Mr. CHAMBERLAIN says that her statements "have now been thoroughly investigated" he is a little in advance of the facts. The witnesses examined were, with one exception, partners in or servants of the Shipping Companies, which were virtually on their trial. This evidence is most valuable as regards the intentions of the Companies and the means adopted to give effect to them; but it tells us very little as to the success of these means. The only way to have come to a satisfactory conclusion on this head would have been to examine persons who have made a voyage in the steerage of an emigrant ship. Lord MONTEAGLE in a letter to the *Standard* says that he is satisfied from letters which he has seen that trustworthy testimony of this kind is to be had; and considering how many persons have left this country as emigrants and since returned, it can scarcely be doubted that he is right. The two chief questions on which the inquiry turned could not be adequately investigated except by the aid of those who have made the voyage and watched the working of the arrangements assailed.

When Miss O'BRIEN's charges are stripped of the vivid colouring they derived from her imagination and reduced to their bald simplicity, they come to two—the non-separation of the sexes in the case of married couples, and the opportunities left for communication between single women and men whether single or married. Miss O'BRIEN contends warmly for the provision of separate sleeping accommodation for husbands and wives. She would have the men's berths placed in one part of the ship; and those of the women and children in another part. Miss O'BRIEN says positively that those who know Irishwomen best have no doubt that they would rather be separated from their own husbands than endure the compulsory companionship of other women's husbands. On the other hand, the witnesses examined by the Board of Trade are, for the most part, of opinion that the separation of husband and wife would be exceedingly unpopular among emigrants. The women, they say, feel the presence of their husbands a protection, while their presence acts as a check upon the husbands. A delicate wife cannot attend to three or four children in the night-time, and who beside her husband is likely to be willing to help her? Very often the family bring their bedding with them from home, and if a man is separated from his wife he has nothing to sleep on. It is to be observed, however, that this evidence all comes from the owners of ships in which husbands and wives sleep together. On the other hand, the Passenger Manager of the Allan line, in which married couples are separated, thinks that it is better for the emigrants that husbands and wives should sleep apart, though he adds that in carrying out this regulation he thinks that his Company has suffered. If Miss O'BRIEN is right in her account, it might be well to have ships specially fitted up for the conveyance of Irish emigrants. It is doubtful, however, whether her suggestion that the unmarried women should sleep with the married women and their children would be altogether to the taste of those most concerned. An unmarried woman might reasonably object to be converted into a general nurse, which is the position Miss O'BRIEN marks out for her. Still, this difficulty might be got over if the men were in one part of the ship, the women with children in another part, and the single women and women without children in a third. To this solution, however, Miss O'BRIEN objects that it would enable the agents of the nefarious trade in girls to use the emigrant ships as a field for getting recruits for immoral purposes. On the whole, the balance of evidence seems to be against the change which Miss O'BRIEN recommends.

The other question is, whether there is a sufficient separation in practice between the unmarried girls and the men, whether married or single. What this really comes to is that the berths of the single women frequently open out upon a passage into which the men's berths also open, or that the staircase which leads to the berths is common to men and women. It seems clear that, under these circumstances, very objectionable things may go on if the girls are willing to admit men into their berths, and if the men they wish to admit succeed in eluding the eyes of the watchman in charge. The witnesses lay great stress upon the improbability that a man would be allowed to come into a berth in which a number of girls are sleeping together, or that he could effect an entrance without exciting

sufficient remonstrance to attract the watchman's notice. This assumes, however, two things, which it is scarcely safe to take as certain. One is that, in the emigrant class, a well-conducted girl will have the courage to remonstrate with those less decently-minded than herself. She has to live with these girls during the voyage, and she may not wish to make them her enemies; or, as Miss O'BRIEN points out, she may be afraid that if she tries to expose them they will accuse her of being herself the sinner. The other assumption is that the watchman will always be on the side of morality. What seems to be needed by way of safeguard is either so complete a separation between the sexes as to make the presence of a man near the single women's quarters at night a cause of instant and inevitable remark, or the association of the single women with the married women who have no children, or the presence in the girls' quarters of a respectable woman as matron. This last precaution is recommended by Mr. CHAMBERLAIN in his Minute, though not, we think, with as much vigour as the case demands. The Board, he says, "are disposed to agree with Miss O'BRIEN that every emigrant ship carrying a certain number of single women should have a woman of character and experience in the position of a matron." We should go a good deal further than this, and insist upon the presence of a qualified matron in every emigrant ship, unless the arrangements for the separation of the sexes are such as to leave her, so far as the enforcement of decency is concerned, with nothing to do. It is of great importance that no possible suspicion should attach to emigrant ships, because anything of the kind is certain to be made use of by that party in Ireland which is anxious for political reasons to discredit and discourage emigration. That Miss O'BRIEN's attention was first directed to the subject by some one with this intention is not impossible; but if so, this is only an additional proof of the necessity of not giving her any opportunity of saying that her recommendations have been neglected.

#### THE INTERNATIONAL MEDICAL CONGRESS.

THE Seventh Session of the International Medical Congress has just been held in London, under the presidency of Sir James Paget. The meeting was opened in St. James's Great Hall on Wednesday, August 3rd, and was brought to a close in the same place on August 9th. This Congress will doubtless be memorable for many reasons; but amongst them one already stands out with sufficient prominence. Whilst ranking second to none of those which have preceded it in regard to the importance of the subjects discussed at its general and sectional meetings, it far surpasses all others, and indeed any other previous meeting of medical men, if we have regard to the mere numbers of those who were present and have enrolled themselves as members of the Congress. The list has included a total of 3,210 members of the medical profession, of whom about one-half have been physicians or surgeons practising in Great Britain; whilst the other half has been composed of like representatives from all the nations of Europe, as well as from the United States, Canada, and other parts of the American continent. Many of these have been delegates specially deputed to attend the meetings of the Congress by their respective Governments, Ministers, or public departments. The importance of such international medical meetings seems, therefore, to be fully recognized, and this has never been more emphatically shown than on the present occasion.

On the occasion of the opening meeting of this seventh session the chair was first taken by the President of the Royal College of Physicians, Sir William Jenner, as chairman *ex officio* of the General Committee, and it was his duty to sound the first note of greeting to an audience which filled every corner of the Great Hall. At this time, and indeed subsequently during the whole of the prolonged first meeting, the Prince of Wales and the Crown Prince of Germany were listeners. With them, on the platform, was a large and altogether remarkable group of representative men of all nations, comprising amongst them not a few of the most distinguished living physicians, surgeons, pathologists, and physiologists. The election of officers was followed by a well-delivered and well-received speech from the Prince of Wales, and this by the opening address of the newly-elected President, Sir James Paget. It is almost needless to say that his discourse was clear and impressive; and, although it was not characterized by any notable originality, it was a thoroughly earnest and scholarly address, delivered with peculiar freedom and charm of manner. He dealt in the main with generalities concerning the work of the Congress and the progress of medical science, preferring to leave to others the opportunity of discoursing upon special topics. According to a plan which had been pre-arranged by the Executive Committee, other great general meetings followed on successive days, at which addresses on subjects of importance were delivered by authoritative representatives of different nations.

Of these discourses the first was given by Professor Virchow of Berlin, on "The Value of Pathological Experiment," in which, whilst tracing the progress of medical science, he showed how all the solid foundations of the healing art always have been, and even must be, based upon observation and experiment; he showed, moreover, that in the stage of progress to which we have now attained, experiment is daily becoming of more and more importance. Inasmuch as the object of medical science is the prevention and alleviation of disease with all its concomitant sufferings, Professor Virchow did not hesitate to counsel the continuance of careful experimentation by competent workers on the lower animals, in order that man as well as multitudes of these lower animals might reap the great gain likely to accrue therefrom. He held, in short, that the causing of a minimum amount of suffering on the part of some animals was more than warrantable in face of the great prospective good likely to accrue to the science of medicine, and through it to the human race as well as to the brute creation itself. The causing of some amount of suffering was, he contended, an evil less than that of loss of life to lower animals as it would be to ourselves; yet, strange to say, those who would curb or completely stop the lesser evil, when its ultimate aim is the universal alleviation of misery and disease, take no adequate cognizance of it so long as the aim of those who inflict far greater and more widespread suffering or death is "sport," gain, or the gratification of mere animal appetite. For the sake of these popular aims, suffering may be inflicted at will upon animals by the most careless and unthinking members of the community; but should the object be knowledge, with all its ultimate advantages, and should such knowledge be sought for by educated men, then the infliction of any amount of such suffering, however trivial, must be fenced round by penal enactments, and conducted under police supervision. That the existence of such a state of things should arouse wonder in Professor Virchow is not surprising. No one is more capable of judging than this veteran pathologist and statesman what are the advantages likely to accrue from pathological experiments, carefully conducted by proper persons, upon some of the lower animals. And the fact that at the concluding meeting of the Congress a resolution was unanimously adopted embodying very similar sentiments shows that his view is not the opinion merely of a medical philosopher, however eminent, but that it is the common and almost united opinion of a profession ever famous for its charity, as it has been notable above all others for its knowledge of and love of nature generally, and of the animal world in particular.

Another of the general addresses was delivered by M. Pasteur, the famous French chemist, who, in continuation of his researches on the germ theory of fermentation, has of late been occupied with certain highly important experimental investigations touching the nature and mode of propagation of certain epidemic diseases amongst lower animals. Speaking in French, M. Pasteur described in particular the efforts which he has recently been making, and the mode of experimentation adopted, in order to minimize the virulence of two diseases which he believes to be spread, and in that sense to be caused, by the agency of organized germs acting as contagious particles. The two animal diseases which he has been endeavouring, with so much success, to diminish, through the agency of experiment upon other animals, are a species of cholera, very prevalent and very fatal amongst fowls, and also the enormously destructive disease of horned cattle known as *charbon*, splenic fever, or Siberian pest. Strangely enough, too, M. Pasteur has been successfully striving against these fatal animal epidemics by the extension of a method almost precisely analogous to vaccination—a process or mode of mitigating disease which, like experiment upon animals, is hotly opposed by certain persons in this country. By carefully devised methods, the virulence of the contagious elements of these diseases can be diminished and regulated to a nicety, as M. Pasteur has found by preliminary experiments on animals. Taking these contagious elements of the respective diseases whose virulence has been attenuated to a suitable degree, he finds that, if other representatives of the animals in question are inoculated with them, he thereby produces a mere mild and temporary disturbance of health. Nevertheless such animals are henceforth for a time proof against the severe epidemic disease taken in the ordinary way (or even against its contagion when actually inoculated), just as persons who have been vaccinated are for a time proof against the more powerful and fatal virus of small-pox. Concerning the process for mitigating the severity of splenic fever, the losses of animal life from which are so enormous in many countries, M. Pasteur said:—

The method I have just explained of obtaining the vaccine of splenic fever was no sooner made known than it was very extensively employed to prevent the splenic affliction. In France we lose every year by splenic fever animals of the value of 20,000,000 francs. I was asked to give a public demonstration of the results already mentioned. This experiment I may relate in a few words. Fifty sheep were placed at my disposition, of which twenty-five were vaccinated—[i.e. inoculated with an attenuated virus]. A fortnight afterwards the fifty sheep were inoculated with the most virulent anthracoid miasma [unattenuated virus]. The twenty-five vaccinated sheep resisted the infection; the twenty-five unvaccinated died of splenic fever within fifty hours. Since that time my energies have been taxed to meet the demands of farmers for supplies of this vaccine. In the space of fifteen days we have vaccinated in the departments surrounding Paris more than 20,000 sheep and a large number of cattle and horses.

The bearing of these experiments is twofold. They afford a new and unexpected testimony to the value of vaccination as a

process applicable, perhaps, to many other epidemic diseases. The timony like this, coming from without, will, it is to be hoped, cause some of those who, in face of much evidence to the contrary, throw doubts upon the efficacy of vaccination, to reconsider the basis of their opinions. M. Pasteur added:—

If I were not pressed for time, I should bring to your notice two other kinds of virus attenuated by similar means. These experiments will be communicated by-and-by to the public. I cannot conclude, gentlemen, without expressing the great pleasure I feel at the thought that it is as a member of an International Medical Congress assembled in England that I make known the most recent results of vaccination upon a disease more terrible, perhaps, for domestic animals than small-pox is for man. I have given to vaccination an extension which science, I hope, will accept as a homage paid to the merit and to the immense services rendered by one of the greatest men of England, Jenner.

An address prepared by the late Professor Maurice Raynaud, of Paris, had unfortunately to be read by his friend, Dr. Férrol. Its subject was "Le Scepticisme en Médecine au temps passé et au temps présent"; but its gifted author had in the interval between its preparation and the time of its delivery prematurely passed away from amongst us. A similar deplorable gap was made by the decease of Dean Stanley, who had arranged to preach before the Congress on Sunday last in Westminster Abbey. Of the other general addresses one on "Our Medical Literature" was delivered by Dr. Billings, of Washington, U.S.; one by Professor Volkmann, of Halle, "Ueber Moderne Chirurgie"; and the last at the closing meeting of the Congress by Professor Huxley, on "The Connexion of the Biological Sciences with Medicine." These were all of them notable and valuable discourses, affording much food for reflection, by men eminently well qualified to deal with their several subjects. And yet all this was little more than the mere outside fringe of the real work of the Congress, which was conducted daily in sixteen sections.

In these sectional meetings, 119 in all, some valuable presidential addresses were delivered, papers were read, and discussions were carried on in English, French, and German. It was here more especially that the workers and thinkers of different countries came together to compare their views and become personally acquainted with one another. Of the multitudinous and varied subjects which have come under discussion at the Congress some faint notion may be gathered from the fact that the mere abstracts of the written communications printed in the three official languages of the Congress constitute a large imperial octavo volume in small type of more than 700 pages.

The communications that have been made and discussions which have taken place will doubtless add something to the sum-total of general medical knowledge, and it is only fair to assume that they will form the starting points for fresh investigations and inquiries, partly by the same workers and partly by those who amidst this strife of tongues have had their energies kindled in this or that direction, and who will now disperse to many lands imbued with the firm desire to solve one or other of the innumerable questions which the discussions have shown to be still open. It is impossible with any approach to accuracy to gauge the actual amount of good which is to be got from the bringing together in this fashion in Congresses of multitudes of men actuated by common aims. Probably the good that will accrue will be in direct proportion to the amount of earnestness which the persons composing the Congress habitually throw into their daily work. There are Congresses, doubtless, which lead to little in the way of any beneficial results, but there are others of which the usefulness is unquestionable, quite apart from the obvious advantage that fellow-workers in different countries should come to know one another personally by being brought face to face. Science should, in regard to its own work, take slight cognizance of geographical divisions. Its votaries are members of one great family, whose supreme end and aim should be the acquisition of truth and the furtherance of all natural knowledge. And how deeply and widely the roots of the science of medicine ought to permeate the soil of natural knowledge, if those who practise it would see it advance even more in the future than it has done in the past, may be gathered by all who will attentively study the luminous addresses of Professors Huxley and Virchow, which are in some respects closely related to one another in their teachings.

#### THE PARLIAMENT OF THE FUTURE.

EVERY one, of course, regrets that Mr. Bradlaugh, by his own silly and vulgar violence, should have brought upon himself somewhat severe bodily retribution. That if you play at bowls you must expect to meet with rubbers is one of the profoundest expressions of the wisdom of those ancestors of ours who would have made such uncommonly short work of the elect of Northampton. And it is perhaps salutary that tribunes of the people should be taught that what Mr. D'Eyncourt calls assaults by arrangement are ticklish things to carry out in a too vivacious manner. Still, however little the object of sympathy in this particular case may deserve it, it is at least decent and generous to accord him an expression of it. Mr. Bradlaugh's sufferings, moreover, have not prevented him from being extremely vocal, and have still less prevented his supporters and substitutes from lifting up their sweet voices. Mr. Bradlaugh's address to his con-

attendants at Northampton before he retired to his bed of sickness was an excellent specimen of what may be called the "question-and-answer," the "I-pause-for-a-reply," or, to put it more shortly, the Ohadband style of oratory. Was he member for Northampton or was he not? Should he have waited longer before asserting his position? Had he lost any friends by his conduct? &c. Uneducated audiences always delight in this sort of thing. It gives a pleasant feeling of being somehow or other speakers themselves, and reminds them of the music-hall delights of chorus and repartee, in which most of them probably recognize their highest ideal of intense and yet rational enjoyment. Given a tolerably friendly audience of a low class, there is nothing more effective than the question-and-answer style; though it must be admitted that the literary result, when the oratory appears in the blighting black and white of the newspaper, is a good deal less satisfactory than that of some more finished varieties of eloquence.

Mr. Bradlaugh's fire, however, altogether paled before that of his faithful and feminine aide-de-camp and coadjutress at the Hall of Science on Sunday night. Mr. Gladstone has a peculiar habit of affecting ignorance when it suits him; and he is reported to have said in the House of Commons on Tuesday night that "he knew nothing of the speech, his studies of oratory not having made him acquainted with it until he saw it on the paper of the House." Accepting this statement as one of fact, and not merely as "meant sarcastic," and intended for the crushing of Mr. Ritchie, it follows that Mr. Gladstone's private secretaries perform their part of lion's providers very imperfectly, or else that he himself is culpably regardless of all newspapers except the Gladstonian portion of the provincial press. The person who has made herself conspicuous in many a hard-fought field at Mr. Bradlaugh's side, who has printed with him the instructive pamphlet, and ably seconded the spirit-stirring speech, was fully equal to the occasion. Charged with the messages of the great leader to his faithful followers, she performed the office in a graceful fashion enough. After a deed so heroic as the throttling of a messenger, it is a little difficult for the hero himself to describe his feats and his merit. Modesty interferes. This has always been felt to be a difficulty by great men, and they have resorted to many ingenious devices to overcome it, the most ingenious of all being that of Sully, who made his secretaries recount his whole career to him in the personal narrative form—"Then your Grace got up, and thus addressed his Majesty"; "at six o'clock in the morning you arose, and with unwearied diligence, journeyed to meet the enemy," &c. &c. An account of Mr. Bradlaugh's *faits et gestes* on that memorable Wednesday, couched in this form, would be not unamusing; but fate and erysipelas prevented the possibility of it on this occasion, and the third instead of the second person had to be used. It appears from the utterances of this Iris of secularism that Mr. Bradlaugh is not going to be so patient next time. The vagueness of this assertion was, it will be seen, considerably defined later on. But, before considering means, the speaker devoted herself to ends. Mr. Bradlaugh, it seems, is not only going to enter the House, but he is going to enter it as a master. He is not going to show the slightest forgiveness. Everything connected with his exclusion from the House is to be formally expunged. All the Liberal members who voted against him are to be turned out of their seats. Mr. Bradlaugh himself is going to contest twenty or thirty constituencies—an enterprising proceeding, which, let it be observed parenthetically, would probably result in Conservatives being elected for every one. Something dreadful is to be done to the Speaker, but what is not very clear. The oratress, however, threw some light on the question by observing that, "if she had known what was going on, she would have let their supporters go and show Mr. Brand something of the same sort that his mob were showing to a member of Parliament." That is to say, this mild-minded person would have hustled Mr. Brand, and turned him out of the House of Commons. But the most practical part of the discourse has not yet been noticed. "She advised them to make a good use of their time"; "a little drilling would not be bad for them"; "they would do well to join Volunteer regiments, and take advantage of the drilling and the training"; "the only way to get justice was to fight for it; they could not get it by law, they could not get it by fair play, but they could get it by force." This method of political argument, moreover, is, it seems, to be continued when Mr. Bradlaugh has got into the House. The struggle is not to be over when that auspicious event has taken place. This latter utterance lapses once more into the obscure, and is only illustrated by a liberal offer to Mr. Bright. "If John Bright wished to be Prime Minister of England, he had only got to say so." But the measures to be accomplished when Mr. Bright is Prime Minister, Mr. Bradlaugh "master of the House of Commons" (a title for which we have a great affection, inasmuch as it admirably expresses the aspirations and character of the new democracy), and the brisk boys of the Hall of Science, armed, drilled, and ready as a bodyguard, remain to be explained.

It is, of course, very easy to adopt Mr. Gladstone's line and dismiss these utterances as the idle ravings of an angry woman. Whether it is wise to do so is not so clear. Although the audience which cheered this person's words has been no doubt grossly exaggerated, as all the attendances at Mr. Bradlaugh's meetings are exaggerated, there is no doubt at all that a considerable number of persons did applaud the recommendations to drill, the assertion that force was necessary, the regret expressed that the Speaker had not been assaulted. A similar

tone prevailed at the Northampton meeting, though it was not so openly encouraged by Mr. Bradlaugh. It is notorious, moreover, that Mr. Bradlaugh's roughs were last week quite ready to have used force; indeed, every observer momentarily expected a collision. Of such a collision there could of course only be one end. Mr. Bradlaugh's lambs are relatively an insignificant body; and though the patronage of apparently respectable Radicals and Radical newspapers has for the moment swelled their numbers, it is exceedingly improbable that the new adherents would go the lengths of Saturday's address. Silly clergymen may write to Mr. Bradlaugh (at the very time that his noisy supporters are shouting contempt and execration of his enemies as "Christians") to the effect that they are ashamed of the violence to which he has been subjected; impulsive Cabinet Ministers may pat him on the back; nervous people, who prefer a quiet life to anything else, may wish to admit him and have done with it. These are not the classes who will join him in executing a new purge of the House of Commons and tearing the obnoxious Minutes out of the journals. But that he has a certain number of adherents is certain; that those adherents are foolish enough and criminal enough to risk a riot is probable; that they are much encouraged by the success of violence in Ireland is only natural. Mr. Gladstone's famous Midlothian speech has stamped the recipe for attaining political objects. With him, therefore, force is an argument, just as with his colleague force is no remedy. It is inevitable that the two lessons should be applied together as meaning that force may be applied by malcontents, and must not be retorted by Government. Even in this very case the orator of the Hall of Science may claim that her threats and the violence of her coadjutor have succeeded. It is said that the Government—the Sessional Orders excluding Mr. Bradlaugh having lapsed at the conclusion of this Session—will, at the beginning of the next, move that he be allowed to take his seat; and, in the event of that motion being defeated, will bring in a relieving Bill. That is to say, instead of saying to Mr. Bradlaugh, "Your conduct has put you out of court; and, until you formally apologize to the House of Commons, and submit to its authority, you are, and shall remain, an extraneous person," they will acknowledge the success of his bullying, grant him all he asks for, and virtually fulfil his friend's boast that he will enter Parliament as master.

We find it, we confess, absolutely impossible to conceive a proceeding *per joris exempli* than this; for even on the enormous assumption that Mr. Bradlaugh's case were a good case, he has put himself completely in the wrong by the unseemly violence of his recent conduct. There could hardly be a richer example of inconsistent absurdity than Mr. Bright's speech in the House of Commons of Wednesday, and his speech at the Mansion House on Saturday in last week. On the latter occasion, after an elaborate account of the way in which Ministers are going to pull the House of Commons to pieces and reconstruct it again, the Chancellor of the Duchy of Lancaster suddenly remarked that the most important thing of all was that men of a gentlemanlike spirit should be returned to the House. This is a sentiment in which we can all heartily agree, though a Bill for the returning to Parliament of none but persons of a gentlemanlike spirit seems a curious effort of legislation. But the definition of a gentlemanlike spirit supplied by the utterances which, according to Mr. Bradlaugh's friends, have placed the Premiership of England at Mr. Bright's disposal whenever he chooses to apply at the Hall of Science, and hear something to his advantage, is far more comic even than this. The particular comes most felicitously to explain the general. Mr. Bright's ruling anxiety is that men of a gentlemanlike spirit should sit in the House; his immediate and most eagerly-backed candidate for such a seat is Mr. Bradlaugh. The picture of the Parliament of the future, which this comparison enables us to draw, is aptly supplemented by the Hall of Science programme. A Premier, a Master of the House of Commons, and a Five Thousand; or any number that may be necessary of armed and drilled roughs, this is what we are to have. Fortunately, whether things have or have not gone from bad to worse for us since 1848, there is no doubt that, putting police and military aside, there is quite enough good sense and patriotism left in London to do with the followers of Mr. Bradlaugh as was done with the followers of Feargus O'Connor. But it is somewhat absurd that the greatest capital of the world should be reduced to this as its most cheering prospect. That the mismanagement and shillyshallying of the Government is altogether to blame for the difficulty in this case there is not the slightest doubt; and, unfortunately, this mismanagement and shillyshallying has come just at the very time when their words of commission and their acts of omission have encouraged a lawless and successful agitation, accompanied by violence, in another part of the United Kingdom. It is scarcely surprising that apparent sympathy with riot should be an encouragement to rioters.

#### THE ABBÉ PRÉVOST.

THE events of the Abbé Prévost's life, though he lived two hundred years ago, have an interest as fresh as if they were of yesterday, it being a question whether, and to what degree, they supplied the materials of his wonderful romance *Manon*

*Lescout.* A brief sketch of his life in connexion with his work will afford the means of judging to what extent one of the most remarkable characters in fiction was an invention or one of those realities which sometimes accidentally serve an author's purpose and make him an undying name.

Antoine François Prévost-d'Exiles was born at Hesdin, in Artois, in 1697. The second of five sons, he was placed at an early age in the hands of the Jesuits, who directed the college there. He showed signs of remarkable precocity; but, soon tiring of a life of seclusion, entered the army at the age of sixteen. No sooner had he tasted the severity of a soldier's life than he yearned for the quiet of retirement in which to indulge his great love of reading, so his thoughts again turned to the Jesuits he had deserted. They received him without a rebuke, but it was not long before he again quitted the college, his buoyant spirit once more asserting itself among his companions of the cloister. His new impulse was for military glory, and he again embraced the profession of arms. Now, foreseeing a breach with his family, he determined never to see them again. He soon became a favourite in his regiment, and catching the reckless spirit of his companions, threw himself into a life of dissipation and intrigue. After a long spell of extravagant excesses, he sank into a state of deep melancholy, and, doffing his uniform, sought refuge among the Benedictines of St.-Maur, keeping the consecration of his vows a secret from the world until all the usual forms had been completed. Proving himself to possess a mind of no ordinary calibre, he was selected as *prédicateur* at Amiens. Here his eloquence gained him great favour among those who heard his sermons, and when he left for St.-Germain-des-Prés in Paris, the regret among the townsfolk was universal. Here he assisted the monks in compiling many learned works, and it was his habit after the labours of the day to recount his various adventures, as soldier and student, to the brotherhood; during his sojourn here, too, he wrote the first two volumes of his *Mémoires d'un homme de qualité*, a work never to be forgotten on account of the marvellous story which later on it embodied. While relating the scenes of his youth, the Abbé Prévost was perhaps again visited by a longing for the freedom he had formerly enjoyed; he soon asked permission to be moved to a less strict college, and before the reply arrived, took his flight into Holland, where, among the French refugees who were at that time so numerous, he managed to get a living, and where he continued the "*Mémoires*" he had begun. During his six years' stay in Holland, he formed the acquaintance of a young governess whom he assisted, and who followed him to England. In London he wrote *Cléveland*, the best criticism on which is to be found in Xavier de Maistre's *Voyage autour de ma chambre*. "How many times," he says, "have I not cursed that Cléveland who is for ever embarking on new misfortunes which he could always avoid. I cannot tolerate this book and this string of calamities; yet if I open it, I find myself forced to devour it to the end." It was also in London that Prévost introduced into the *Mémoires d'un homme de qualité* Manon Lescout—a work unique in all literature, and on which we must pause.

How few are there among us who have not read *Manon Lescout*, and how many who know that this touching picture of a struggle between principle and passion is a history more than a romance, that it is an episode in the early life of its author, the Abbé Prévost? Many readers, while following the adventures of Manon and the Chevalier des Grieux, must have put down this remarkable book to stop and ask themselves, Is it a romance from the author's brain, or did these two beings, whose story has moved us so deeply, live, and, if so, who were they? The first meeting of Manon and the Chevalier des Grieux, the one on her way to the cloister, the other to the monastery; then a short spell of happiness in Paris; the violent separation of these ardent lovers, when the mysterious M. de B., in order to steal away the young man's mistress, sends him a prodigal home to his father; the Chevalier's repentance and entrance into holy orders; again his desertion of the Church for the world, when the guilty Manon falls weeping at his feet in St. Sulpice; then his adventures in gambling-houses with Manon's dissolute brother, who, recognizing Des Grieux as his sister's lover, lives on the revenues of her beauty; the tragic end of Lescout; the prison escape of the lovers; their last journey among criminals to America; Manon's death in the desert; and her burial, with her faithful lover Des Grieux, her grave-digger and her sole mourner—are these scenes from the life of the Abbé Prévost drawn from sad memory when he wrote this singular book, an exile in London? The chronicles and correspondence of the time make it almost certain that many of the situations and characters are founded on fact; but the latter portion of the story, in which is painted the pathetic end of Manon, though possible, is not likely to have actually happened, but rather to be what Prévost conceived ought to have happened, just as, in the *Reine de Galconde*, Boufflers gives us a true account of his early romance with the milkmaid, Aline, and, where truth ends, follows his heroine through imaginary scenes which, as a natural climax, might have taken place.

*Manon Lescout*, which forms only an episode in the *Mémoires d'un homme de qualité*, was written between 1728 and 1731. The period which its pages depict so vividly, yet with no apparent effort, is that of the Regency, when the Government, unable to restrain the rage for gaming it had itself initiated through the enterprises of Law, at last surrendered a licence to certain *maisons de jeu*. In this state of things Lescout, Manon's brother, was the

typical card-sharper of the time; and the scenes through which he led his victim, Des Grieux, illustrate the life of that day. It has now been decided, almost beyond doubt, that the M. de B. above alluded to was no other than M. de Bellegarde, a *fermier-général*, living at one time during the Regency in the Rue Louis-le-Grand, at another in the Rue Saint-Honoré, both of which are near the Rue V. (Vivienne), where the lovers resided, and which was the favourite field for gallantry and play. As regards the lovers, Manon can hardly have been anything but some heroine of the Abbé's own adventures; while Des Grieux and Tiberge were the erring Prévost himself. That Prévost in fiction should have sent Manon to Louisiana appears natural if we study the ways of the time. During this period the prisons were crowded to excess with criminals of both sexes; and the new colony, on the other hand, was crying out for emigrants, especially women. The chroniclers give accounts of carts crowded with prisoners on their way to Havre or Rochelle to be shipped for America. Among these writings, perhaps the most interesting is Buvat's *Journal de la Régence*. Take, for instance, the following passage:—"On the morning of the 18th of September, 1719, one hundred and eighty young girls were married to as many lads at the church of the Priory of Saint-Martin-des-Champs in Paris; they were taken from the prison of this Priory and from other prisons of the town, these poor creatures being left free to choose their husbands among a still larger number of youths. After the ceremony they were sent away in pairs, joined one to the other with a little chain, and followed by three waggons filled with their clothes, and escorted by twenty archers to conduct them to Rochelle, thence to be transported to the Mississippi, in the hope of better fortune." Again:—"On the 18th of October in the same year thirty waggons were despatched from the city, filled with women tricked out in the oddest fashion, with an equal number of lads who followed on foot. The women, while passing through Paris, sang as though they had known no care, and shouted to those of their acquaintance to accompany them on their voyage. There are many other examples of a like kind; in fact, these consignments of vagabonds became so numerous that it was found necessary to form a special corps of archers for their escort to the coast." There is no need to dwell on a subject so painful, but we may add that, after comparing the reality with the fiction—the picture of Manon in the waggon among her fellow-offenders and the young Chevalier des Grieux following her in tears till he has spent his last livre in bribing the stern guards to allow him to accompany his mistress—the account has, at any rate, the merit of being founded on what was passing in that day, whether it formed part of the author's experience or not. We may take then the whole of this singular story to be more or less true up to the point where the lovers embark for the colony; but the touching end is not less beautiful than the rest, because it carries with it the hero's desire to place his mistress beyond the censure of the world.

A story is told of the Abbé Prévost, when in later years crossing the Pont Neuf in company with a lady, seeing a familiar figure flit by him, and on turning recognizing in it a phantom of the past—Manon; another of his finding her among a group of brawlers in a wine-shop, so changed a Manon that all remembrance had gone from her of old days.

Through the influence of the Prince de Conti and Cardinal de Bissy, the Abbé Prévost, who had been exiled, was permitted to return to France, and, at the request of Chancellor d'Aguesseau, he translated a collection of voyages which had been brought out by a number of English writers. Taking up his abode near Chantilly, he devoted himself exclusively to study. His death took place under painful circumstances in November 1763. While crossing the forest he was seized with a fit of apoplexy, which proved fatal in consequence of the ignorance of a surgeon.

Prévost was a most voluminous author. Besides his original writings he translated *Pamela*, *Clarissa Harlowe*, *Grandison*, and *Hume's History*. And what Sainte-Beuve has said is worth remembering—namely, that the more one reads *Manon Lescout*, the more all of it seems real—true from that truth which has nothing of invention about it, and which is all copied from nature. If any art is present, it is impossible for the reader to feel where reality ceases and romance begins. It has been said to be difficult to understand how it was that the Abbé Prévost could conceive the idea of such a history. The fact is that he had no idea; he had an experience, he felt it, and he told its story. His gift of expression is so fluent and simple that it is difficult to describe it, except by saying that, *par excellence*, he has no style. *Manon Lescout* has been a good deal decried by some critics; and she has given birth to a deplorable progeny. But her history was the first example of the modern novel, and not many of its successors have surpassed it in poetical and narrative power.

#### THE PAPAL ALLOCATION ON THE LAW OF GUARANTEES.

THE full text of the recent Papal Allocation on the unseemly disturbance which occurred at the removal of the body of Pius IX. to San Lorenzo on the night of July 12 has just been published, and it entirely confirms what had been already reported or rumoured as to the attitude of Leo XIII. and the supreme wisdom of the conduct of the Italian Government. This last point has,

indeed, since received a further illustration in connexion with the meeting held last Sunday in the Politeama Theatre at Rome to protest against the Law of Guarantees, a report of which appeared in the papers on the same day with the text of the Allocution. And before speaking of the latter document a few words on the incidents of the meeting will not be out of place. The Government was of course as well aware beforehand of the intention to hold it as our own Government were of Mr. Bradlaugh's intention to hold his meeting in Trafalgar Square on Tuesday week, and their manner of dealing with it was at least equally infelicitous. As the Law of Guarantees is one which they profess themselves so entirely unable to repeal that it is unlawful even to propose its abolition, common sense would have suggested that they should prohibit a meeting held for the avowed purpose of "inciting to a violation of the law." And if it was allowed to be held at all, one hardly sees why its conductors should not have been suffered to carry out undisturbed the programme previously announced. This, however, was not the view of the Government, who appear to have had neither the courage to prohibit what they considered unlawful nor the consistency to permit what was not forbidden. By a singular compromise the meeting was left unchallenged, but the handbills announcing it were suppressed. This ingenious method of blowing hot and cold may have served somewhat to diminish the numbers present, but did not certainly moderate their tone. About three thousand persons met on Sunday morning in the theatre, among whom were the two sons of Garibaldi. Signor Petroni, described as a patriot of the old school, who had spent eighteen years in prison for political offences, presided, and opened the proceedings with the conciliatory announcement that "his true martyrdom began when he was released from prison, to find a new régime guaranteeing corruption instead of liberty." A telegram from Garibaldi was then read, "expressing his wish for the abolition of guarantees and guaranteed." The precise meaning of the words we have italicized seems a little ambiguous; they may either refer to the abolition of the Papacy or the lynching of Leo XIII., or indeed both suggestions may not improbably be intended to be combined. The next speaker, Signor Bacci, was at all events sufficiently explicit as to the first point. "Rome," he said, "to-day protested against this law, declaring in unison that the democracy of the civilized world did not want Papacy, which barred the march of humanity in the path of eternal progress." Signor Mario, who followed him, if he was not more explicit, entered more fully into personal details. After reading a summary of the Papal Guarantees "amid hisses, laughter, and groans," he proceeded "to sketch, in a hostile spirit, the history of Christianity and Catholicism"; and then, "coming down to the present Pope, whom he styled Signor Pecci, said that the last Allocution indicated that he meditated flight [it implies just the reverse]. If so, they would wish him Godspeed." Up to this point, though the language appears, from all accounts, to have been tolerably violent, there was no official interference. But when Signor Lemmi began to read the resolution, for passing which the meeting had been summoned, declaring that the Roman people demand the abolition of the Guarantees and the occupation of the Papal palaces, this was held to be "an incitement to violate the law," and three police delegates present at once donned their tricoloured sashes and interrupted the speaker, whereupon "an indescribable hubbub ensued, lasting for a quarter of an hour, till the delegates pocketed their sashes." The dignity of the law having been vindicated in this very effectual manner, Signor Parboni mounted a chair, and read the forbidden motion "with a voice like Mars," and, in spite of a second interruption of the police, it was carried amid deafening cheers, and the meeting instantly dispersed, before the police could close it. On the following day several Liberal newspapers, as well as the *Osservatore Romano*, the Vatican organ, were sequestered for printing the incriminated resolution and the speech of Signor Mario, which "contained offensive allusions to the Pope." But the meeting was expressly summoned in order to pass this unlawful resolution, and if the Government expected it to be proposed and advocated without any "offensive allusions," their confidence in Liberal inconsistency must be great indeed. As to the bearings of the whole affair on the growth of that ultramontane spirit, which it must be the aim of any rational Italian ministry to exorcise or render innocuous, we can only say, *Huc Ithacus velit, et magno mercentur Atride*. The Italian Government have done their best to make themselves ridiculous, and to forge fresh weapons for the hands of their most inveterate foes.

Among these foes we do not reckon Leo XIII. The language of his last Allocution, if we allow for the somewhat stilted formalisms which inevitably reappear in all papal manifestoes, fully bears out what had been previously asserted by those most likely to be well informed. There can be little doubt that, whatever further reasons there may have been for the translation of the remains of Pius IX. from St. Peter's to San Lorenzo, at this particular time, it was intended partly as a feeler, and that, if all had gone off quietly, the living pontiff would have felt able, as he is known to be willing, to consider the propriety of putting an end to his long and wearisome "imprisonment." His annoyance at the folly of the Government, which in defeating this desirable object has played into the hands of the extremist section of Clerical irreconcilables, is rather patent than latent in the comment subjoined to the form of "solemn protest against these deplorable excesses, the certain blame for which falls upon those who did not defend either the rights of religion or the liberty of

the citizens, from the fury of the impious." The Pope significantly adds:—

And from this also the Catholic world may judge what security there is left for us in Rome. It is already well and openly known that we are reduced to a most difficult, and for many reasons intolerable, condition, but the recent facts of which we have spoken have made this more clearly manifest, and together they have demonstrated that if the present state of things is bitter to us, still more bitter is the fear of the future. If the removal of the ashes of Pius IX. gave cause for such unworthy disturbances and such serious tumults, who could give warranty that the audacity of the wicked would not break out into the same excesses when they saw us pass along the streets of Rome in a manner becoming our dignity? And especially if they believed they had just motive because we ourselves, through duty, went to condemn unjust laws decreed here in Rome, or to reprove the wickedness of any other public act. Hence it is more than ever evident that in the present circumstances we cannot remain in Rome otherwise than as a prisoner in the Vatican.

It may be, and probably is, true that some of those who organized the Catholic demonstration, which was made the immediate pretext for this outbreak of indecent violence on the part of the Liberals, wished nothing better than to provoke reprisals, and thus verify their own reiterated declarations of the impossibility of any *modus vivendi* being established between the Papacy and the Italian Kingdom. But we know no reason for assuming that the majority of Catholic mourners were actuated by any other sentiments than what are attributed to them in the Allocution. And even were it otherwise, there can be no doubt as to the mind of the Pontiff himself, who has now officially informed the world—as will be seen from the words italicized in our next extract—that he was careful to take all proper precautions to secure the aid of the Government against any such deplorable contingency as eventually occurred. And the imminent prospect of a rivalry of violence and folly between the *intransigents* on either side should have supplied an additional motive for rendering any breach of the peace impossible. With the probable qualification intimated above, which could not of course be expected to find place in a Papal Allocution, there is no ground for questioning the substantial accuracy of the following account of the circumstances preceding the disturbance:—

As you know, venerable brethren, Pius IX. ordered that his body should be buried in the Basilica of San Lorenzo Fuori le Mura. Wherefore, having to carry his last will into effect, it was, in intelligence with those whose duty it is to guarantee the public security, established that the removal from the Vatican Basilica should be made in the silence of the night and during the hours which are usually the most quiet. Similarly, it was decided that the translation should be made in the manner permitted by the present condition of Rome, instead of in the splendid form proper to the Pontifical Majesty and the traditional usages of the Church. But the news was suddenly spread throughout the city that the Roman people, mindful of the virtues and the benefits bestowed by the great Pontiff, had spontaneously manifested the desire of rendering to their common father the last tribute of respect and filial affection. That manifestation of gratitude and affection was intended to be thoroughly worthy of the gravity and the religious sentiments of the Roman people, who had no other intention than that of associating themselves decorously with the *cortège* and assisting unnumbered and reverently at its passing. On the day and at the hour fixed the *cortège* moved from the Vatican Temple, while a great multitude of persons of all classes crowded from all sides. Many were around the funeral car; very many behind it, and all were of tranquil and serious bearing. Intent on reciting the fitting prayers, they neither uttered a cry nor committed an act which could provoke any one or give cause in any way for disturbances.

It is especially unfortunate that just at this moment any fresh occasion should have been given to the Pope for thinking, or for letting it be supposed he thinks, that "more pernicious intentions are being matured to the injury of the religion of Christ, of the Supreme Pontiff, and of the hereditary faith of the Roman people." For there is good reason to believe that, in arranging for the peaceful removal of the body of his predecessor, Leo XIII. was only carrying out one part of a general programme, adopted with the view of at least testing the possibility of coming to some permanent understanding with the Italian Government. A pamphlet on the present situation has lately appeared at Rome, published anonymously, but pretty well understood to be drawn up under papal inspiration, in which a scheme of this kind is sketched out. All idea of the restoration of the deposed Italian princes is definitely repudiated, nor is any claim put forward for the restoration of the temporal power on its old footing. But the Law of Guarantees is shown to provide an inadequate security, as well because it fails to offer a sufficient provision for the necessary expense of the Papacy, as from its resting on no more permanent basis than the goodwill of the Italian Parliament. The writer accordingly proposes the restoration of a certain limited portion of territory to the Pontiff, and the establishment of a European guarantee. Into the expediency or practicability of the details of the plan suggested there is no need to enter here. The fact that for the first time some proposal of a *modus vivendi* short of a simple return to the *status quo* has emanated from the Vatican side is in itself noteworthy, and might surely have been expected to elicit a friendly response rather than a rude repulse on the part of the Government. Moreover, if the suicidal policy of Pius IX. is to be abandoned, and Catholics are allowed to go to the polling-booths in Italy, which is also recommended in this pamphlet, as well as in Father Curci's last brochure, the relative position of parties in the Parliament would most likely be materially altered, and that is a contingency it behoves the Cabinet to bear in mind. The rumour referred to by Signor Mario, and which has since found expression in the ministerial *Diritto*, that the Pope intends leaving Rome, sounds very improbable, and receives less than no countenance from the language of his last

Allocution, though some critics profess to "read it between the lines" of a studiously vague menace in Cardinal Jacobini's recent circular to the foreign nuncios. Such an interpretation of language diplomatically obscure is, to say the least, gratuitous and premature. Such a step would be likely to cause greater embarrassment to his friends than to his enemies, and Leo XIII. is the last man to desire to be brought back to Rome, like his predecessor—given were such an intervention less improbable that it is—on the shoulders of some foreign party of order. Neither interest nor duty—and he has a keen sense of both requirements—would counsel a desertion of his post. Martyrdom at the hands of the Garibaldians is, after all, not a contingency to be seriously apprehended, nor would such a crime be chiefly detrimental to the Papal cause. In a criticism on the pamphlet already mentioned, published in the *British Quarterly*, Mr. Adolphus Trollope gives us a conjectural computation of the social forces in Italy that make for and against the Papacy, though he confesses himself unable to gauge the real strength of the former with any certainty. That a crisis of some kind is approaching appears to be very generally believed, and wise men of all parties—among whom we do not include revolutionists of the type of Signor Mario and Signor Petroni—must desire that the opportunity afforded by such a pontificate as the present for the establishment at least of a satisfactory *modus vivendi*, if nothing further can yet be accomplished, should not be thrown away. The meeting of Sunday last, and the outrage which preceded it, would not in themselves afford any substantial ground for disquiet, but it is much to be regretted, in view of the gravity of the situation, that the Government should manifest so feeble a sense of their responsibilities.

#### SOCIETY AT SPA.

WHEN once the London season has come to an end, society feels sadly at a loss what to do with itself until the next notable division of its year—the shooting season—begins. As the invitations to dances and dinners become fewer and further between, mammas get more and more anxious as to where they are to bestow themselves and their fair beavies of daughters until the country-house visiting begins. Of course there is the "Cowes week," where yachting and sea-side costumes may be displayed to the best advantage. But that is short and soon over; and then, for those unfortunates who are not lucky enough to have a moor in Scotland of their own, or to be asked to share the delights of another's, there, appears a dismal prospect of several blank weeks which fill them with utter despair. It then usually occurs to them that their health is in a very precarious state. In this depressing conviction the family doctor confirms and strengthens them, and assures them that the only hope of prolonging their existence lies in going through a complete course of mineral waters. Such waters are to be found in plenty within our own island. In a past day the fashionable world flocked to Buxton, Bath, or Tonbridge Wells. But their virtues are now ignored. So likewise is the fact that the waters of almost any mineral spring in the world may be had of every respectable chemist, and imbibed in any given quantity at home. That the springs to be sought after should be on foreign soil is one of the essential conditions of the cure. The arguments for and against all the French "eaux" and German "bads" have to be carefully weighed. At last it is decided to try one that is neither French nor German, but whose reputation is older than any of them. This is the Belgian Spa, whose name has been so largely borrowed in all sorts of places that the ignorant imagine it to be a common noun, signifying simply a well of foul-tasting waters. Frequenters of the original Spa sing its praises loudly, and exalt it far above the heads of all imitators and rivals. The waters are strong; the scenery beautiful; the hotel accommodation excellent; and the society select. No fear of invasion from the vulgar herd of compatriots that throng Homburg or Wiesbaden. No risk of having your digestion destroyed by the masterpieces of German cooks or your nerves unstrung by witnessing the daily performance of the knife trick by German gluttons.

Judging by the map, Spa is one of the most get-at-able of places. It lies very near the main line from Brussels to Cologne. But there is a branch line to be got upon before you quite reach it. And the express is in such a hurry to get on its way that, when the cry of "Pepinster," the name of the junction, is raised, Spa-bound wayfarers have barely time to scramble out with bags and bundles upon the platform before the train is whirling off into the darkness, carrying with it some poor victims who have not been sufficiently on the alert, and who will have to pass the night as they best can at the next stopping-place. Meanwhile, the lucky traveller who has reached Spa in safety, but at near midnight, and who, being a methodical person, has ordered his rooms beforehand, finds to his dismay that all his luggage, though registered for Spa, has been detained at the Custom-house at Liège, and that thither he must repair in person on the following day to claim it, and have it examined before he can expect to get a shred of it. Having made a raid for and brought back in triumph his own property, he proceeds to inquire into the capabilities of the place, and to find out what the visitors do with themselves when they are not steeping in hot or imbibing cold water. The situation, the middle of the Ardennes, sounds romantic and picturesque enough. But the far-famed wood has been shorn of its finest trees, round Spa at any rate, and is now a forest in the original meaning of the word only—that is, a tract of waste land here and there covered with

scrub. The hills around, too, though known as the Highlands in Belgium, are about as Alpine in their character as the Seven Hills of Rome. The town lies in a narrow valley, and consists almost entirely of hotels, pensions, and lodging-houses, grouped round the Trink-Halle, which encloses the Pouhon, the principal spring. The main street is filled with shops for the sale of every imaginable perfectly useless article made of the painted wood known as Spa-ware. Visitors delight to deck themselves with the horribly natural effigies of bees, wasps, spiders, and all manner of noxious insects of the said ware in guise of ornaments, though, if the same creatures were to come within a yard of them in bodily form, it would send them into hysterics. Besides the central spring, there are four others, which lie at intervals half way up the low hills that enclose the valley. The Tour des Sources is the drive off the place; but, as it is only between two or three miles round, that is soon over. Then there are the public gardens. This dignified name is applied to a rather damp avenue where a brass band hoots for an hour or so every afternoon and evening. To its strains a vast deal of gossip is retailed, and many a malicious story of the London season's triumphs and defeats is here invented for the first time. From the Casino the glory has departed with the gambling tables. The ball-room is opened, and a band performs dance music on certain evenings, and this ranks as a ball among the catalogued attractions of the place. A few people go to look at the dancing, but somehow the dancing never comes off; for, as the company are mostly English, who are too shy or too much on their dignity to yield to any *Invitation à la valse*, be it ever so inspiring, the entertainment resolves into a stiff promenade of would-be sightseers with no sight to see.

The surrounding country has not much to offer in the way of rides and drives. An attempt may be made to get up a little historical excitement about the ruins of Franchimont, a castle introduced in *Quentin Durward* as the lair of the arch-robber known as the "Wild Boar of the Ardennes," which lies a few miles off. But the scenery is like history—it repeats itself—and by the time you have got half a mile out of Spa, you have had an epitome of the whole of it. Then the Belgian custom of paving every inch of the high roads with singularly irregular cobblestones makes a drive one perpetual and painful penance.

The physical resources of the place being thus speedily exhausted, the visitor is fain to extend his knowledge of human nature by a careful study of the specimens here collected. For this purpose the Trink-Halle offers the most varied set of subjects. Among its habitués are the Englishman who takes care to let every one know that he has taken lodgings at one of the outlying springs to get away from people, and who yet haunts all day long this spot where people throng thickest, as if he were the ghost of some one who had committed murder on the spot. Even among those who take drinking the waters in a serious way there are all degrees of proficiency, from the unruly children who can only be induced to swallow their dose when it is slaked with "sirops" or sweet wines in quantity sufficient to neutralize any good it might otherwise do them, to the elderly dowager, the prize-drinker, who has achieved the triumph of swallowing daily a larger quantity than any one was ever known to survive before. Some sip their daily potion slowly through the orthodox glass tubes with which every drinker arms himself, making believe very hard that they enjoy it immensely. Few express their minds so naively as an old French priest, who raised his glass to his lips with eyes as sparkling as its contents, evidently anticipating a draught akin to nectar, but set it down, exclaiming angrily, "Well, for my part, I prefer plain water. My God, to think that I should have come so far only to taste so vile a fluid!" and strode out of the place, casting an angry glance on every one within eyeshot, as though they had all been trying to impose upon him grossly.

But the *vie intime* of the world that frequents these waters is best studied here, as elsewhere, at the table-d'hôte. This ceremony takes place at Spa, as everywhere throughout the Netherlands, at the unhallowed hour of five. With much grumbling the guests have to accommodate themselves to this uncivilized practice of substituting a heavy and long-drawn meal for their customary cup of tea. By the time they have regulated their appetites to suit this eccentric hour, they move off to some German Bad, and have to go through a new course of training to fit in with the full feed at midday which the Vaterland still clings to. The first thing that strikes one on a glance down the long table is the scarcity of men. These indefatigable workers very soon find that at Spa there is nothing to do, and that business of the most urgent kind requires their presence elsewhere. So they leave the ladies of their family to carry through their self-imposed penance alone, and go off with light hearts to make the most of a little bachelor freedom while they may. The few men left are uneasy about their own health. Here is a clergyman with a weak throat, who is afraid some one may escape knowing how learned he is. He therefore hurls an historical lecture about Pepin of Herstal and Charles Martel, in their character of local heroes, at the young man opposite him. His poor overgrown youth, evidently a victim of too great a devotion to athletic sports, blushes, and looks uneasy. He has never heard of the worthies in question, but doesn't like to say so, as he suspects his assailant of being an examiner in disguise. This learned person, instead of scattering his pearls in this reckless way before an unworthy object, might find a more congenial spirit closer to him in the Frenchman whose stiff-necked obstinacy and pointed imperial bespeak him a Bonapartist. Unfortunately

neither knows the language of the other, so they cannot exchange volleys of improving talk. The Frenchman's forte is being well informed about everything, especially English matters. *The Song of the Shirt* is, he will tell you, the acknowledged masterpiece of English poetry. He ejaculates over and over again, "O! la chemise! la chemise, c'est adorable!" He has got rather mixed about Tom Hood and Theodore Hook, though, for he believes that the author of these sublime verses is the son of the Bishop of Chichester. Then there is a grimy-looking family who call themselves English, but whose features betray Hebrew descent. They are great favourites in the hotel, for they give no trouble, and have not asked for a bath or a drop of water to wash with since their arrival! One lady, who is attended by husband and family, has achieved a proud pre-eminence by means of a lame leg. She lives in a bath-chair, and sits enthroned therein as on a dais at the dinner-table, looking down with but thinly-veiled contempt on those uninteresting mortals who have no such interesting incapacity to boast of. She requires many supporters to get her up and down stairs, and must have her foot, if not her whole form, carried for her all the way. She has been seen, however, running along the hotel passages as nimbly as those one-footed aborigines whose velocity excited Sir John Mandeville's surprise, and servants and children are getting restive, so that it is possible they may refuse to assist at this little comedy much longer. When that happens the waters will get the credit of the cure.

As the races draw near, horsey men appear on the scene. They have brought horses to run, and try to inveigle you out to the stables to look at their beasts, dwelling proudly on their exploits, in hopes of getting you to back them. The race takes place at the "Hippodrome," on a great stretch of heath a couple of miles off. There are grand stands and a powerful band, and many spectators on foot and in carriages, and every one takes a holiday and goes. Every one tries to feel very interested, and to look as excited as possible. But the show of horseflesh is not brilliant. Some of the races, indeed, are run by the sorry hacks that on working days drag the Flies of the town.

Among the facts which redound most to the glory of Spa, we must not forget to mention that it reckons many royal personages among those who have been marvellously cured by its waters. First and foremost among these was Peter the Great, who came there with health completely shattered by hard drinking. He was ordered strict abstinence from any beverage, save Spa water. So he rode an ass daily to one of the springs on the hills. There he took the water in about the same proportion to wine as Falstaff's bread, always insisting on several bottles of wine to wash down his one glass of water. In due course of time he was very much better, if not quite restored to health. This is the most notable of the many cures attributed to the virtue of the Spa waters.

#### THE ELECTRICAL EXHIBITION IN PARIS.

INTERNATIONAL Exhibitions are too often, from their size and from their complex nature, mere shows to the general public, and from their crowded state but poor fields of instruction to experts. We may, however, safely say that these faults will not be found in the Electrical Exhibition just opened in Paris, the things exhibited being easily arranged in a very few classes, and all having so much in common that anybody interested in any one particular form will understand all the others. The late introduction of new forms of electrical appliances into every-day life will ensure a healthy and intelligent interest on the part of the general public in most of the inventions shown, whilst the astonishing rapidity of practical electrical inventions within the last ten years will make the Exhibition valuable to even the best informed experts. The history of electrical inventions shows in the past a series of rapid jumps, followed by steady development. Thus, if we take telegraphy; after the first practical telegraph of Cook and Wheatstone, we have a long period of years in which mechanical ingenuity, aided by the small fresh departure of Morse, gradually developed and improved the existing system without introducing any new principle, as will be beautifully shown at Paris by the collection of old instruments exhibited by the English Post-office department. The next jump occurred when the first Atlantic cable was laid, and the older forms of instruments were found wanting. This led to the modern system of working on cables by the charging and discharging of condensers; thus using the very principle which produced the retardation of the signals under the old system of continuous currents as the means whereby the signals were to be transmitted. This principle has found its highest development in Sir William Thomson's beautiful instrument—the syphon recorder—which, by the way, we fear will not be exhibited at Paris. We then come to the remarkable discovery of duplex telegraphy, by which messages can be transmitted from both ends of a wire simultaneously. This invention was shortly followed by the quadruplex telegraph, and by the extension of the duplex system to the methods used for working long submarine cables. We now come to Graham Bell's articulating telephone. Although this wonderful instrument was only made known to the public late in the year 1876, there are already innumerable modifications of it, and those which are in actual every-day use show how much mechanical skill, aided by sound scientific knowledge, may do in perfecting an invention. The modern forms of "receiver" differ only in form and dimensions of details from the

original instrument, with the practical difference that whilst the old form whispered, the modern forms speak. In helping on the development of telephony a large part has been played by the microphone of Professor Hughes and the carbon transmitter of Mr. Edison. It is this last phase of telegraphic invention which shows the astonishing speed at which applied science is now advancing. Ten years ago the idea of transmitting articulate speech was not formed except as a vague prophecy by some speculative dreamers; and now, thanks to scientific research, mechanical ingenuity, and commercial enterprise, the telephone has become a necessity of business life in England, and in America is largely used for the everyday business of private households. The other great practical and revolutionary application of electricity is the electric light in its different forms. This, again, remained quietly in the laboratory as a scientific curiosity from the time of the discovery of the electric arc until a comparatively late period, but now is extensively used for practical purposes; and, thanks to the labours of Swan, Lane Fox, and others in the field of "incandescent" lighting, we already see a reasonable hope of soon being able to light our houses brightly by night without our health being injured and our books and pictures destroyed.

The storage of energy by electrical and chemical means has secured a new impulse from the invention of M. Faure, and the practical applications of the apparatus will be well shown in the Exhibition; whilst the modern idea of the transmission of energy by electricity will be illustrated by the electric tramway of the Messrs. Siemens, and by many other exhibits. The application of electricity to practical medicine and surgery has always been a specialty of French inventors, and there will be a good display of galvanic *écraieurs*—lamps for illuminating the cavities of the living body, and other apparatus of the operating theatre. In this Exhibition also we shall at last have an opportunity of comparing side by side the countless forms of telephone and electric light which hitherto have only been seen at intervals and apart, so that it has been difficult to form any accurate judgment of their relative merits.

We may be forgiven if as a nation we take a somewhat egotistical interest in the subject of electricity and its application. Leaving out of the question the fact that electricity as a science owes more to England than to any other nation, we cannot help stretching a point or two to claim for ourselves the highest place in its practical application. Cook and Wheatstone are undoubtedly Englishmen, and Sir William Thomson is a Scotchman. Mr. Graham Bell, though a naturalized American, is a Scotchman by parentage, and we claim him. Professor Hughes, though an American, is domiciled in England, and despising logic we claim him also; and, without wishing to disparage Mr. Edison's work, there is no doubt that Mr. Swan, who is an Englishman, is the originator of practical lighting by incandescence. We may naturally, therefore, be anxious to know how the English nation is represented at Paris. We are glad to say that Great Britain is fully and well represented; but, when we come to inquire into the history of the relations between the French Government and the English exhibitors, we have a feeling of shame as a nation and pride in our countrymen. It is a story of the Circumlocution Office, full in official blindness to the importance of science, even in its applied form, and even in discourtesy—unintentional, no doubt, but still discourteous. About the end of December the French Government announced that the Exhibition was to be held, and invited the English Government to appoint a Commissioner to look after the interests of the English exhibitors; but it was not until the first week in March that the French authorities received an answer—a refusal to appoint Commissioners on the ground of economy. This refusal was communicated by the French Government to "The Society of Telegraph Engineers and of Electricians," with a request that they would interest themselves in the matter. But little time was left, as the last day for application for space was March 31st. The Society at once formed a committee to undertake the duties of English Commissioners; and, though the Society is by no means wealthy, they sent out circulars, and succeeded in setting things going. Some time later the Society of Arts suggested to the Society of Telegraph Engineers and of Electricians that perhaps under pressure from the two bodies the Government might be induced to appoint unpaid Commissioners. Of course there was great delay, but finally the two Commissioners suggested by the Societies were appointed, together with two other gentlemen, so that England might be on the same footing as other nations taking part in the Exhibition. Our representatives, then, are the Earl of Crawford and Balcarres, Sir Charles Bright, Professor D. E. Hughes, and Colonel Webber, R.E., and perhaps it would be difficult to find men better suited for the purpose. They have taken up the work already done by the Society of Telegraph Engineers and of Electricians, and carried it forward with the utmost zeal and activity, and the result is, as we have before said, that England will be thoroughly well represented at the Exhibition; but it is unpleasant to reflect that this result is mainly due to the action of private bodies instead of State influence, and that such official recognition as our English electricians have obtained is grudgingly and tardily given, and only on the condition that men shall be found to do the work entirely at their own expense, in spite of the fact that a Government department is one of the principal English exhibitors. We can only hope that the postponement of the opening of the Exhibition from the 2nd to the 11th of August has not been caused by the unaccountable

delay of the English authorities in answering the circular from the French Government.

As to purely scientific matters there has been progress, though not so great as in practical work; but the latest instruments of research will be shown, and the latest advances into the dark region of electrical theory will be expounded and discussed, at the Electrical Congress which is to meet in Paris about September 16. The advances in electrical science, though they may appear small to the general public, are really of great importance, and are only waiting for some electrical Darwin to be combined into some broad generalization, which will put the subject on a level with other branches of physical study.

A great lesson is also to be learned by the unscientific, which will be forced upon them, we hope, by what is to be seen at Paris, and that is, that scientific investigation, however abstract, is constantly making as a by-product inventions of commercial and social value. Thus Mr. Graham Bell and his father studied how to teach the deaf and dumb to speak, and Helmholtz constructed a physical and physiological theory of music, and the direct result is the telephone. The result of the telephone is the microphone, and from the two we get the induction balance; so that the game of pauses and consequences stands thus—cause, investigations as to how we speak and how we write and enjoy music; result, that we find the exact position of a bullet in a living man without operation.

#### SPANISH AND FRENCH ART.

SPAIN, which is still in literature only an echo of France, has begun of late years to take a place of her own in painting—once more, and there are signs that her place will be honourable enough not to be unworthy of her great artistic traditions. There were, indeed, features of the work of Fortuny, the first of her modern masters who gained a European reputation, which were not wholly of good augury for his followers, who in the natural course of things were sure to be more or less his imitators. The brilliancy—the mere bravura—of his pictures was eminently likely to be of evil example to young men, who would naturally forget that Fortuny had first laid a foundation in a solid knowledge of drawing, and could control his brilliant palette by an equally solid knowledge of colour. And, accordingly, we see that he has formed a school which promises to tire the world very effectually of canvases covered with glittering colour and lay figures. But Fortuny was counterbalanced by rivals who, with less originality of genius, were fairly his equals in mechanical skill and soberer in colour. And there seems no want of men in the rising generation of painters who have resolved to follow the better of the two examples given them. Domingo, who is much more than a mere follower of Fortuny's, has found disciples too. The Spanish painters of to-day are not all intent upon seeing how well they can succeed in making a canvas glitter all over without being crude—a feat in which the great majority of men are bound to fail. The danger for the Spanish schools would still seem, however, to be that they should content themselves with attacking only mechanical difficulties. When they do not struggle with the effect of glaring sunlight on white-washed walls and brilliant colours, they are too often satisfied to paint elaborate studies of little else than dress. The effort to obtain mastery of the mechanism of art is no doubt respectable, and what is more it is the necessary foundation of all excellence; but, if Spain is ever to repay France fully for the artistic debt she owes her, her painters must aim at something higher than that.

London has at present an opportunity of seeing a collection of works by a young artist who promises to be the master of a new school, which shall employ its mastery of technical resources in painting subjects which have some inspiration from ideas and the genuine life of the Spanish people. These pictures, now on view at Mr. Colnaghi's Gallery in the Haymarket, are the works of a young Valencian, José Benlliure, whose manner proves him to be a pupil of Domingo's. Some of his works, though admirable in technique, are little more than essays in the manner of his master. Such are his little canvases "The Guitar Player" and "In Waiting." The former represents an elderly man, in an Andalusian dress, seated on a table in the traditional attitude, and playing on the traditional guitar. The latter is a soldier in a seventeenth-century costume. They are both very distinctly in the manner of Domingo, fully equal to the pictures of that artist in technical skill, but still only the works of a clever and loyal pupil. Others of Señor Benlliure's works show almost equally the influence of Fortuny. They are devoted to what have been the favourite subjects of many Spanish painters for years past. We have a study of the doors of the Bull Ring, and the fighters in their picturesque dress, peasants grouped in the sunlight at the doors of wayside inns, beggars wandering in the glaring streets, and *majos* with their *majas*. All these pictures are abundantly clever, but there is none of them which can fairly be said to be original. They are the successful attempts of a beginner to reproduce the manner of a master. In some Señor Benlliure has not been able to escape that splashiness of touch and crudity of colour which are the besetting sins of Fortuny's school. In the small canvas marked 150, and called "Los Musicians Ambulants" (why should Señor Benlliure not be allowed to name his pictures in his own tongue?), the glaring white wall in the background makes the picture crude.

In his "Plaza San Marco" the workmanship is a little splashy, with a flight of pigeons just alighting on the ground in the middle so blurred together that it is difficult to tell what they are meant for. In this and in one or two others the painter has not been successful (perhaps it is not possible to be so fully) in giving the penetrating effect of the southern sun in the clear, transparent, southern air. But all of them, as we have already said, are abundantly clever, with an overflow of life in their figures, and a striking truth in the faces and attitudes. Particularly excellent are the minute figures in the "Procession Religious," and in the picture of a Spanish mule-fair, with a shouting gipsy showing off the paces of his beast.

It is not any of these works which, in our opinion, give the true value to this collection of Señor Benlliure's pictures—not even his "Forge," a carefully-finished study, in the manner of Meissonier, of workmen and a soldier in seventeenth-century dress. We have no wish to underrate the technical skill in this work, but we have to confess that it is employed to say nothing. But there are two of the pictures which show a genuine original power, and prove that, having acquired a mastery over his tools, he means to employ it on works at once national and marked by a strong individuality. These are "L'Education du Peuple," and the "Danse Macabre." We have said that this artist promises to devote himself to the genuine life of the Spanish people, and his "Education du Peuple" is the best proof of it. Hitherto modern Spanish painters, and foreign artists who have chosen Spanish subjects, have been too fond of looking on the people as one great opera chorus. They select what lends itself to effective theatrical grouping, and the human beings of the tableau are allowed to be quite subordinate to the dresses. All Spain is not composed of bull-fighters and *majos*. Picturesque beggars and muleteers (particularly beggars) are great features of Spanish country life; but, if they are to be painted, we prefer it should be for their own sake, and not for the sake of the effect they make in the sunlight. In "L'Education du Peuple" it is the people themselves that Señor Benlliure paints. The picture represents a group of Valencian peasants sitting round a table, and intently listening to a priest, who is reading with oratorical gesture from an imposing folio. Every head is admirably true to life. The condescending priest, who is rightly as much a peasant as the men round him, is well supported by the placid well-to-do farmer on his right, and the powerful labourer, who is listening with all his might to what he wholly fails to understand, on his left. They are the very men who till the soil, not lay figures dressed for theatrical effect. The drawing is admirably firm, and the colour at once rich and sober. The "Danse Macabre" is a wholly different thing. The subject is purely fantastical; but the morbid fantasy which loves to dwell on the ideas of death and the grave is peculiarly Spanish, and the result of a long course of very thorough clerical instruction. Señor Benlliure has thrown himself with all the delight of a mediæval painter into the conceiving and painting of the grotesque fiend who forms the central figure of his picture and the dead of many generations who dance to his wild playing. His technical skill is seen at its very best, as if he had been strengthened by working at an idea which had fascinated him. It is not an idea which we should recommend any artist to dwell on much—extravagance lies that way—but it was legitimate to put it on canvas once, particularly when it is painted as it is by Señor Benlliure.

We do not feel very sure that the sketch of Millet's life, written by Mr. Henley for a selection of that painter's "Etchings and Woodcuts," published by the Fine Art Society, is calculated to encourage young artists preparing to break with a popular and paying tradition; but they may certainly read it with profit. It is a noble example, and suggests the comforting thought that other men will benefit by the neglect from which he suffered. The sad story of Millet's life is told by Mr. Henley both well and briefly. Within a narrow compass he gives all that is really essential to be known about the artist's family and surroundings. His sketch of Millet's life is marked by the good taste which is lamentably absent from a recent more pretentious work on the same subject. He does not dwell with effusive complacency on the grinding poverty which weighed on the painter all through his career. It is enough to tell us that once Millet and his wife "did not do so much as break bread for forty-eight hours." We doubt, however, whether Mr. Henley does his hero sufficient honour in accepting the story that he gave up painting the nude on account of a chance conversation that he overheard. We gather from Mr. Henley's own picture of him that Millet was too strong a man to have been influenced by so slight a thing as that. What he says about the study of Rembrandt—"je pensais qu'il fallait faire des stations avant d'entrer dans la génie de cet homme"—shows the spirit in which he approached the work he really loved. Millet gave up painting the nude because he felt a stronger call to other work, though he afterwards attributed to accident a resolution which was really the result of his own character. He did not allow foolish rumours that he was fit for only one kind of work to influence him in other studies. The facsimiles of his etchings, published in this volume, show sufficiently clearly why his work was so long in becoming popular. It is too faithful to the more painful truths of country life. His figures are those of men and women bowed down by overwork and monotony. "Delvers" look like convicts, and the "Shepherdess" is painfully sad. His country figures are in striking harmony with the descriptions of French provincial life left by Balzac and Flaubert, but they are not more pleasant, and Millet's public wanted their art to be more pleasant than truth, not less so.

For the sadness of his own life, and, perhaps, to some extent, the hard realities of his peasant training, had obviously given Millet an unconscious tendency to dwell on what was gloomy. When he chose to emulate Michelangelo, and "avec une seule figure de personifier le bien et le mal de l'humanité," he was thinking rather of the evil than of the good. This Mr. Hanley sees and acknowledges, but we doubt whether he gives it sufficient importance in his estimate of the truth of Millet's work.

#### THE BILLINGSGATE QUESTION.

THE Report of the Special Fish Supply Committee of the Common Council appears to be, on the whole, a very sensible and practical document. It may not please the agitators who induced the Metropolitan Board of Works to try and steal a march on the Corporation, and it may possibly make the Home Secretary repent the rather ostentatious encouragement which he gave to that project. It is good, no doubt, to have a zealous and reforming Home Secretary, but measure should be observed, even by him who is anxious to have his name written as that of a Great Ædile on stupendous aqueducts and markets covering many a rood. However, the very sensible action of the House of Lords has poured cold water on the enterprise of the Board of Works for the present, and the supplementing of the London ratepayers' little account by a "fish market construction and maintenance" item is still a thing of the future. Meanwhile, there is in the Report of the Committee no trace of the atrocious vices and incapacities which persons of the stamp of Mr. Firth pretend to find in the Corporation. The Committee proceeded to business in a workmanlike way, and accumulated plenty of evidence. They have been found fault with because they did not examine a larger number of retail fishmongers. The simple explanation of this is that the retail fishmongers did not comply with the general invitation to be present, and that the Committee, having no legal powers, could not compel them to come if they did not choose. To begin with, a retail fishmonger, or, for the matter of that, a retail shopkeeper of any kind, is not, as a rule, free to leave his shop at the ordinary business hours. In the second place, retail fishmongers are notoriously in a kind of bondage, half voluntary, half involuntary, to the magnates of Billingsgate. The attachment of the retailer to his wholesale purveyor is one of the most curious features of trade, and one of the best proofs of the power of habit. Moreover, the salesmen have, as the matter stands, very much the whip-hand of their customers, and can effectually boycott them if they please. Except retail fishmongers, however—who, after all, could have given little evidence of real value—almost every class of persons having to do with fish catching, fish carriage, and fish distribution appeared in fair numbers. The circumstances of the case, and some of the most remarkable evidence given, have been discussed on a former occasion. The conclusions arrived at are at present the point of importance. These conclusions can be put briefly. The actual supply of fish is prejudicially affected by the destruction of unsizable and immature fish, and by the spoiling of some of the grounds. Railway rates are too high. Billingsgate is difficult of approach, and not large enough, even if it were fairly accessible. The fish market of the future should be one and indivisible, should be large, should be at the water-side. Of three sites suggested, the Committee disapprove of St. Katherine's Docks, and approve either of the present site with the Custom House thrown in, or of one at Blackfriars Bridge. The market should be both wholesale and retail, and should be open at all hours, an official salesman being appointed. There is also a partly inconsistent suggestion of sites for an inland market for railway-borne fish in case it is thought necessary.

All these conclusions, except the last, seem good. A rival market to Billingsgate would, in all probability, share the fate of Columbia; a supplementary one would defeat its own object. The retailer has not time to drive about London from one market to another. But all the other conclusions of the Committee appear sound. In discussing the destruction of unsizable fish and the misuse of the fishing grounds, they may indeed be said to be travelling a little beyond their special field; but the subject is one of great importance, and deserved their attention. Hitherto, except in the case of shellfish, there has been no attempt at a legal limit of size; and, unfortunately, the intention of the law as regards shellfish is too often defeated by the unsizable specimens being left on the beach to die and rot, instead of being returned to the sea. In the case of fish proper, and specially of soles, the waste arising from the catching of mere infants is enormous. But the proposal as to the market itself is what most people will look to. There can be little doubt that most of the mechanical difficulties which make fish dearer in London, despite the unrivalled facilities for transport by land and sea, than it is in any large town in the kingdom, could be surmounted by the throwing of the Custom House into Billingsgate, and by an improvement which would then be much easier than at present of the approaches. The suggestion, made unofficially, that the premises under Cannon Street Station should be used as a kind of *entrepôt* for transferring railway-borne fish to Billingsgate would, if it could be carried out, be an immense relief to the streets surrounding the market itself. On the other hand, the alternative site at Blackfriars has railway communication close at hand. The Government, as represented by the present Home Secretary, has not shown itself too favourable to any plans for retaining Billingsgate, and the chance of

secuting the Custom House may therefore seem to be remote. But either the present market, so enlarged and approached, or the new one at Blackfriars, would meet the necessities of the case as regards space very fairly. St. Katherine's Dock is doubtless too far, and is by no means very easy of access on the land side. More important still are the suggestions for the regulation of the market. The retail selling of fish on the great scale side by side with the wholesale trade would, of itself, tend to keep down prices, by making the senders more independent of the salesman-consignee. The appointment of a competent official salesman would make all the ugly malpractices which have been hinted at—such as the marking of false prices and the boycotting of salesmen who will not agree to deceive, if not to defraud, their correspondents—impossible; and the extension of time would relieve the present pressure almost as much as the extension of space and the opening up of new approaches. It is not obviously to the interest of any one but a ring that sales should be huddled over at an unearthly hour in the morning, and that it should be impossible for the retailer to buy it at any other time. Most of the provisions recommended are, we believe, already in force in the Dead Meat Market at Smithfield, the excellence of which as a distributing centre is universally recognized.

The question is really, as has been before pointed out, one of much more than merely ædile or administrative importance. The simple fact is that fish ought to be the cheapest kind of food, and that it is in London certainly, if not in all large towns, one of the dearest, perhaps the dearest. The improvement in the machinery of distribution ought to be, and probably would be, only preliminary to a still greater improvement in the quality and nature of the supply. This makes the matter one of importance not merely to London, but to the whole country. Despite the overfishing complained of, it is certain that the seas are not made to yield anything like what they would yield if a free and easy sale encouraged fishermen to catch and railways to carry cheaply. If the sea is worked insufficiently as a source of supply, the rivers and ponds are not worked at all, and fish culture generally is strangely neglected. Every one has heard, if every one has not seen, the great breeding establishments at Arcachon, and all round the French coasts there are similar things on a smaller scale, while in the interior reservoirs as well as natural ponds are carefully utilized. In England, except by little boys with crooked pins and by poaching scoundrels with dynamite, the majority of such pieces of water are for the most part not used at all, or used for mere sport and not for food production. Now that landowners are at their wit's end to know what to do with their land, it is at least worth consideration whether it might not be worth while to try if some of it would not do as well under water. Fish farming is, after all, not much less promising or more startling than rabbit farming, not to mention that there are competent authorities who hold that draining has been overdone, and that the formation of properly regulated meres and ponds in suitable parts of the country is the best way of preventing both drought and floods. Some of these daring persons even go so far as to calculate that, acreage for acreage, water is as fertile in the way of food production as land and far less expensive to cultivate. This may or may not be fanciful, but there can be no doubt that even as it is much more might be made out of inland waters than is made. Not many months ago a paragraph went the round of the papers telling how many hundredweight of fish had been dragged from a small pond at Kew Gardens, where no pains whatever had been taken to breed them. These, indeed, were not wasted, for they were given to an Angling Association on the Thames to stock its fishing-ground with. But in most ponds the fish are simply left alone to keep themselves down by eating each other, which, to do them justice, they do with great resolution and success. Again, any one who looks at the news from fishing ports will constantly see that large quantities of the coarser fish, and not unfrequently large quantities of the finer, are said to be a drug in the market—no sale for them. There is no sale, partly because the fish-distributing machinery of the great towns, and of London most of all, is utterly inadequate, and secondly because this very inadequacy has lessened the demand on the part of the consumer. In the poorer quarters of London, as the sense of smell informs everybody, there is, indeed, an immense demand for fried fish. But, excellent as fried fish undoubtedly is, the mode of cooking it is not adapted to every kind or even to very many kinds, and therefore causes an undue run on the flat variety. Cookery ought to come to the aid of police and municipal arrangements, and, after or before persuading the hardened salesman to give us fishes of many sorts, to teach our domestics how to cook them. There is no need to exhort the whole nation to become ichthyophagous. But worse crazes than the propagation of ichthyophagy might be found for an idle man to devote himself to.

At present, however, there is something ironical in the suggestion of an agitation for the promotion of fish-eating. The difficulty, in London at least, is not so much to get people to eat fish as to get fish to eat. It is almost impossible to conceive of an England without soles, yet pessimists tell us that we are approaching that state. Not only are the flattest, the most unpronounced in flavour, and for that very reason the most perpetually eatable of fishes, not "all four feet," as, according to Thomas Ingoldsbay's excruciating pun, they once were, but they seem to be approaching a uniform dimension of four inches. This is perhaps not due to Billingsgate, but the comparative absence of substitutes and the dearth of them when discoverable certainly is. It is

whispered that the raising of rents, that is to say prices, at certain establishments in the immediate neighbourhood of Greenwich Hospital, has determined some of their frequenters to bring in a Fish Bill next Session to provide that for fifteen years the price of fish dinners shall not be raised, and that at the end of that time it shall be judicially fixed by a competent tribunal. The famous suburb, however, is still in Saturn and Jupiter—that is to say, it is still regulated by the ordinary principles of political economy, and if the Corporation succeed in acting on the recommendations of their Committee, there may be no need of such violent measures after all.

#### THE GOLD WITHDRAWALS.

THE Italian preparations for the resumption of specie payments have already had an effect upon the money market, and in the opinion of some are likely, before the end of the year, to cause disturbance. We think, however, the apprehensions on this head are exaggerated. To carry out the resumption of specie payments the Italian Government has been authorized to raise a public loan, sixteen millions sterling of which are to be in gold. A part of the loan, as our readers are aware, was brought out a little while ago here in London, the contractors undertaking to find the sixteen millions which the Italian Government requires. At the time the London money market was exceptionally easy. The setting in of the holidays had brought speculation to a standstill, and the value of money—to make use of bankers' phrase—had suddenly declined very considerably; or, to express the matter more correctly, the interest paid in the short loan market for the use of capital had fallen greatly. The contractors judged properly that then was the time for them to begin to provide themselves with the metal which they had engaged to find. As the value of loanable capital was so very low, it was evident that the amount of loanable capital in the market was too great, and, consequently, that the market could well bear the abstraction of a part. Accordingly, they began in the dead season, while business was, as it were, suspended by holiday-making, to buy up in the open market and to withdraw from the Bank of England parcels of gold. They did not, however, confine their operations to this country. The syndicate that contracted for the loan is an international syndicate, and it has been careful to extend its operations wherever gold is to be had most cheaply. A moment's consideration will show that it is as much to the interest of the contractors as to that of anybody else to avoid making money dear. By doing so they would raise the market against themselves, and lose the profit, or at least a portion of it, the hope of which had induced them to contract for the loan. We may be very sure, therefore, that knowingly they will do nothing which will disturb the money market. And we are inclined to think that the precautions they have taken are such as will avoid disturbance. The 16 millions which they have contracted to find are to be supplied in two years; in other words, the abstraction of this amount from the stock of metal in other countries is to be spread over a period of two years. The operation is, therefore, somewhat like the diversion, to Italy of two years' yield of the American gold mines. This spreading of the operation over so long a period is intended to avoid the disturbance of the money market. The withdrawals are to be so arranged that they shall not take place when there are other great demands upon the market, and, consequently, shall not accentuate the periodical rises in the value of loanable capital which annually occur. We have said that the contractors began to provide themselves with a portion of the gold as soon as they had successfully launched the loan, thinking that the slack holiday season was the most favourable time to do so; and they estimated that they would be able to provide in London and upon the Continent about three millions sterling of gold without seriously enhancing the rates of discount. They have already in England, France, Germany, and Russia obtained about two millions, and during the present month it is understood that they will take another million. This present week and next week, we believe, will end the withdrawals from the Bank of England. It is the intention of the contractors to suspend their operations then so far as gold is concerned until the present year is at an end, as other causes will soon come into action which usually raise the rates in the money market towards the close of the year, and they are unwilling, as we have already said, to aggravate these.

The mere withdrawal of sixteen millions of gold within two years from the stocks of the metal of all Europe would not be likely to disturb the money market, and so far as the London money market is concerned the withdrawal of from a million to a million and a half in the course of the present summer could hardly be expected to have a very serious effect. But it is to be borne in mind that the present harvest is better than any we have been favoured with for some time back; that it is also very early; and that the harvest operations usually take from London a considerable amount of loanable capital. It is also to be borne in mind that trade has been improving, slowly it is true, but still has been improving for the past two years, and that the improvement of trade means augmented demand for capital, and consequently tends to enhance its value. Further, it is not to be forgotten that France does not look favourably upon the resumption policy of Italy, that the French have abstained from all participation in the Italian loan, and that the Bank of France and the financial world

of France generally are expected to put all the obstacles in the way of Italy in this measure that they can. It is possible, therefore, though in our opinion it is not probable, that the Bank of France may raise its rate of discount in order to prevent gold being taken from France for Italy, and may thus begin the struggle for gold which has so long been apprehended. Lastly, it is not to be lost sight of that we are now close upon the time when the movement of the crops in the United States causes a drain of currency from New York to the interior; that, in consequence, the New York money market becomes stringent; and that this, in its turn, leads to a drain of gold from Europe to New York. This drain in the past two autumns has averaged fifteen or sixteen millions sterling, and if a similar state of things was to set in now, while the withdrawals for Italy are suspended over the market, the effect, no doubt, would be very great; in the opinion of many must inevitably bring about dear money.

The autumnal outflow of gold from London to the provinces for harvesting and other operations is a movement so small, so temporary, and so regular, that we do not think its effect will be very great. It is now so thoroughly understood that its extent and duration can be fully measured, and what is thus measurable seldom causes alarm, and without alarm the money market is seldom disturbed. As regards the action of the Bank of France, again, we can hardly think it likely that it will begin the apprehended struggle for gold. When the Bank was possessed of a large stock of that metal and but a small stock of silver, everybody expected that it would take measures to protect its gold; but it deliberately avoided doing so. We cannot think it at all probable that it will now, when it is too late, do what it refrained from then doing. It cannot be the desire of the French Government or of the Bank of France to make money artificially dear, and unless money is made extremely dear, the Bank of France could not now hope to supply itself with such a stock of gold as would make up for the drain of the past two years. If the Bank of France bides its time, the return of good seasons will once more make France a creditor country, and then she will be able to re-supply herself with gold without any violent exertions. But now to begin a struggle would be to add to the depreciation of silver, and to disturb the money markets of the world without much avail. We expect, therefore, that the Bank of France will continue to pursue the policy it has deliberately adopted, and that it will do nothing to make money artificially dear. The case of the United States is different. There is little doubt that the rest of the world is indebted to the United States. The exchanges upon London, Paris, and Berlin show that very plainly. And it follows, therefore, that, if the United States require gold, it will be in their power to take it. But we can hardly think that the United States will require gold in the amount of the past two years or anything like it. Between New Year's Day 1879, when the American Resumption Act came into operation, and the 1st of November, 1880, the gold and silver coin in the United States increased 47½ millions sterling; since the 1st of November last there has been a very large import of gold from France and England, the bulk indeed of the drain last year having fallen in the last two months of 1880, and during the banking crisis at the beginning of March there was another considerable import of gold into New York. We shall not, therefore, overstate if we set down the import of gold into the United States from Europe since the 1st November at another ten millions sterling; and to this has to be added the whole production of the United States in the interval, not only of gold, but also of silver. Within the last 2½ years, therefore, the addition to the metallic money of the United States has been at least 65 millions sterling, and at the same time the whole of the paper which previously formed the sole currency of the country has remained in circulation. The 65 millions are, therefore, a net addition to the money of the country. It would seem, consequently, making full allowance for the growth of wealth, the development of trade, and the inflation of prices, that the currency requirements of the United States must by this time be nearly satisfied. It is true, however, that of all the gold that has been exported from Europe to the United States in the past two years, not a penny has returned. It seems to follow that, large as the drain has been, it is barely sufficient for the ordinary trade requirements of the country, and, consequently, must be insufficient for times of extraordinary demand; such as when the crops are being moved. But it is to be borne in mind that a large portion of the gold which has been taken from Europe for the United States has been locked up in the Treasury. The Treasury has been refunding its debt at lower rates of interest, and, to do so successfully, has been keeping in reserve enough of money to meet any demands that might be made upon it for the payment of principal by those who refused to accept the lower rates of interest. But these refunding operations are now concluded, and the Treasury has to pay before the 1st of October 19 millions sterling of debt. The disbursement of so immense a sum must lower the value of money in the great cities of the United States, and must go far to fill up whatever void there may still be in the currency. Lastly, it is to be recollected that European holders of 5 and 6 per cent. bonds to a large extent refused to accept the reduction of interest to 3½ per cent. We believe that about 7 millions sterling of these bonds have been sent over to New York, and the value of them is due to the holders in Europe. In other words, the United States owe Europe about 7 millions sterling for these bonds, and this amount must be set off against any demand there may be upon Europe for gold. Assuming, therefore, that otherwise the demand for gold would equal the demand of

last year, that is to say, would amount to about 15 millions sterling, the balance due to the United States would be reduced to about 8 millions sterling, or very little more than half what it was this time last year. For all these reasons, and others which might be mentioned, we think it extremely improbable that the demand for gold from the United States will nearly reach the level of the past two autumns.

From whatever point of view we look at the matter, then, we see no reason to expect a disturbance of the money market by the withdrawals of gold for Italian accounts, though they will, of course, make money dearer. The withdrawals in themselves are too small to cause disturbance, and the drain to the United States this autumn is almost sure to be much smaller than it has been in recent years. It is true that the stocks of gold in the chief banks of Europe, especially in the Bank of England and the Bank of France, are much smaller than they were a year ago. But, on the other hand, it is to be recollected that a raising of the rate of discount would quickly bring large amounts of gold to both banks. The gold circulating in France is still of very large amount, and the Bank of France, were it to set about doing so in earnest, could very speedily get in large sums from that source. So, again, the Bank of England could collect much gold which is now held in various places throughout the United Kingdom, were it to stand in need of it. Furthermore, a slight rise in the value of money in Europe would tend to stop the drain to the United States. It is always to be remembered that gold is sent to the United States at a considerable cost, both for carriage, for insurance, and for commission, and that unless it can be employed in the United States, so as to cover this cost, and to yield a larger profit than would be obtained for it at home, it will not be sent. Every rise in the rate of discount here, therefore, unless it is counterbalanced by an equal rise in New York, must tend to check the outflow of gold; and were the rate of discount to rise to 4, or at any rate to 5 per cent., it would be almost certain to stop the drain altogether. Indeed, if there were to be really dear money in London, we should have gold coming back from New York instead of going thither.

#### RACING IN SUSSEX.

WITH the exception of owners of horses and those who are professionally interested in racing, few people, generally speaking, care to frequent racecourses between Goodwood and Doncaster. This year, however, the two-year-old racing had been exceptionally interesting. There were two or three batches of two-year-olds that had shown themselves to be within a few pounds of each other, and there seemed to be every prospect of representatives of these groups meeting at Lewes. Many people, therefore, who were staying in the neighbourhood of Goodwood found it worth while to remain within reach of Brighton and Lewes for a few days longer. After the heat of London, a fortnight on the South Coast is far from unpleasant. The bulk of the racing at the Brighton meeting, which intervenes between Goodwood and Lewes, is not always of a very exciting character, most of the stakes being 100l. Plates; but, nevertheless, there are sometimes good races at Brighton, as it is worth the while of owners to keep their horses a week later in the South when once they have taken them to Goodwood.

Racing men had an opportunity of buying some yearlings on the Saturday between Goodwood and Brighton at the Sandgate Stud farm. Twenty-four well-bred yearlings were brought out for sale. On the whole, they were considered a good-looking lot, and they were by such sires as Hermit, Adventurer, Macaroni, Kingcraft, Rosicrucian, and Paganini. The first lot only realized 25 guineas, and the last went for 30, but a colt by Hermit was sold for 950, and another by the same sire made 700 guineas. The average of the entire sale was a trifle over 250 guineas, which was not bad, although it was nearly 50 guineas short of the averages obtained this year at the sales of the Marden Deer Park and Cobham yearlings.

On the opening day of the Brighton meeting, the Brighton Stakes was won by Thunderstruck, a three-year-old that had won three races last year. Blackthorne, who had been third in the Goodwood Stakes, was second, and the unlucky Lansdown was third. There was a beautiful race on the second day for the Ovingdean Welter Handicap. Rowiston was the favourite, but he was not even placed. The race was fought out between Knight of Burghley, Telescope, and Goggles. Just at the last, Cannon contrived to get Telescope's head in front of his two adversaries, who ran a dead heat for second place. Two excellent races followed, and then came the Brighton Cup. We fear that our readers will consider our racing articles of this season little more than chronicles of the vagaries of Peter, but we are compelled to allude to them again. It is sincerely to be hoped that this may be the last occasion for some time to come that we may have to mention the horse's name, for such an evil-dispositioned beast would be far better out of training. Yet Peter has run in so many important races this year that all racing historians have been obliged to give frequent accounts of his proceedings. Three horses were to run against him for the Brighton Cup, but the only one that seemed at all likely to beat him was Exeter. His former splendours were anything but forgotten, but nevertheless only 12 to 10 was laid against him, while 12 to 10 was laid against Exeter. This was certainly a very fine distinction, but it just established Peter as first favourite. As Archer was not riding,

and Cannon's services were claimed by Prince Soltzko, Wood was entrusted with the unenviable task of riding the evildoer. Exeter jumped away with the lead, followed by Eurus and Whisht, while Peter brought up the rear. They had scarcely run two hundred yards when the usual thing happened, Peter pulled himself up with a jerk, and threw up his heels. Wood then showed some good jockeyship, for he resolutely set the horse going again, and was soon sailing away in pursuit of the three leading horses. There was a great distance of ground to be made up, but Peter now appeared to be in the best of humours, and he swept over the course so freely and courageously that Whisht and Eurus were both caught up and passed in less than half a mile. Exeter was now leading by something like seventy or eighty yards, but Peter kept gradually reducing this distance, until, at the top of the hill, there were only about thirty or forty yards between them. There seemed to be scarcely any doubt now that there was to be a repetition of Peter's clever performance in the Ascot Royal Hunt Cup. He never had seemed to be running better, and as he came down the hill he lessened the gap between himself and Exeter very rapidly. At the foot of the hill he was but three lengths behind, and was yet apparently pulling hard. Rossiter was now hard at work on Exeter, who was running very like a beaten horse. Suddenly, to everybody's astonishment, Peter began to flag, whether from temper or fatigue it is hard to say, while Exeter plodded gamely on, and passed the winning post ten lengths in advance of Peter. Eurus was third, about a hundred yards in the rear of Peter, and Whisht trotted in some time afterwards. Exeter has been a useful racehorse, having won a good many valuable prizes. His first race was in the Derby won by Sir Berys, and he was third in the St. Leger to Rayon d'Or. He is a grand specimen of a horse, and he stays well over a long distance under heavy weights. The Brighton Cup day ended with a dead heat between a couple of two-year-olds ridden by Wood and Cannon. These were Resin the Bow and Vale. The former, who was giving weight to his opponent, had already won three races out of five this season, and he had been placed in each of the races in which he had been defeated. On the last day of the Brighton meeting Toastmaster won the Stewards' Cup in a common canter by half a dozen lengths. The unlucky Evasion ran second; but Chevroneal, who had won several races this season, ran unaccountably badly, after making the running in the early part of the race. Three closely-contested races followed. Backers had to bear a terrible disappointment in the Cliftonville Plate, for Whitechapel, on whom they had laid the long odds of 9 to 2, was beaten by the 14 to 1 outsider Gaydene.

The Lewes meeting began on the Friday. A large field of thirteen two-year-olds came out for the Great South of England Breeder's two-year-old Stakes. The Peine de Cœur colt was the favourite. This colt had run three times without getting beaten. At Worcester, in the Coventry Stakes, he had given 18 lbs. to Gaydene, the hero of the last race mentioned in the preceding paragraph. At Sandown he had beaten Executor, who had been a great many lengths behind him in the valuable British Dominion two-year-old Stakes, yet now Executor, against whom 14 to 1 was laid, beat the Peine de Cœur colt by a head. The most interesting race of the Friday at Lewes was the Astley Stakes for two-year-olds. Last year this had been the best race of the season, five horses having been within a head of each other at the finish. Now only five competitors came out for it; but among these was Lord Stamford's Geheimnis, a brown filly by Rosicrucian, who had won four races, and had never yet been beaten. One of her opponents was Marden, whom she had beaten with great ease at Stockbridge; but he was supposed to have improved greatly since his previous contest with Geheimnis, and between Stockbridge and Lewes he had run within half a length of Kermesse for the July Stakes, both Dutch Oven and St. Marguerite being behind him. It may be remembered that Dutch Oven subsequently won three races, one of which was the Richmond Stakes at Goodwood, in which she beat both Kermesse and St. Marguerite. It seemed not unlikely that Marden, Kermesse, St. Marguerite, and Dutch Oven might be within 4 lbs. or 5 lbs. of each other; and, if the Stockbridge running was incorrect, it appeared possible that any of the four might be as good as Geheimnis. Marden was only to carry 1 lb. penalty, whereas Geheimnis was penalised with 4 lbs.; so it seemed reasonable enough that Marden should be a good second favourite. Isabel, a winner of several races, was the first off, but Sir Frederick soon took up the running, and kept it until they had run half-way down the hill. Marden then took the lead, and ran very well, with Geheimnis in attendance at his heels, Isabel and Foxglove following pretty closely. In the dip it was evident that Marden and Geheimnis had completely beaten the rest of the field. A struggle then began between the leading pair, but it was of short duration, for Geheimnis passed Marden without much difficulty and won very easily by a length. When the ease with which Geheimnis won the Astley Stakes is considered in conjunction with her other victories there can be no doubt that on public form she is the best two-year-old that has been out this season. Between the Sussex fortnight and Doncaster, comparatively few people will care to trouble their heads very much about racing; it is therefore very satisfactory to have had the Midsummer two-year-old form to a great extent unravelled before the beginning of what may be called the second part of the racing season. During the autumn it is possible that some fresh two-year-old may come out and eclipse all the earlier performers. Students of two-year-old running can scarcely have failed

to notice that of late fillies have distinguished themselves more in their two-year-old careers than colts. During the last few years we have had such an extraordinary success of flying fillies that one is tempted to doubt whether the allowance for sex at present made to two-year-old fillies may not be excessive. Mares may possibly mature more rapidly than horses, and it is, perhaps, an open question whether a filly at two years old may not be a more formed animal than a colt of the same age.

The second day of the Lewes meeting is one of the very few Saturdays in the year on which there is any racing of importance. As much as 2 to 1 was laid on Marden for the Priory Stakes. Last week we noticed that Carlyle, after being first favourite for a two-year-old race at Goodwood, had run absolutely last of the four competitors; but it was his first race, and, after all, there was not three-quarters of a length between the four horses at the finish. Cannon, who was riding Carlyle, complained of the riding of Archer and Wood, who rode the second and third in the race, and the stewards so far credited his complaint as to reprimand the accused, so it is not improbable that Carlyle may not have had a fair chance. Now Carlyle started for the Priory Stakes at Lewes, and, after a very severe race, he beat Marden by a head. Lady Emily, who beat Isabel at Newmarket, ran a dead heat with Marden for second place. This performance on the part of Lady Emily was the more creditable, because both Carlyle and Marden had an allowance of 4 lbs. The finish for the Priory Stakes was one of the prettiest that has been seen this season.

#### THE THEATRES.

**YOUTH**, the play lately produced at Drury Lane Theatre, is somewhat disappointing as a successor to *The World*, which was the work of the same authors, Messrs. Harris and Meritt. The former production was definitely but legitimately melodramatic. It consisted of a series of striking situations every one of which had been used in some former piece on some former occasion. The art was to string them together with a coherent and telling, if not very probable, story, and this was done with signal success. In *Youth* the effort has obviously been to devise less familiar but equally striking effects, and if there is nothing really new in presenting a huge "practicable" ship, or a battle-scene, or a moving panorama on the boards of the theatre, it may be conceded that at least one of the effects just referred to is put before the public with some originality in invention and success in execution. This is the departure from harbour of a "troop-ship," of which, of course, only a portion is seen, the stage manager's art being devoted, with much skill, to suggesting the huge bulk of the unseen part. Unluckily, this particular scene is marred by some odd blunders which could have been easily avoided. The Colonel of the departing regiment, for instance, wears gilt spurs, and the Major is allowed to be grossly insubordinate without rebuke, while the drummers, whose number seems excessive in comparison with the fighting strength of the company, beat their drums with white drumsticks. The battle-scene, which follows close on this, might have been made a singularly effective piece of work; but, unfortunately, the hand-to-hand combat which succeeds a profuse employment of powder, and upon which the curtain falls, comes very tardy off. For effects of this kind trained "actors," in the most technical sense of the word, are needed; and the *comparés* who appear on the stage of Drury Lane as struggling Afghans and Englishmen are, it must be said, hardly equal to their task. Few things, perhaps, are more difficult to manage with success than a stage fight; but a better result might have been secured if less attention had been given to the small-arms supplied, as the advertisements tell us, by a well-known firm, and more to the training of the supers whose mimic conflict is as absurd as may be. The same want of intelligent teaching and learning is observable in the troop-ship scene above mentioned, where much might be made, but nothing is made, of the emotions of the crowd assembled to see the regiment off. So also the scene in the convict prison suffers from what seems the belief of the authors that to make a good melodrama all that is necessary is to bundle together as many effective set scenes as they can think of without any reference to cohesion or action. There is action of a sort in the convict scene; the convicts walk in much as convicts do walk in in real life; one of them behaves as no convict ever would be allowed to behave; a deputy-governor behaves as no deputy-governor has ever behaved; and there is a kind of scrimmage at the end, which is only too true to real convict life. But, so far as we can see, nothing really important to the progress of the play comes of all this; nor is it, perhaps, surprising that nothing should come of anything in a piece the hero of which is sentenced to penal servitude for having accepted a forged bill. Perhaps in the next Drury Lane piece (we cannot dignify *Youth* by the name of melodrama) we may find a person sentenced to death for being an involuntary bailor.

It is a pity that a piece so bad in all ways as *Youth* should succeed a piece which was so good in many ways as *The World*. To criticize the setting of such a production by a singularly good company would be absurd. All that can be done with the incoherent rubbish provided for them to speak is done by the players now engaged at Drury Lane. Whether it was necessary to have any dialogue or any people to speak it may be doubted.

#### REVIEWS.

##### HOLUB'S SEVEN YEARS IN SOUTH AFRICA.

SO numerous and frequent have been the journeys of exploration in Africa of late that the "Dark Continent" is rapidly losing its mysterious character, and becoming familiar to the geographer and to the ordinary reader of books of travel. South Africa, better known than the central portion of the continent, has acquired a fresh and absorbing interest in consequence of recent events there; so that any work which contributes more accurate information about the country is sure of a welcome at the present time. Dr. Holub's book has many claims to a good reception; for it supplements the pioneer work, which has been already done, by scientific investigation, and it is the work of a thorough enthusiast for his subject. Dr. Holub is a young Austrian physician, who, having been in youth fired with a desire for African exploration, steadfastly set before himself this object, and has succeeded in carrying it out, in spite of pecuniary and other disadvantages. When he arrived at Port Elizabeth, and had paid the duty on his gun, he found himself the possessor of a single half-sovereign; but some letters of introduction which he had brought with him procured him a hospitable reception, and he ultimately settled down as a medical man at the Diamond Fields. His preliminary journey thither, across the Orange Free State into the Transvaal, is described with the minute accuracy of a thorough observer and an enthusiastic naturalist. He also tells us much about the Boers, and of the wonders they perform in bringing down the springbok, in hunting which they have acquired a dexterity with the rifle of which our poor fellows in the late war had but too sad an experience. The traveller himself, anxious as he was to add to his natural history collection, does not appear to have been very successful as a sportsman, at least with larger game, and he relates most naively over and over again how he stalked an antelope or herd of baboons and missed them after all. On one occasion he contrived to shoot himself through the hand.

The Doctor's prospects at the Diamond-fields seemed at first dismal enough, but fortunately for him, a person to whom he had brought a letter of introduction happened to be sick, and a successful cure of his new-found friend soon led to a practice. As this extended he was enabled to exchange his tumble-down hut, with old boxes to serve as chairs and sheeting for window, for a somewhat more commodious dwelling; but, so bent was he upon carrying out his original plan, that he continued to practise the most rigid economy until he was at last in a position to buy a waggon and other requisites and set out upon his travels. The account he gives of the Diamond-fields themselves is interesting; but not unlike those of the mining communities of America with which Bret Harte has made us familiar. The chief interest of the book lies in its descriptions of the flora and fauna, and we learn much that is new and startling about the numerous varieties of noxious beasts that infest the country. We are accustomed to such startling revelations of science that it is not safe to question any statement made by a scientific man as to the phenomena he may come across in his investigations; but we must confess that some of Dr. Holub's anecdotes of animals require a severe application of the faculty of faith. His baboons, for instance, show a craft and intelligence that is absolutely uncanny. They are always on the look out, and if a field or garden be left unguarded, they at once break through the hedges and devour the crops. They will even watch until a shepherd is for a moment absent from his post, and will then seize on the lambs and rip them up to get at the milk which they have just been drinking. Most of the snakes of the country, too, "mean venom," and are most dangerous creatures to come across. Dr. Holub counted no less than seven distinct species of the cobra. Of these, two at least have been known to make unprovoked attacks upon human beings, and a case came within the author's own notice where the reptile actually followed some Kafir children who were running away from it, and, on their slackening speed, bit one of them in the heel, causing death in a quarter of an hour. Another kind suspends itself by the tail with its body hanging down as straight as an assegai, and waits to attack any man or beast that may pass by. Since it is of the same colour as the foliage by which it is surrounded, it is, as may be imagined, a very insidious foe. The native antelope traps, consisting of a poisoned javelin suspended in a similar manner and easily released by running against a rope which is stretched across the opening in a hedge, is also a source of no small danger for the inexperienced traveller. The ring-neck snake will curl itself around the hind leg of a cow and suck the milk from the animal's udder until it is satiated.

Of all the author's own escapes from death by water or the want of it, by fire, men, animals, or reptiles, &c., one of the narrowest was perhaps from mud, in which he was stuck fast when trying to ford a river alone, and was in imminent danger of suffocation. Another time he swallowed some tempting-looking fruit, and found that he had taken *nux vomica*, the result being poisoning, from which he with difficulty recovered. Judging from his descriptions, as well as from the woodcuts which accompany them, South Africa is a veritable lotus land; all is quiet, luxury, and rest; but death lurks everywhere amid its loveliness.

the journey was chiefly to reconnoitre and get acquainted with the country, and did not advance far into the interior. Returning to Dutoitspan, he again set up his practice as a physician, and in time had made another 700l. or 800l., with which he once more started off for the interior. The country traversed was that beyond the Transvaal border, and is divided into small kingdoms, all of which, with the manners and customs of their rulers and people, Dr. Holub describes in a pleasant and amusing style. On this journey also he had some thrilling escapes, being nearly caught up, with his waggon full of gunpowder and cartridges, by the flames of a burning steppe over which he was travelling.

King Montsua's capital a community of native Christians is, and it is both interesting and instructive to read the account of their struggles against, and determined opposition to, the heathendom around them, reminding one of the story of the early Churches at the commencement of Christianity. Montsua insisted on the "bathu ba lehuku," or "people of the word," as the converts are called, taking part in the time-honoured ceremony of the reed dance; this is performed by a number of men who walk in procession through the town blowing upon reed-pipes with such vehemence that nearly always some of them drop down dead during the progress, or subsequently die from the acute emphysema of the lungs brought on by the exertion. The Christians refused this demand, as well as another summons to join in some ceremonies connected with rain magic; and the King, unable to reduce them to obedience, rushed into the little church with a long knife and cleared the building. At length the converts so increased in number, and were obviously so much more thriving and industrious than the rest of the Bechuanas, that Montsua laid aside his opposition, and even encouraged the spread of the new faith. It is clear that, whatever may be the case elsewhere, missionary efforts have done wonders for Africa. In the kingdom of Khame their influence has been so great that the young potentate has prohibited the importation of brandy into his dominions, and a real and progressing civilization is springing up among the native tribes under his authority.

The native Bechuana method of doctoring is efficient, but characteristic:—

In disorders such as typhus and dysentery sudorifics are the remedy most frequently exhibited. The patient is made to lie down in his best fur jacket, or in a warm woollen shawl, bought probably for the occasion, and when the medicines have done their work, the nyaka reappears and carries off the garment to bury it. The patient may be rejoiced at having the disorder so effectually carried out of the house; but if, when convalescent, he should happen to see the doctor's wife parading the village in his jackal-skin, or in the comfortable shawl, he would never venture to hint at its restoration.

King Sechelo, another of the monarchs of the country beyond the Transvaal, is an interesting study, and seems to live in a quite luxurious English style:—

"Morena (King)," said the Doctor to him, "when I was only thirteen years old I read your name in Nyaka Livingstone's book. I little thought that I should ever see you and speak to you; far more surprising is it to me to find myself drinking tea in your palace." The King, although he still practised rain magic, had become familiar with some passages of Scripture, and said with a sanctimonious air, "His ways are past finding out."

Sekhomo, ruler of the Bamangwatos and father of the Khame just mentioned, was a very different sort of person to his son, whom he more than once unsuccessfully attempted to murder. Dr. Holub had some visits from this monarch with his council of "black crows."

When he arrived Sekhomo would keep on shaking my hand, while his factotum, who could speak Dutch, would be perpetually begging for something in his master's name. The King at other times would stand with his arms akimbo, his myrmidons squatting around him in a semicircle, and imitating everything he did; if he laughed, they laughed; if he gaped, they gaped; if he yawned, they yawned; and one day when his Majesty burnt his mouth with some tea that was too hot, they all puckered up their faces as if they likewise were experiencing the pain; when he turned to go home, they rose and followed him in single file like a flock of geese.

Returned to Dutoitspan, the Doctor found himself in the same pecuniary difficulties as before; but, after the same struggles and the same sparing, he at length again found himself in a position to undertake another journey.

This third expedition was the realization of his hopes and anticipations, for he was at length to become an explorer in the full sense of the word. He here advanced far into the Zambesi country, and succeeded in reaching the Victoria Falls. Although the travels of Livingstone have made us familiar with this district, Dr. Holub has much that is new and interesting to tell us; and some, at least, of the country explored by him is new. The enlightened rule of Khame, who had now defeated and succeeded his father, and through whose territory the traveller passed, gives good promise for the future of Africa and the capabilities of the negro races. This journey was not at all inferior to the others in point of interest and incident, while its results to geographical and physical science were much more important. Here, again, the fauna behaved in an unprecedented manner. Lions were met with in unpleasant abundance; indeed, in the valley of Panda ma tenka they "ran about like dogs." In the Matabele country these animals are so crafty that "sometimes a group of them institutes a sort of *batu*. A few of them creep up and exhibit themselves to the victims they want to catch, thus scaring them back into the very clutch of the main body that lurks behind ready to receive them." Hippopotami are also found in numbers in the rivers, and are a constant source of danger to the canoes, while crocodiles swarm

by the banks ready to snap up any vulnerable person who approaches the shore, or happens to dip into the water. By this time Dr. Holub appears to have become more experienced as a hunter, and made large bags, procuring most valuable specimens for his collection. On one occasion, however, he was fairly worsted in an engagement with a herd of balloons.

Anxious to obtain a specimen of their species, I fired and killed one balloon; but, unfortunately for me, the creature fell into the river. At my second shot I wounded two more. This induced the right wing of the herd to retreat; but the main body kept their ground, and the left flank, moreover, assumed the aggressive, and commenced pelting us so vigorously with the stones that, remembering that I had only one cartridge left, I considered it far more prudent to withdraw than to run the risk of a hand to hand encounter. Accordingly, we retired, most ignominiously defeated.

Another incident which shows more than any other the dangers and difficulties of African travel was the loss of all his drugs and valuables by the capsizing of a canoe when the Doctor himself was on the eve of a serious attack of fever. This untoward accident brought his exploration to a close much sooner than he had intended, and was a source of great disappointment to him.

Dr. Holub's estimate of England is very flattering, but he thinks it far from desirable that Great Britain should extend her colonial possessions in South Africa. On the other hand, he deems it much better for the interest of trade and for the ultimate opening up of the continent that one or more Commissioners, duly authorized, should be maintained at the separate independent native Courts, arms and ammunition being, of course, excluded as articles of traffic. He pays a graceful tribute also to Colonel Warren, whose able administration and prompt measures saved the English colony of Griqualand West at a crisis of most terrible danger. An excellent likeness of the Colonel is given amongst the illustrations of the book. Seldom has such a journey been undertaken against such disadvantages, and few travellers have proved themselves more fitted for the task than Dr. Holub, whose tact and moderation, no less than his scientific knowledge and habits of observation, eminently qualify him for the work of exploration. He is about to return to the African continent, and it is to be hoped he will do as much time under conditions which will enable him to continue his great services to geographical science.

The pictures are not always accurately placed or described in the book. One, for instance, which is called "Hyenas among the Cattle," should be called an attack by wild dogs, *Canis pictus*, on the cattle; another animal which is described as a tiger is obviously a leopard. The work, however, is in every way a most interesting one, and a valuable addition to a library of travel.

#### LE CRIME DE SYLVESTRE BONNARD.\*

A FRENCH novel, which one can recommend to one's friends, of both sexes, and of all ages, is not so common a treasure that it should pass without remark. Perhaps M. Anatole France's story, *Le Crime de Sylvestre Bonnard*, is not, after all, a book to be recommended to readers of every taste. Students who may be led, by the title, to hope that Sylvestre Bonnard, Membre de l'Institut, committed some novel sort of crime, or revived some forgotten iniquity of Pompeii or Balaam, will be seriously disappointed. M. France's book, it must be admitted, will only interest persons who take pleasure in exquisite simplicity of style, in harmless wit, in delicate pathos, in the melancholy and humour of a happy old age. If Mr. Pickwick had written his own memoirs, our idea of him would probably be very different from the picture traced by Dickens. A great many deductions must be made before M. Sylvestre Bonnard, who tells his own story in M. France's work, can be described as a French Mr. Pickwick. When he travels, he does not lead about a band of Tupmans, Winkles, Bob Sawyers, and Benjamin Allens. In place of Sam Weller, he has an old tyrannical housekeeper, who has grown grey and dictatorial in his service. He is addicted, like Mr. Pickwick, to scientific studies; but his science has nothing to do with a theory of tittlebats, and is only ridiculous, as all science becomes ridiculous, when it is supplanted by something a little newer, and a little more true. But M. Bonnard's heart is like the heart of Mr. Pickwick, as young, as benevolent as his, and this impulsive organ at last leads M. Bonnard, as it led Mr. Pickwick, into a midnight raid against a school for young ladies. It is true that M. Bonnard had no dark lantern. But his escapade was successful, and, at the close of it, he, like Mr. Pickwick, is recorded to have run—a considerable athletic feat when a man is over seventy. Thus, in essentials, M. Bonnard is really a French parallel to Mr. Pickwick, though all the farcical element in the English hero's adventures is absent in the autobiography of the Membre de l'Institut.

M. Bonnard's memoirs are divided into two parts. The first tells the story of his chase after a desirable manuscript; the second is more romantic, and concerned with affairs of the heart. M. Bonnard, it must be said, was born about 1810. When he was a very young man, a pupil at the Ecole des Chartes, young men still said "enfer et malédiction" and wore velvet coats, and long hair after the manner of the middle ages. M. Bonnard's father had been in the French Admiralty, till he was crushed by the reception Napoleon gave to his

\* *Le Crime de Sylvestre Bonnard, Membre de l'Institut. Par Anatole France. Paris: Calmann-Lévy. 1888.*

report on the English navy, rather unfortunately presented shortly after Trafalgar. M. Bonnard's maternal uncle had fired the last French cartridge at Waterloo, and his portrait, that of a ranting, swearing, fighting Bonapartist, with all the military virtues and very few others, is admirably drawn. In his youth M. Bonnard had loved a young lady, who married a rich banker, named Noël Alexandre; but this only interests us at present as it accounts for the celibacy of the hero and for his exclusive devotion to the tasks of editing old French poets and writing a history of the Abbey of Saint-Germain-des-Près. M. France is himself a scholar, and a well-known editor of old French texts. The knowledge he has acquired in learned work serves him admirably in his delineation of the old student, a contemporary of M. Paulin Paris, a man who thinks that his life has not been spent in vain, because he has painfully added some tiny cells to the great coral island of our knowledge of the middle ages. The quiet melancholy of a man who has seen all his good days pass, who has grown grey and blind among books, and, at the end, finds his labours look so small, is one of the charms of this story.

M. Bonnard's first adventure, as we said, is his chase after a manuscript. In his bachelor's rooms he has a visit from a starving little colporteur of cheap books, who lives with his wife and child in a dilapidated garret at the top of the house. M. Bonnard sends the poor fellow some logs for his Christmas fire, does him other services, meets his beautiful wife on the stairs, and forgets the pair when the man dies and the woman goes away. At this time the old bibliophile's heart was set on a manuscript mentioned in the catalogue of the books of Sir Thomas Raleigh, an English collector. It was a fourteenth-century MS. of the Golden Legend, with additional chapters on Saint Ferréol, Saint Ferrutius, Saint Germain, Saint Vincent, and Saint Drocotové, with a poem on the miraculous burial of Saint Germain d'Auxerre. The legends, the poem, and the miniatures of the crowning of Proserpine, and of the Purification of the Virgin, were from the hand of the "clerk, Alexander." Now M. Bonnard, with his forty years' work at the history of the Abbey of Saint Germain, would have given all his economies for this manuscript. Eight years passed when a Florentine catalogue arrived, with an appendix on the whereabouts of various desirable books. In this appendix the manuscript of Alexander the Clerk was said to be in the collection of M. Polizzi at Girgenti. To write to M. Polizzi was, with M. Bonnard, the work of a moment. The answer came, M. Polizzi could not lend his treasure, but would show it to M. Bonnard in Sicily. The enthusiastic Bonnard at once set out for Sicily. In Naples he made the acquaintance of a beautiful Princess Trépoif, travelling with her husband in search of match-boxes, which they collected. They had obtained a unique suppressed match-box, decorated with heads of Mazzini and Garibaldi. But the wild Princess, who admitted that she sought in match-boxes nothing but oblivion of the past, was determined to go to Girgenti, where there was a local manufacture. On learning M. Bonnard's name, she cut him as rapidly as she had sought his acquaintance. The puzzled bibliophile met her again at Girgenti, where his simplicity and kindness won her wayward affection. The sketch of the Princess, with her caprices, her dissatisfaction, her real goodness of heart, is exquisitely drawn; and perhaps the finest passage in the book is the humorous description of the hunt for MSS. and match-boxes in the native city of Empedocles. Bonnard finds that the manuscript, with the miniature of the crowned Proserpine, has been sent to Paris, to the shop of Polizzi's son. He confides his woes to the Princess, who has been more fortunate in securing a match-box with a head of Empedocles. Finally Bonnard returns to Paris, tries to buy the MS. at an auction, is hopelessly outbidden, and despairs. But on Christmas Day a child brings him a huge *bûche de Noël*, which is opened and found to contain the card of the Princess Trépoif, a huge bouquet of violets, and the famous manuscript. The old house-keeper recognizes in the lady who drove the little boy to the house the widow of Cocoz, the starving colporteur. The Princess Trépoif, late the widow Cocoz, has not been ungrateful after all, though she did flee from M. Bonnard in Naples when his face recalled to her the old days of misery in a garret. A mere abstract of the incidents of the story can give no idea of the charm and brilliance of the writing.

An abstract, too, must fail to do justice to the second adventure, *La fille de Clémentine*. In this story M. Bonnard is a good deal older, verging on seventy. At the house of some friends in the country, he meets Jeanne, the daughter of his old love, Clémentine—of Clémentine who had married the rich banker, Noël Alexandre. M. Alexandre had died a bankrupt, Clémentine also was dead, and old Bonnard's heart was touched by the innocent unprotected youth of their child Jeanne. His story, which he tells with many digressions and with a pleasant garrulity, is often broken by reflections on his own learned old age. He was sitting one day in one of the public gardens, when he heard three young fellows, pupils of the Ecole des Chartes, discussing their studies:—

As-tu lu, dit Boulmier, la notice de Conrado?  
Bon ! me dis-je.  
Oui, répondit Gélis ; c'est exact.  
As-tu lu, dit Boulmier, l'article de Tapinay de Larroque dans la *Revue des questions historiques*?  
Bon, me dis-je pour la seconde fois.  
Oui, répondit Gélis, c'est plein de choses.  
As-tu lu, dit Boulmier, le tableau des abbayes bénédictines en 1600, par Sylvestre Bonnard?  
Bon, me dis-je pour la troisième fois.  
Ma foi, non, répondit Gélis. Bonnard est un imbécile.

So, poor M. Bonnard, who had just been secretly amused by the same young man's remarks on Michélet, went home with rather a heavy heart. His day was over. He had come, like all men of science, almost to the years when he seemed an exploded old impostor, a stumbling-block in the way of learning; and he remembered how, when he was a lad, he had laughed at some old contemporary mythologist, who had drawn up a catalogue of the lovers of Helen!

M. Bonnard naturally took a fatherly interest in Jeanne, the daughter of his old love Clémentine. But the unfortunate Jeanne, whose character is not quite that of a romp or of an ingénue, but whose courageous simplicity of nature is very well described, had fallen among thieves. She had for guardian a scoundrel of a lawyer named Mouche, and was a half-starved and greatly oppressed pupil teacher at the school of a Mlle. Préfère. As soon as Mlle. Préfère learned that M. Bonnard, who seemed interested in her pupil, was a member of the Institute, she made the most violent love to that unfortunate scholar. She brought Jeanne to visit him in his rooms, and there of course Jeanne met the repentant Gélis, who had changed his mind, and came to ask for the loan of books and for assistance in his studies. At length, in two most alarming scenes, Mlle. Préfère actually proposes to M. Bonnard, and introduces him as her betrothed to M. Mouche. What a position for a student of seventy years of age! Many, perhaps most, would have been frightened into matrimony and the arms of Mlle. Préfère. "J'ai quelquefois eu peur dans ma vie, mais je n'avais jamais éprouvé un effroi d'une nature aussi nauséabonde. Je ressentais une terreur écœurante," M. Bonnard explained himself with an explicitness which made further mistake impossible. He then fled away. But he now knew the nature of the people who had Jeanne absolutely in their power. Mouche, her guardian, ceased to pay for her board at the school. Mlle. Préfère treated her like Cinderella, locked her up alone and made her sweep the floor and serve in the kitchen. Learning all this, M. Bonnard conceived a simple but sufficient stratagem, abducted Jeanne, and thereby broke half a dozen articles in the *Code*, especially 356 and 357. When the nature of his crime was set before him, he defended himself but lamely, quoting from Baluze a decree of Childebert, at Cologne, in 593 A.D. He also referred to the ordinance of Blois, 1579, to a capitulary of Charlemagne, and to a custom of Brittany, suppressed in 1720. With these rules he was well acquainted, but he had never looked into the *Code*. Jeanne was left at the house of her friend, Mme. Gabry, and M. Bonnard retired to his criminal reflections. How he was saved from the consequences of his crime, how and in what studies he passed his latest years, what became of his library, and all about the future fortunes of Jeanne, must be read in his own memoirs, as edited by M. France. This latest editorial work of his may be less important to literary science than his previous labours, but has more general human interest than all the sixteenth-century French poems which he is likely to rescue from the limbo of manuscript.

#### VERRALL'S MEDEA.\*

THE classical studies of our Universities, which have of late years been reproached with decay, bid fair to take a new lease of life and activity under the influence of the modern scientific treatment of archaeology and philology. Two years ago we noticed the first instalment of a new edition of Pindar by Mr. Fennell, of which we shall be glad to see more. Now Mr. A. W. Verrall, who has already taken his preliminary canters in two extremely ingenious essays contributed to the *Journal of Philology* and the *Journal of the Hellenic Society* respectively, comes forward to show us how much remains to be done, and what he can do, with a play which is certainly not the least familiar among the works of the Attic tragedians. His readers will certainly be surprised, some of them may be shocked, at the number of new emendations of the text here proposed, amounting to thirty or thereabouts. The very familiarity of a text, however, may enable many things to pass muster which we should not allow to be genuine in a newly-discovered document. Nay, more, the popularity of a play like the *Medea* may have been a direct and potent cause of its corruption. We learn from the Scholiasts that the actors did to their knowledge alter the text in delivery now and then; and we may well suspect that there has been more work of this kind, beginning, perhaps, not many generations after the poet's own time, than the Scholiasts knew or could have known. Many of the variants commonly regarded as glosses may have been intended for the benefit of audiences, not of readers; many of the interpolations are hardly explicable on any other supposition. If we think of a manager in Gaul or Asia Minor producing an Athenian play for an audience incapable of catching a rare word or following the swift and subtle play of the genuine Attic dialogue, we can at once understand the natural results, and perceive that they are very much what we find in the existing text. Let the reader imagine, if he can, that for the text of Shakespeare we have to rely chiefly on transcripts made by half-educated persons in the eighteenth century from prompter's copies of the Restoration period. It is easy to see that the most popular pieces, such as

\* The "*Medea*" of Euripides. With an Introduction and Commentary by A. W. Verrall, M.A., Fellow of Trinity College, Cambridge. London: Macmillan & Co. 1881.

*Hamlet* and *Macbeth*, would fare the worst in this way. Those less in vogue, if preserved at all, would be preserved comparatively free from wilful tampering. Historical conjectures apart, Mr. Verrall has shown conclusively in our opinion that there is yet a great deal to be said on the text of the tragedians, and of this play in particular; and he has further shown that the reconstruction of corrupt passages may be undertaken with greater safety, though with greater apparent boldness, by modern philology than by the guesswork in which editors of the old school indulged. The scholar of this day is not satisfied with adopting a reading that makes sense and metre. The problem is not to fill up a blank with something the poet might have written, but to ascertain what he did write; and this is a question of fact to be determined by evidence, though the evidence is of a kind which only experts can give due weight to.

It is a very old canon of criticism that, as between an easier and a more difficult reading, the more difficult is to be preferred. The reason is that if the genuine reading presented nothing unusual, there was no temptation to corrupt it; whereas rare words or forms, unusual constructions, and unexpected turns of thought, are readily corrupted by glosses intended to explain them, by the mere blundering of scribes who do not understand them, or in the case of plays (as we suggest) by deliberate recension for the stage. The critical work of the modern school depends to a great extent on the detailed application of such reasons, enlarged by the greater range of modern philological knowledge. A simple and fairly common case is that we find two different readings, A and B, both acceptable in themselves, and given by authorities of about equal weight; but A, let us say, is a rare expression, B is a common one of the same meaning. Here we may be sure that A stood in the original and B is a gloss (or acting version?) which has displaced it. A case one degree less simple is that we find a reading B, which if it stood alone would excite no suspicion, and a variant *a* which in itself is inadmissible, as being repugnant to sense or metre, or both. Here, if we can see that *a* is an easy corruption of an original reading A, and that B would be a natural gloss upon A or offhand correction of *a*, we may restore A with nearly as much confidence as in the first case. Nor will it abate our confidence if A is a word very seldom found elsewhere; for it is just the words little known to comparatively modern actors and transcribers that are most exposed to corruption. Even if A is not otherwise known to exist at all, but is known by the analogies of the language to be possible, and would give an appropriate meaning in the text, we may be justified in hypothetically replacing it. And our hypothesis will of course be strengthened if we find that in other passages of the same or other authors the assumption of A as the original reading will restore sense and metre to a notoriously corrupt passage or clear up some serious difficulty. Mr. Verrall has more than once essayed this kind of reconstruction. Every such attempt must be separately judged on its own merits, and some of Mr. Verrall's will no doubt seem over-bold to the majority of scholars. But we are satisfied that the method is legitimate, and that it is better to err on the side of rashness in experiment than to spend labour in patching up forced explanations of grammatical impossibilities. In many cases the question is really of this kind—Is it more probable that an Athenian poet wrote something very poor and bald, and to be construed as Greek only by charity, or that he used an uncommon word which has not had the luck to come down to us, here or (it may be) elsewhere, quite undefaced? To resume, the distinguishing point of modern criticism as represented by Mr. Verrall is, as we said, that it is a science of observation and evidence. The old-fashioned scholar was quite happy if he made a conjecture which gave an acceptable sense, and was not wholly unlike some or one of the MSS. readings.

But the modern scholar does not allow these facile methods. He might say to his predecessor, in a quite possible case, something like this:—"True it is that your reading makes a pretty verse enough, and might have conceivably led to the existing reading *a*. But here are variants *b* and *c*, both of which are corrupt on the face of them, but neither of them explicable if your emendation had been the original. Here is a scholium difficult to understand with the text we have, and itself possibly corrupt, but showing, in any case, that what the Scholiast found in his text was something different from what you propose. And here, finally, is a reading (call it A) which does explain and harmonize all the facts. The variant *b*, which you rejected without consideration as mere nonsense, points, when we compare it with the scholium, to an archetype *x*, from which, by a slight correction, we have A. Then *c* becomes intelligible as a gloss upon A, and *a* is a corruption of some early scribe's emendation of a badly made copy of *x*. It is that old emendation, or something near it, not the original text, that your hasty ingenuity has replaced." The processes of corruption and restoration are happily illustrated in Mr. Verrall's Introduction by a demonstration on a few lines of *Comus*, which the critical reader should see and consider before he proceeds to pass judgment on the editor's dealings with the *Medea*.

We may now select for particular mention some of Mr. Verrall's emendations. On v. 32 he suggests *ἀφίκετο* for *ἀφίκετο*, which would be, as he says, "a clear improvement" at the cost of very slight change. A few lines below (39) we agree with him that *ἐγὼ δὲ τῆδε*, "I know that woman's character," is not Greek. The restoration of the adverbial *τῆδε* makes all straight. The common reading of 157, *κίνεα ῥόδε μὴ χαράσσω*, "do not be angry with him for it," is inappropriate and already under suspicion. Mr.

Verrall reads, again with a trifling change of letters, *κινῶν ῥόδε μὴ χαράσσω*. "The case is common; be not wounded." V. 234 is emended so as to give an improved sense on the hypothesis that a repeated word has dropped from the beginning, and the MS. readings (none of which is admissible) represent confused attempts at filling the gap. In 668 there is a conjecture which we think all but certain, and which is a good example of Mr. Verrall's method. The line (addressed by Medea to Ægeus) is, as commonly read,

τί δ' ὀμφαλὸν γῆς θεισιφρόν ἐστάλῃς;

Now *ἐστάλῃς* is the reading of one class of MSS., generally accounted the best, and in itself is acceptable. But other MSS. give *ικάνεις*, an impossible reading, which no copyist can have derived from *ἐστάλῃς* by any process we can imagine. The word, moreover, is a much less common one. On the other hand, *ἐστάλῃς* is just such a correction as would be made by an intelligent copyist who found *ικάνεις*. Dismissing it, therefore, as a mere conjecture, Mr. Verrall extracts from *ικάνεις*, by the change of one letter (Z for K), the original reading *ικάνεις*, which is far more pointed and appropriate than *ἐστάλῃς*. The meaning is, "Why did you sit as a questioner at the oracle?" In 737-739, a passage admitted on all hands to need some correction, Mr. Verrall's reading—

λόγους δὲ συνβῆς καὶ θεῶν ἀνώμοτος  
ψιλὸς γένοι' ἂν κύπτηρυκέματα  
οὐκ ἀντιστοίχοι.

gives a happy result with no violent change; the innovations are *ψιλὸς* for *φίλος*, and *ἀντιστοίχοι* for *ἀντιπαῖδες*; as for *κύπτηρυκέματα*, it is shown by the scholia to be older than the *κύπτηρυκέμασιν* of our present texts. The sense is:—"If you agree (not to give me up) in words only, unbound by oath, you will be defenceless, and unable to stand on equal terms against my enemies' demands." This is exactly what the context points to, but previous conjectures fail to supply. Another ingenious emendation of much the same kind is offered on vv. 909, 910, where we have hitherto read:—

εἰκὸς γὰρ ὀργὰς θῆλυ ποιῆσθαι γένος  
γίμους παρεμπολῶντος ἀλλοίους πόσει.

Editors have seen that this cannot stand, for the genitive absolute in this position is intolerable, and *ἀλλοίους* unintelligible, even if the word occurred elsewhere in the tragedians; but nothing satisfactory has been proposed. Mr. Verrall reads *παρεμπολῶντα συλαίους*, accounting for the corruption by the stages—*συλλαίους* (A being doubled by mistake, a thing otherwise known to happen in the very word *σύλη*)—*συλλαίους*—*σαλλοίους*. The word *συλαίος* (from *σύλαι* in a known special sense) would mean *liable to be seized as a prize*, contraband. Mr. Verrall translates, "For it is natural in the sex to show ill humour against a spouse when he traffics in contraband love." In v. 1346, where the vulgate—

ἔρρ', αἰσχροποιὶ καὶ τέκνων μαίφονε—

is doubtful as Greek, and pointless vituperation at best, Mr. Verrall gives *τέχνην* for *τέκνων*, a mild remedy, which is amply justified by its effect:—"Go, artist in villany" (*αἰσχροποιὸς* is analogous to *ἀνδριαντοποιός*, &c.) "and murderess by trade!" In 1194 he reads *ἐλάττετο*—lapped up, devoured—for the more than doubtful *ἐλάμπετο*, which in Attic should mean, not "blazed out," as it here has to be rendered, but "was illuminated." In 1184 he ventures on introducing a compound verb of whose existence there is no direct evidence; but his reasons cannot be explained in a shorter compass than that of the rather long note which is devoted to them. At v. 1243 a feeble and suspicious line (as it stands in the common text after a grammatical correction made by Elmsley) has been most ingeniously recast; but this conjecture, again, depends too much on the nature of the context to be exhibited here. Mr. Verrall's note on 1317, where he lets the text stand, is very characteristic of his work. The line itself—

τί τίσθε κινεῖς ἀναμοχλεύεις πύλας—

is free from difficulty. But Aristophanic and other allusions point, as Mr. Verrall judges, to some unusual word of which *πύλας* is a gloss, more or less resembling *ἐπη* in sound. This word, he suspects, was *ὄπας*; if Euripides used *ὄπη* as a rather daring poetic word for the lock of a door, we understand how there was a handle for parody, and Aristophanes' *κινῶν ἐπῶν* (for *ὄπῶν*) *κινητὰ καὶ μοχλευτὰ* is at once fitted with its original point.

It must not be supposed that Mr. Verrall's criticism is always innovating. To our mind it is conservative in the best sense, as diligently seeking out even obscured evidences of what the author wrote and meant, and not letting explanations which are tempting by their apparent simplicity pass without strict proof. But it can also be conservative in the literal sense. There is one passage in a chorus (v. 836) which Mr. Verrall restores to a satisfactory condition with decidedly less departure from the MSS. than any other editor. Nor must it be supposed (and perhaps this is more important) that Mr. Verrall's edition is a performance of mere verbal scholarship. On the contrary, it is an example of modern scholarship as opposed to the kind of learning which was merely verbal. Not only the reading and grammatical interpretation of the text, but the dramatic points, the finer shades of meaning, and the possible allusions to contemporary events and controversies, are carefully noted and worked out. Modern languages and literature are freely drawn upon for illustrations, and a parallel passage is even adduced from *Lohengrin*, which to a commentator of the older school would have appeared unpardonably frivolous. As specimens of Mr.

Verrall's illustrative work we may just refer to his remarks on the peculiar ethical meaning of *μακάριος* (as want of feeling or consideration, not mere intellectual ignorance), in Attic literature; and on the Euripidean use of *βίος* in the special sense of wealth, luxury, and of *ἡσυχία* to denote the character of a man of learning as almost equivalent to *σοφία*. Mr. Verrall connects the passages where this last-mentioned word occurs with an ingenious hypothesis as to Euripides' connexion with the Ionic school of physics already propounded by him elsewhere.

Finally, we shall hazard two remarks of our own on the text. In vv. 401-403, we read:—

ἀλλ' εἰς φεῖδον μὲν ὧν ἐπίστασαι,  
Μήδεια, βουλεύουσα καὶ τεχνωμένη·  
ἐπεὶ ἐς τὸ θανάτῳ νῦν ἄγων εὐψυχίας.

The middle line of these three certainly adds nothing to the force of the passage, and is in strange contrast with the concise and even abrupt character of the context. We grievously suspect it to be the work of an interpolator who thought Euripides had not made it sufficiently clear that Medea was speaking to herself. Then in the speech of the messenger, describing the success of Medea's vengeance, which is full, be it noted, of unusual expressions, it is said of Creon's death (v. 1218):—

χρόνῳ δ' ἀπίσβῃ καὶ μεθ' ἧς ὁ δῦσμορος  
ψυχῇ.

*ἀπίσβῃ* is Scaliger's certain correction for *ἀπέστη*. But is there nothing else amiss? *χρόνῳ*, "at last," is commonplace, and not appropriate in this context. Medea's poison worked not slowly, but swiftly, as we know from the rest of the speech. Now Mr. Verrall himself has shown elsewhere strong reasons for assuming the existence of an old word *χράνω* (akin to *χραίνω*, as *χάρος*, itself a rare but known word, to *χαίρω*), meaning *filth, pollution*. What if Euripides wrote here *χράνῃ δ' ἀπίσβῃ*, "his life was quenched in foul poison"? The sense, we think, would be more forcible than the existing text, and much more in accordance with the general character of the speech; and the corruption (or supposed correction) to *χρόνῳ* would be a matter of nothing less than certainty.

#### SOME BOOKS OF GEOGRAPHY AND TRAVEL.\*

THE Geography which Mrs. Lang has undertaken for Messrs. Rivington, under the editorship of the Rev. M. Creighton, and of which this volume is the first part, is on a somewhat different plan from any other with which we are acquainted. In taking the British Empire as a whole instead of considering its separate parts as they occur in a survey of the different continents, it may have had some predecessors; but none of these, we think, has attempted the subject quite in the same way. Mrs. Lang has neither adopted the catechism form nor the gazetteer form, but has made what may be called a kind of narrative of her book, a narrative divided into chapters and sections, partly according to physical, and partly according to political, divisions. The book is particularly well illustrated by bandy maps, which adjust themselves to the divisions in the text, and thus make it self-contained. This, for lazy and unintelligent children (and the majority of children are both lazy and unintelligent), is a matter of considerable importance; and, even to those who are neither one nor the other, this grouped account of the whole Empire will probably give a much clearer idea of it than they would be able to manufacture for themselves out of the scattered materials supplied by the usual geography. The style is familiar without the elaborate puerility which some late writers have affected, and the author has shown commendable diligence in meeting the exceedingly difficult problem of deciding what is and what is not the British Empire under Mr. Gladstone's Government. The case of the Transvaal has been adroitly met. On the other hand, it is almost unavoidable that in such a conglomerate of statements about matters of fact, each of which is necessarily concise, some slips in the matter of strict accuracy should occur. Harrogate is not on the Wharfe; Stamford is not in Northamptonshire. That the Channel Islands have "an English governor and a House of Assembly" is incorrect, for there are two governors and two Houses of Assembly entirely independent of each other. "The cows for which Alderney is celebrated," and which, according to Mrs. Lang, "are reared on the tableland of that island," are for the most part excusable creatures of her imagination. The said tableland is not much larger than a tablecloth; and "Alderney cows" is a conventional misnomer for Jersey and Guernsey cattle, which has the advantage of not hurting the feelings of either of the larger islands. These are not matters of much importance, however, and can be easily corrected in the future editions of what is likely to be a very useful book. It is one of the best specimens which we have seen of the new school

books, in which the aim is not to provide something craggy for the mind to exercise itself on. Some of us may regret the cragginess, but that is another matter.

Mr. Stanford's capital series of County Guides has received two additions, Somerset and Hampshire. Both counties are capital examples of what may be called the average English county, which has no particular show district (unless an exception must be made for the New Forest in the case of Hampshire), and which yet is full enough of objects of interest to occupy any intelligent traveller, whether on foot or not, for weeks and almost months. Both Mr. Worth and Mr. Bevan are old hands at this kind of work, and they do it in a thoroughly workmanlike manner. Perhaps Mr. Worth has a little the better in the archaeological department (though it must be admitted that he is fortunate in having the excellent proceedings of the county Society to quarry from). Mr. Bevan, on the other hand, is rather more precise in his pedestrian directions. We should have been glad, however, if the space which is taken up in the Hampshire Handbook by an inadequate sketch of the Isle of Wight, which, after all, obliges reference to be made to another volume of the series, had been given to the New Forest, which is rather summarily treated. A map of the latter on a larger scale would moreover have been a more useful thing than a plan of Winchester Cathedral, and in the same way the plan of Wells Cathedral would have been advantageously exchanged for a plan of Bristol, which is quite large enough, and labyrinthine enough, to require one. The general maps of the counties are also on too small a scale to be of much practical use. These, however, are all the faults that we can find, and some of them are faults for which the authors cannot be justly held responsible. In judicious choice of routes, in thoroughly quartering over the ground, and in abundance of detail about each place mentioned, the two volumes more than keep up the credit of the excellent series to which they belong.

The *Book of British Topography* is of a kind which rejoices the heart of all persons who have to do with books; the kind where a writer condescends to take a subject which he knows thoroughly, which is definitely manageable, and which, if handled properly, cannot fail to be a useful contribution, if not exactly to literature, at any rate to the state of things which makes literature possible. What Mr. Anderson has done is to give a carefully classified catalogue of all the topographical works relating to Great Britain and Ireland which are contained in the Library of the British Museum. The classification is in the main by counties, with an opening section of general topography, subdivided according to subjects. The county divisions are in their turn subdivided under towns, &c., and there is an alphabetical index of all the headings at the end. For convenience and thoroughness this plan appears to be excellent. Mr. Anderson estimates the number of his entries at something like fourteen thousand. It is, of course, to be understood that the book is a catalogue of topographical books to be found in a particular library, and not of British topography in general, though it could easily be made a basis for the latter by the simple process of interleaving. It is only to be regretted that similar catalogues in reference to other special subjects are not more generally undertaken, either by officials or frequenters of the British Museum. In point of practical use, they would far exceed the long-expected and at last promised printed general catalogue.

Mr. Baness, who is chief draughtsman of the Indian Survey, has provided in his *Index Geographicus Indicus* a book which is beyond all question useful, but which labours perhaps under a certain complexity of plan. The only part of the book which literally answers to the title is contained in rather more than a hundred pages, numbered in Roman numerals at the end of the volume. The *Index* is somewhat technical in character, and at first sight such an entry as the following—

Biswan T. and S. D., Sitapur Dis., Oadh, N. W. P.

may remind the unlearned reader rather painfully of the clear-stores towards the south north which were as lustrous as ebony. Mr. Baness has, however, provided due tables of abbreviations, &c., for removing this difficulty. It may be added that, as he has carefully adopted the new orthography, his book is very useful to old-fashioned readers of new-fashioned books, who may not at first recognize the language of the latter. The earlier and larger part of the volume serves to expound this Index, and is a most laborious compound of gazetteer, geographical, dictionary, atlas, and official guide. The provinces, agencies, &c. are taken in turn; their official establishments are given with statistics of all kinds, with a brief general description of each, and an abundance of illustrative maps. The possessions of foreign countries in India, the outlying independent States, the islands, &c., follow. Nor is Mr. Baness satisfied even thus, for he appends various illustrative sections, the most important of which is a brief general description of the religions and peoples of India. This last is, perhaps, an instance of well-intentioned, but somewhat mistaken, energy, for the thing cannot be done in the space. Nevertheless, Mr. Baness has unquestionably provided the most complete book in a moderate compass that has yet appeared on the subject.

The late Major Upton's *Gleanings from the Desert of Arabia* belongs to what might on a very elaborate system of subdivision be called zoological geography. The author's acquaintance with Arabia was limited to the Syrian desert in the neighbourhood of the Euphrates, and the purpose of his visit was also limited and peculiar, being the study and purchase of Arab horses. In carrying out this purpose, however, he had advantages for the study of the Bedouin, as well as of their horses, superior to those of almost

\* *Geography of the British Empire.* By L. B. Lang. London: Rivington. 1881.

any recent travellers except Lady Anne Blunt and her husband. He lived for days in an encampment of the Sabaah Anazeh, and was specially favoured by the sheikh of that tribe or sub-tribe, as well as by Jedan Ibn Mahaid, the head of another still more important clan. He is at least as enthusiastic for the sons of the desert as Mr. Blunt, and has some useful remarks about the relations and position of the northern tribes. His description of the residence at Aleppo which preceded his desert journey are also vivid and good, though (perhaps because) they are entirely devoid of the least pretence at deliberately literary treatment. But, as has been said, the horse, and not his rider, is Major Upton's main subject. He devotes the most elaborate reasoning to the discussion of the mysterious problem of "Al-Khamseh," the five historical or mythical mares from whom the crack breeds of the Arabian horse are supposed to descend. Into these intricacies we cannot follow him here, and it is possible that ordinary readers will be inclined to skip them even in the original. They will find, however, plenty of matter of a less technical kind to interest them. Major Upton fully confirms the opinion of those who maintain that mares, and still more horses, of the pure Keheilan blood very seldom come to Europe. He believes himself to have secured no less than five such, testified to by the two sheikhs already mentioned. There are some curious stories here which thoroughly confirm the legends of the extraordinary affection of the Bedouin for their horses, and of their reluctance to part with them. Although the visitor had gone to the tents of the Sabaah expressly to deal, though mares and horses had been freely brought for his inspection, and though there was no haggling at the price, the owners constantly cried off at the last moment, until Major Upton, as if offended, ordered his tent to be struck and threatened to set off at once. This slight on the hospitality of the Bedouin at once brought them to reason. Even then the owners of the horses bought frequently required all the persuasion of the sheikh to accept their price, and constantly appeared to regret the bargain. A more signal instance both of this affection and of the strict chivalry of the people is a story which rests, not, indeed, on Major Upton's own authority, but on authority apparently good. A European doctor and his companion were attacked in the desert, and the companion shot the chief robber's mare. Immediately the Bedouin burst into tears and embraced the dead animal. But it seems that the etiquette of desert raiding, which permits robbery but forbids murder, was strictly observed, and that the plundered slayers of the precious mare were allowed to depart uninjured. The story is all the more remarkable, that Major Upton only relates the facts and does not draw the full moral. His book ranks with Mr. Palgrave's, Lady Anne Blunt's, and a very few others, as a document for the standard account of Arabia which somebody will have to write before long.

## TOO RED A DAWN.\*

THE plot of this story is of a common enough order, one moreover that can be easily understood and easily described. The heroine—a virtuous young lady—falls in love with an attractive but most pernicious villain, and rejects the suit of a staid but devoted lover. In the end the villain is unmasked and rejected, and the virtuous lover succeeds in his suit. It is, after all, the old story of the naughty boy who put poor Pussy into the well, and of the good boy who fished her out; with this difference, however, that in the present case poor Pussy's life is saved. In novels of this kind it too often happens that to the heroine, as to the cat, assistance comes too late, and that she is not freed from her oppressor till she is on the point of breathing her last gasp. Happily the heroine of *Too Red a Dawn*—Miss Merril Hamerton—is of so uninteresting a nature that we do not trouble ourselves for a single moment about her fate. So long as we could see the last of her we should, we felt, be quite satisfied, whatever might be her end. Her virtuous lover and cousin, the faithful Dick Hamerton, was as stupid even as she, while the villain, Arthur Wansy, was as dull as villains usually are. The story opens impressively enough. A carriage drives up to a large house close to Kensington Gardens. A gentleman and lady get out of it. "The coachman drove away to the stables, for Mr. and Mrs. Hamerton were now at their own door. They passed arm-in-arm out of the chilly atmosphere into one of the most beautiful houses in London; and that house was their home." It would have seemed to follow that, if two people were at their own door and then entered the house, that the house that they entered was their home. But Miss Mabel Collins is not one to leave anything to her reader's imagination, and perhaps she can be easily justified in this. For, in the first place, what is left to the imagination of a reader of such novels as hers is likely enough left to what does not exist; and, in the second place, whatever is so left does not of course in the least help the writer to fill up a single line of her three volumes of three hundred pages each. To return, however, to our heroine's parents, whom we have carried not only through their own door, but also into their own house. They were, we are told, "what we call fortunate people; their lives were full of the luxury of wealth, of the colour of art, of the charm of love." They kept a coachman, and a butler too, if we are not mistaken. Their stairs were broad

and soft-carpeted. Their house was warm with beauty and stately with art at every turning. She was dressed in a curious robe of some dim yellow-coloured material, and he derived delight from the pictures of Pietro Perugino. Whether he also observed, whenever he saw a picture, that it might have been better if the painter had taken more pains, that we are not told. It was satisfactory, at all events, to discover that he strictly adhered to one of the two rules on which is based the art of a *cognoscente*. "Everything," we further read, "which immediately surrounded them was softened by their own atmosphere." Hitherto we had thought that that which immediately surrounds us is our own atmosphere; but to this word our author attaches either a meaning of her own or no particular meaning at all. Thus, in the third volume we read of the "deadly chill of Arthur's altogether unemotional atmosphere." The parents having gone up the stairs, "with that careful step which does not mean fatigue, but the leisureliness of enjoyment," passed into the drawing-room. She takes up the third volume of a novel which she had brought with her from the library. He thereupon begins a discourse on love, and talks of the deathly embrace of the ivy. Why he should not talk English, and say deadly, we do not know. Perhaps he had been dipping into his wife's novels, and had picked up a few fine and foolish terms from them. He goes on to talk about "love which is the ripened wealth of the soul." She, we may well believe, wished that he would hold his tongue, and let her get on with her third volume. He quotes poetry; she says "the lines are perfect, but how they chill one!" Just then the most beautiful thing in that beautiful house flashed out upon them. It was the face of their own child Merril. Who was her godmother, and how the girl got the name of Merril, we never learn. We scarcely dare to laugh at it as affected and absurd, for doubtless we shall be told that it is an English name, and was in common use, at all events, up to the close of the last century before the Norman Conquest. Soon after this the villain enters, a broad-chested, handsome young fellow, who lived next door, and who "pervaded the Hamertons' house." About him the fond mother has, she says, "a presentiment that, if any trouble comes into our darling's life, it will be through him." In this presentiment the reader at once shares. In fact, in all such cases it is Sir Toby and Sir Andrew over again. "I smell a device," says Sir Toby the author; "I have 't in my nose too," cries Sir Andrew the reader. The two young people, however, seem as far away from harm as possible, and they go out to see the skating. For a moment we feared that by his imprudence she might get drowned, but we were encouraged not only by the severity of the frost and the thickness of the ice, but also by the thought that we were only in the first chapter of the first volume. The author takes advantage of the absence of the young people to describe the father—not that fathers need in themselves any description, for they are a heavy sort of people at best—but she gets an opportunity of some very pretty writing. He had "just that touch of coming snow upon his hair which is more beautiful about a face on which experience has placed its mark than any golden aureole." From this description of him we come back to a description of his drawing-room. He maintains that he and his wife appreciate what other people do. His wife looks around her—"Certainly the evidences of a capacity of appreciation were all about her." The young people return. The mother sits in a chair which was a perfect example of Byzantine art. Its cushions were of satin, great and yellow, while she herself was in the curious robe of some dim yellow-coloured material which we have mentioned before. Her daughter was covered with seal-skin, so that only her bright young face flashed out. But the furniture and the ornaments of the room and of the house we must leave to the pages of the book. We must not, however, pass over the mother's watch—"a tiny thing, studded with jewels, but which, nevertheless, kept time." Presently they all fall to drinking tea. The chapter closes with their driving off to a dinner-party beneath a depth of furs.

Very different was the home of the wicked Arthur. His parents had no atmosphere of their own to soften all that immediately surrounded them, neither were there all about them the evidences of a capacity of appreciation. Everything, indeed, in their house was of the very best, the handsomest, the heaviest. The description given of it reminds us of Mr. Osborne's house in *Vanity Fair*, and the owner of it is, indeed, a very indifferent copy of that gentleman. The son, however, "had been trained up to the standard of Oxford aestheticism," whatever that may be, and was, it would seem, likely enough to win the affection of even a most virtuous and simple-minded girl. The young people get very quickly engaged, but the dawn, as the reader admits, is indeed too red to give promise of a fine day. Just about this time Cousin Dick appears upon the scene. He, poor fellow, was deeply in love with the heroine, but he had been so sadly behind the forwardness of the age that he had never allowed her to discover his secret. It must have been a great blow to him, we should imagine, when he saw how much she admired his rival, as "he performed the backward roll and other occultisms (*sic*) of skating." Happily, Dick had just left her father's sanctum as a day or two later she invaded it, with her thoughts full of her engagement. "Her face was aglow—it was like the advent of a living flame, the entrance of that sunny child." Only twelve pages earlier she had been rather too much of a living flame. She had gone to a party after Arthur had proposed to her, but before she had given him her answer. She

\* *Too Red a Dawn*. By Mabel Collins. Author of "An Innocent Sinner," &c. 3 vols. London: Tinsley Brothers. 1881.

suddenly caught sight of him, and with great propriety felt faint. "I think the room must be very hot," she said to her anxious mamma. That good lady urged her to go down to a cooler air, and, utterly unaware that it was Arthur who had caused her agitation, sent the two young people together. "It was like," says our author, "thrusting a scorched hand into a furnace." No wonder, then, that the very next afternoon the young lady's face was like the advent of a living flame. Matters go on pretty smoothly for a time, but the wicked lover gets into company as bad and repulsive as it is utterly dull. We have stupid descriptions of one coarse woman who was always smoking cigars, and of another coarse woman whose hair was like yellow silk, and glittered like gold in the firelight when she threw it behind her. By the way, though she threw it behind her, it does not seem to have been a wig. Merril has her friends too, who, though respectable and virtuous, are as dull as if they were vulgar and vicious. She knows a poetess, who says to her, "Human nature is your colour-box," but who unfortunately has dangerous views on religious matters:—

My individuality is of no value; I try not to realise myself. All I want is to learn how to create the beautiful, and so I shall gain all of immortality that is possible by leaving something beautiful behind me when I myself exist no longer. And I am most content when I hardly believe I am individualised. If our future is absorption into the universal life, it seems to me that it is best to approach as near as possible to that state now.

The poetess goes on ranting for a page or two more, and contrasts her unhappy fate with Merril's happy lot. Wherever the heroine stepped there was green grass, while "I too often," she exclaimed, "touch a shrieking flower, and start back aghast at its voice." At last, apparently, she returns to her senses, and for once gives good advice. "Merril," she exclaimed, "forget every word I have said." By the beginning of the second volume the poetess gets married in a dress that was made of a piece of Indian muslin, while Merril as a bride-maid was a milliner's triumph. The sudden sight of Arthur called a transforming glow into her face, and she was at once in a witch-like mood. The bride all the while seemed like a pale dream-lady, bringing with her the intense fragrance of a land of flowers. But then her veil was held by clusters of flowers, and the spring day had a wealth of flowers, and the altar was covered by a glory of flowers. Before long the hero gets into debt and dreads exposure. "Should he now formulate (*sic*)," he asks himself, "the desperate idea which sheer boredom and rebellion had been harbouring in his mind, and go away, without running the risk of facing this affair?" Apparently he does formulate the idea, and he disappears in such a manner as to make every one believe that he had been drowned. The heroine nearly dies of grief; but she is saved by the poetess, who goes to see her, flings herself upon the foot of her couch, and by a quick serpentine action draws herself up, so that she lies straight at Merril's side. There she revived her apparently dying friend by that "glow which appears to descend from the emotions of the soul into the sensations of the body." Before very long Merril informs every one that Arthur is not really dead, as she has dreamed more than once that he is alive. She convinces no one but the reader, who, from long experience, places the fullest trust in the dreams of a heroine. The villain at the end of a volume or so returns, and shakes hands with her. But "no magnetic current rushed between them," and she saw at once that their love was a thing of the past. His father was by this time on his death-bed, but the wicked son hopes that he is not too late to be named in his will. The old gentleman, however, screams out that he shall not have a shilling of his money, and falls back dead. Merril was present, and "the words of that dying curse enlightened her scorchingly, like a flash of lightning." She had begun by being like a scorched hand thrust into the furnace, she had next had a face that was like the advent of a living flame, and now she was enlightened scorchingly. Before long, of course, she becomes Mrs. Dick Hamerton, and the reader, to his great relief, sees the last of her.

#### LORD HERBERT OF CHERBURY'S POEMS.\*

IN a passage of unusual vigour, which we do not doubt is known to so omnivorous a reader as Mr. Churton Collins, the dramatist Rowe remarks

As foolish parents on their offspring date,  
Each idiot author loves the brat he got—

a sentiment which we often feel inclined to expand, in prose, by adding, "and each judicious critic the mouldy old author whom he was the first to discover." It was in the second volume of Mr. Ward's *English Poets* that Mr. J. C. Collins originally obliged the town with extracts from the poetry of Lord Herbert of Cherbury, which he claimed, and very justly, to be the first to rescue from oblivion. He prefixed to those extracts a little essay, in which he said much more enthusiastic things of Edward Herbert than Mr. G. A. Simcox found himself inclined to say, a few pages onward, about the verse of the younger brother, saintly and tuneful George Herbert. Mr. Collins claimed for the author of *De Veritate* a "place among English poets," and "vindicated" that claim by some of the strong stock phrases of laudatory

criticism. The scope of Mr. Ward's volumes naturally restricted his space for selection, and so Mr. Collins could only "vindicate" his claim for Lord Herbert by the quotation of two fragments. These struck us as rather dull and affected copies of verse in the customary manner of the day, and we reserved our opinion until we should see more of these very rare and forgotten poems.

We have, however, had very little time to wait. Mr. J. Churton Collins has followed his little prelude in *The English Poets* by reprinting, with an eloquent critical introduction, the whole of the work in question. *The Occasional Verses of Edward Lord Herbert, Baron of Cherbury and Castle-Island* is an exceedingly scarce little book, published in 1665, seventeen years after the death of its author, by his son Henry Herbert. We can easily understand that Mr. Collins should be startled at finding these poems completely neglected, and should hasten, with the fondest hopes, to peruse them. But what surprises us, after ourselves reading the text of the *Occasional Poems*, is that so instructed a critic should have been able to persuade himself that they were worthy of republication. We have a singular patience with bad old verse; we can read Churchyard with satisfaction, and Chamberlayne's *Pharronida* with a slight, but distinct, romantic flutter. We think there is a great deal of merit in Breton, and that Warner deserves republication. But the most catholic reader must draw the line somewhere, and we draw it at the poems of Lord Herbert of Cherbury. Among the instances of great men who have never learned their real function in life, there is not a more curious instance than this of the precise and upright author of the *Expedition Buckinghami* conceiving himself to be a poet. With all his knowledge of the human heart, with all his tact and culture, Lord Herbert is as commonplace, tuneless, and even clumsy where he attempts numbers, as the veriest numskull who ever set two rhymes together.

But let us listen to Mr. J. Churton Collins. "Lord Herbert," says this accomplished advocate, "has in a large measure grace, sweetness, and originality." To judge whether this is true or not, we take an example, not from any piece of our own choosing, but from one which Mr. Collins has himself picked out for special commendation. The subject is one of great originality; it is an address "To Her Hair," and here is an instance of the peculiar grace and sweetness with which Lord Herbert approaches this novel theme:—

Lighten through all your regions, till we find  
The causes why we are grown blind,  
That when we should your glories comprehend,  
Our sight recoils, and turneth back again,  
And doth, as 'twere in vain,  
Itself to you extend.

Every ingenuous reader must admit that this, so far from displaying grace and sweetness, is as clumsy and harsh as verse well can be. Mr. Collins proceeds to say that Lord Herbert's "versification is, as a rule, far superior" to that of Donne and Cowley; "it is as uniformly musical, and his music is often at once delicate and subtle." This is extraordinary praise, since we all know that the verse of Donne, though whimsical to distraction, is, at its normal height, of a thrilling and mysterious beauty almost unrivalled, except by the five or six greatest masters of English prosody. We might look forward to Lord Herbert's poetry with delight indeed, if his versification were "far superior" to that of the writer of

When by thy scorn, O Murderess, I am dead,  
and of

I long to talk with some old lover's ghost,  
Who died before the god of Love was born,

and, it seemed, we might expect to find it "uniformly musical," which alas! is more than can be said of Cowley's or of Donne's. Here, however, in one of the most prominent pieces, is an instance of this uniformity of Lord Herbert's music. It is a love-poem to the mind of his mistress:—

Exalted Mind! Whose character doth bear  
The first idea of Perfection, whence  
Adam's came, and stands so. How can'st appear  
In words that only tell what here-  
Tofore hath been?

This is a very good average specimen of Lord Herbert's versification.

Lord Herbert of Cherbury, as revealed to us in this his only volume of verse, is a good example of the typical Jacobean poetaster. In the reign of Elizabeth the genuine golden music was so widely diffused that even the obscure singers who abridged once and once only in the dingles of some "Paradise" or "Gallery" of miscellaneous poetry, contrived to catch the echo of a veritable melody, but in the second or silver age of James the poetasters were more voluble and less lucky. About 1620 it was possible to write in a very execrable style. Herbert, whose mother was Donne's intimate friend, and some of whose poems are dated as early as 1608, was one of the very first to imitate the strange ingenuities of Donne. How helplessly he follows Donne, and with how nerveless a tongue, may be well exemplified in this "Madrigal," which we also quote in justice to Lord Herbert, as being probably the best of his serious pieces:—

How should I love my best?  
What though my love unto that height be grown,  
That taking joy in you alone,  
I utterly this world detest.  
Should I not love it yet as th' only place,  
Where Beauty hath his perfect grace.  
And is possess?

\* *The Poems of Lord Herbert of Cherbury*. Edited, with an Introduction, by John Churton Collins. London: Chatto & Windus.

But I beauties despise,  
You, universal beauty seem to me,  
Giving and showing form and degree  
To all the rest, in your fair eyes.  
Yet should I not love them as parts whereon  
Your beauty, their perfection,  
And top doth rise?

But even myself I hate.  
So far my love is from the least delight,  
That at my very self I spite.  
Senseless of my happy state,  
Yet may I not with justest reason fear,  
How, hating her's, I truly her  
Can celebrate?

There is more in the same style, but we have inflicted enough upon our readers. The only interest of the stanzas is to show how an unskilful versifier could take a mellifluous ingenuity of Donne's and thoroughly spoil it. The lines just quoted are almost entirely unintelligible to any one who does not carry in his memory the famous

Sweetest Love, I do not go  
For weariness of thee,  
Nor in hope the world can show  
A fitter love for me;  
But since that I  
Must die at last, 'tis best  
Thus to use myself in jest  
By feign'd death to die.

When we turn from the verses of Lord Herbert of Chesham to Mr. Collins's critical introduction we do not find much to commend. It is written with a less genuine enthusiasm than the same editor's introduction to the works of Cyril Tourneur, as, indeed, is natural; and we cannot but think that the bastard Macaulay manner, one of the worst possible, is growing upon Mr. Collins. This is surely a very unpruned style in composition:—

Never since Jerome Cardan laid bare for the world's inspection the innermost secrets of his being, never since Cellini told the story of his strange vicissitudes, never since Montaigne took Europe into his confidence, had such a record as Herbert has left us been committed to paper.

This seems to us like saying that never since four o'clock did the cat lap milk until seven o'clock, except when she lapped it at five o'clock and at six o'clock; for why state that no such record had been left since Cardan's, if the same is immediately to be said of Cellini's and of Montaigne's? The only sense in which this form of speech could be taken as meaning anything would be as a statement of the absolute simultaneousness of the authors, that is, that Montaigne and Cellini and Cardan took the world into their confidence at the same moment. But this is not borne out by history. Such vagaries as these are the result partly of straining after eloquence and a massive style, and partly, no doubt, of an embarrassing consciousness that the case in hand is not strong enough to rest on its own merits unadorned. Mr. Collins writes with so wide a knowledge of literature, with so sincere a love of it, and with so much gusto for unexplored regions of its poetic province, that we would gladly see him expending his powers on better work than defending against all hope the indefensible poems of Lord Herbert of Chesham. It would be a labour far more worthy of his skill and taste to edit for popular readers the famous prose *Autobiography* of his favourite, a book of which, he says, not more pointedly than justly, that "it is the portrait of a man with features eminently striking and peculiar, whose ways were never the ways of common men, whose thoughts were not the thoughts either of his predecessors or contemporaries."

We have treated this reprint with some severity, because we feel that its publication has been quite unnecessary, and, still more, because we resent the attempt by a critic of some authority to foist upon us a book of exceedingly imitative and indifferent verses by means of grandiose language. It is a serious matter when a writer of Mr. Collins's position tries to persuade us by mere repetition of statement that one of the most awkward and tame and grating of postasters never lacks grace and vigour and uniformity of music. Words should mean something, and when they are thrown hither and thither in this way we begin to wonder whether all criticism is performed in this happy-go-lucky mechanical style. But we do not wish to be hard on Edward Herbert for sins against prosody committed nearly three hundred years ago. He showed his own opinion of his verses by never printing them, and there is no reason to suppose that he ever intended them to be printed. In closing we will quote a rather sprightly piece of fancy which is decidedly the very best quotation that we can make from his unlucky volume:—

Come hither, Woman-kind, and all their worth,  
Give me thy kisses as I call them forth;  
Give me thy billing kiss; that of the dove,  
A Kiss of Love;  
The Melting Kiss, a Kiss that doth consume  
To a perfume;  
The extract Kiss, of every sweet a part;  
A Kiss of Art;  
The Kiss which ever stirs some new delight,  
A Kiss of Might;  
The twacking, smacking Kiss, and when you cease,  
A Kiss of Peace;  
The Music Kiss, crotchet and quaver time;  
The Kiss of Rhyme;  
The Kiss of Eloquence which doth belong  
Unto the tongue;  
The Kiss of all the sciences in one,  
The Kiss alone.  
So! 'tis enough!

#### THE RELATIONS OF SCIENCE AND RELIGION.\*

AS often as the stream of progress in human knowledge gets an impulse so sudden and so startling as to involve somewhat of a revolution in the accepted notions of nature, nervous minds are vexed with the question in what manner or degree will the fresh discoveries tell upon the established order of religious belief. With every wave that rises to abnormal height and volume comes a shock which threatens nothing less than shipwreck to the ark of faith. Happily, after the first tremulous dip or staggering heave, the vessel has hitherto in every such crisis shown herself buoyant after the blow, and has settled herself steadily to her onward course. When three centuries ago the Copernican hypothesis took the world by storm, men seemed to hold their breath as at a struggle in which the old and new forces were engaged to the death. Bold and innovating spirits foretold the annihilation of what they deemed antiquated superstition. Zealous and orthodox adherents to the past met the newfangled and upstart ideas now with jealousy and dread, now with uncompromising and scornful defiance. We may fancy many a staunch upholder of orthodoxy among our forefathers having his fling at the impious absurdity with much the same happy use of Scripture texts as that of the Dominican Baccani in the cathedral of Florence—*Viri Galilai, quare statis aspicientes in celum?* The new cosmical theory was treated by Bacon with contempt, and by Milton, even after his colloquy with the martyr of science in his dungeon, with indifference at best. Yet, ere many generations had passed away, it stole into general belief, without any one feeling that the interests of religion had suffered thereby. Religion and science were again at one, and hardly a soul saving Tennyson's Northern Farmer has since in sane moments been known to whisper a word against the earth's turning round the sun.

Not quite so sharp nor so long sustained was the conflict set up within living memory, when the new claims of geology were popularly held to impugn the authority of revelation. Already it may be said that to all persons of liberal education the antiquity of the earth and of man, to an extent practically boundless as compared with the few thousand years laid down in the traditional systems of chronology, had become an established fact, and in all but the most elementary schools it is doubtless by this time being taught without the slightest misgiving that the proper authority of Scripture need be impaired thereby. All controversy upon these stages of scientific progress having been practically hushed, the question which at present engages a large class of earnest, if not timid, thinkers is that brought to the front by the recent emphatic advance in the philosophy of evolution, involving the problems of the unity and continuity of life, and the possibility of spontaneous generation or the origin of life from inorganic matter. Once more we hear proclaimed the incompatibility of the new views of nature with any degree or kind of theistic belief; on the one side by a hurried and active, if not numerous, band of students and professors of science, who, like Laplace, have no need of the hypothesis of a Creator and Ruler, on the other extreme side by a whole host of staunch and eager defenders of the time-hallowed order of things, to whom the teachings of Mr. Darwin and of Haeckel are at once groundless, wicked, and immoral. It is in this recently opened arena of thought that the intermittent conflict of science and religion is now being waged; and in determining the relations which the two forces must bear to each other as elements in the intellectual and spiritual training of the future lies a task as high and as critical as the mind can propose to itself. Is it possible that the harmony which has survived so many rifts and jars in time past is destined once more to make good its gentle and peaceful way over the whole realm of conscious intelligence? It is of the highest importance, at all events, to have the problem fairly and impartially stated on either hand; and there is great interest in seeing writers of undoubted qualifications sanguine as to the possible reconciliation of what to so many eyes appear hopelessly conflicting claims.

Two works of this class, moderate in size and marked both by ability and moderation in tone, have lately come before us, which agree in unreservedly adopting the facts and conclusions made good by those who are held the most advanced students of nature. In the first of these treatises, originally delivered as the Morse Lecture in connexion with the Union Theological Seminary at New York, Dr. Calderwood follows the plan of bringing under review the great fields of scientific inquiry that come within the scope of the evolutionist hypothesis, advancing from unorganized existence to man; allowing scientific observers to state results, as far as possible, in their own words, so as, without unnecessary detail, to present the most recent fruits of research in each separate field, the general result being to show that such modifications of thought concerning the origin, structure, and order of the universe as have been effected by the most advanced discoveries may be accepted by theologians as well as by independent thinkers. His view of the relations of science and religion may be broadly summed up in the words which he adopts from Mr. Herbert Spencer, that "he who contemplates

\* *The Relations of Science and Religion: the Morse Lecture, 1880, connected with the Union Theological Seminary, New York.* By Henry Calderwood, LL.D., Professor of Moral Philosophy, University of Edinburgh, &c. London: Macmillan & Co. 1881.

*Science and Religion.* By Alexander Winchell, LL.D. London: Strahan & Co. (Limited). 1881.

the universe from the religious point of view must learn to see that this which we call science is one constituent of the great whole, and, as such, ought to be regarded with a sentiment like that which the remainder excites; while he who contemplates the universe from the scientific point of view must learn to see that this which we call religion is similarly a constituent of the great whole, and, being such, must be treated as a subject of science, with no more prejudice than any other reality." Each party in consequence should strive to understand the other, with the conviction that the other has something worthy to understand, and with the conviction that when mutually recognized this something will form the basis of a complete reconciliation. Admirably, however, as Dr. Calderwood's argument breathes throughout the true spirit in which science and religion should approach each other, it is rather prophetic of the harmony to be hoped for from a candid and exhaustive recognition of the truth on either side than indicative of any immediate end to strife. It is delightful to think of professors of science and religion shaking hands as often as they meet, and going back each to work out separately his investigations of truth; but we must not confound the truce which our author glories in proclaiming with a permanent sinking of differences and harmonious co-operation of forces. Are the terms he lays down for this happy understanding such as would be accepted by the actual representatives of the broadly-divided schools which everybody knows to exist? And for what body of existing belief is it that Dr. Calderwood is empowered to speak? In the absence of any kind of definition we are unable to see that he stipulates for more than a vague theism, passing lightly over such fundamental points of controversy as that of the personality of the Divine Ruler, "who seeks righteousness above all things." Acquiescing fully in the teaching of science as to the fixity of laws, moral and spiritual as well as physical, subject, of course, to ever-varying conditions, he finds in science nothing to warrant the conclusion "that there can be no interposition from a higher sphere in order to secure application of physical law for attainment of moral ends." But it is precisely in picturing to the mind this higher sphere, and following it into action upon the sphere or spheres below it, that science has its difficulties. Out of such a tissue of negatives as our author strings together in the sentence we have quoted, it is hardly fair to call upon his reader to find the clue. The time has been when the weather, especially in its more striking phenomena of the hurricane and the lightning flash, was held to lie outside the pale of fixed physical order, forming a standing rebuke to the atheist and materialist—

*Cælo tonantem credidimus Jovem.*

The approximate surety of weather forecasts which science has now attained has brought this department well within the general order and uniformity of nature. Yet, under all the fixedness of atmospheric laws, there is infinite variety and uncertainty of weather, seasons, and climates; on which our author founds an argument for the action of a higher law, not nominally supernatural, for he studiously keeps clear of the word, but consisting in the subordination of the physical to the moral rule. In strict logic, however, his illustration leaves between the action of the two spheres a gulf as little to be spanned by thought as that which separates the action of the brain cells from the domain of consciousness. No less evasive of the direct issue is the way in which the question of miracles is disposed of. Against Hume's reasoning, "an example of misleading ingenuity," as he expresses it, he thinks it to the point to recall certain successful surgical operations at Edinburgh which the universal testimony of the profession had declared to be impossible. The bearing of such an illustration upon the credibility of the Scripture miracles of healing he considers obvious. There is no need, he infers, "for occupying time in trampling out the beaten straw by lingering over the argument that no evidence can be sufficient to establish a miracle, because a miracle is contrary to common experience." Our readers will not require us to point out that in the case brought forward there is no miracle at all, but simply a novel instance of what the laws of nature render possible. In short, the whole argument on the side of religion will, we fear, no more command the assent of the religious than that on the side of science will come up to the demands of the scientific reader.

In Dr. Winchell's work we find the fundamental question discussed with all that freshness and vigour which we have learnt to expect in writings which come to us across the Atlantic treating of the higher problems of thought. Starting from the point that the religious sentiments are co-ordinate with the knowing faculties, and demand from intellect the concession of a free field for exercise, he allows that the religious faculties are not directly cognitive, but must be served by the cognitive faculties, the grounds of religion, which is in itself spontaneous, being subject to a rational authentication. He is confident that nothing can eradicate religious belief from the soul; that the most advanced conclusions of science, such as the evolution or unbroken derivation of species, are to be received without disparagement of the fundamental doctrine of theism. The so-called conflict between science and religion is, he goes on to show, when not fictitious, "a conflict between science and religious or ecclesiastical systems, the real struggle resolving itself into a collision between the effete science which they embody and the results of more advanced science." His method of treatment is in consequence in a large measure historical, showing the phases which the religious belief of various nations and ages has gone through, as knowledge has made

its way, and increasing light has been gained in regard to nature, to man's past history and inherent powers, and to the general system of the universe. In a rapid sketch of the antagonising, or, rather, interacting, forces of faith and intellect he reduces the orbits described by these forces from the earliest times to four main cycles—the Egyptian, Chinese, Indian, and Grecian, with their subordinate movements, which make up their psychic history and prepare the way for what are now the ruling religions of the world. We feel surprised at the extremely cursory notice taken of the early Hebrews, pre-eminent amongst all races for religious instincts or ideas, although stress is laid upon the eclectic influence of Alexandrian-Jewish learning in contact with patristic theology in the Eastern Church. A brief but very able summary of ecclesiastical history and of the development of modern thought brings us down to the latest psychic cycle, which has been characterized as the divorce of thought from faith, its religious phase being Protestantism and its intellectual phase materialism.

The next psychic cycle, he is hopeful enough to think, will witness a synthesis of thought and faith, a recognition of the fact that it is impossible for reason to find solid ground that is not consecrated ground, that all philosophy and all science belong to religion, that all truth is a revelation of God. The divine agency, instead of standing removed from man by infinite intervals of time and space, is thus the true name of those energies which work their myriad phenomena in the natural world around us. Repudiating the term personality as "weakly anthropomorphic," though of use as the antithesis of monism and pantheism, he argues that the analysis of the idea and of the phenomena of causality lead the mind irresistibly to the conception of an agency uniting the three prime elements of intellect, sensibility, and will, of which it is impossible to think save as the attributes of a personal existence. In laying down, however, as unrestrictedly as Schopenhauer himself that will is "the only force in existence," he goes beyond the cautious language of Sir John Herschel that, "so far as we are admitted into any personal knowledge of the origin of force, we find it connected with volition, and, by inevitable consequence, with motive, with intellect, and with all those attributes of mind in which personality consists." On Dr. Winchell's showing, where would there be force before man's intelligence dawned upon the earth? He is more cogent, to our mind, in his treatment of derivation or evolution as itself a perpetual creation; unity and continuity of law and order being involved in the original cosmical plan, and being traceable by us until our thoughts are lost in the mystery of the impenetrable past. To arrive at the primary act, the moment of creation, or the energizing of the First Cause apart from all secondary agencies or conditions, would be for finite faculties to compass the infinite. What may be called our real conquests from the world within our ken—the primordial intuitions of causality, intelligence, ethicality, and goodness (the "agathological" argument, as he terms it, not clearly distinguishing it from the ethical)—blend with the reality of being which is forced upon us by the whole working of our inner consciousness in a rational argument for the existence of a Real Being, a First Cause, a Moral Governor, unconditioned and infinite in intelligence and goodness, and approachable by prayer. Yet, firm and broad as his argument may be thought, viewed as the foundation for a theistic system, in full and harmonious accord with the teachings of science, there is much to be done before the same reconciliation is made good between the new facts of physics or of history, and such special doctrines or traditional points of belief as are still largely held to be matters of revelation. We cannot think that our author's treatment of difficulties such as the Biblical cosmogony, or the Deluge, not to speak of the Fall and the Incarnation, providential government and the power of prophecy, will bring much satisfaction to Scriptural students, who may hardly think it enough to be told that "the Mosiac expressions are, like so many other passages of the Hebrew writings, to be taken in an Oriental sense."

#### MY LOVE.

*MY LOVE* is a readable and an amusing love story, although its "linked sweetness" is somewhat "long drawn out." The tone is decidedly more pleasing than in some of the author's best-known novels; there is nothing objectionably advanced in its politics, nor is there any offensive parade of antagonism to religion. It is a tale of love, pure and simple, although the three or more love affairs which run parallel to each other are illustrated or encumbered by a multiplicity of episodes; while a great variety of characters, vigorously sketched, are brought into active and energetic collaboration. Mrs. Lynn Linton generally inclines to the grave; but in this novel she is often humorous, and sometimes sprightly, or even comic. In her Mr. Branscombe she has worked out a humorous portrait of no little merit, although verging on caricature; while in Gip and Pip, the twin daughters of the comic Pennefather family, she almost descends into screaming farce. The novel takes its name from a lover's passing fancy. A certain well-born young gentleman, Mr. Cyril Ponsonby, is coming on a flying visit to the sequestered country neighbourhood where his betrothed resides, and in the exuberance of his blissful anticipations he inscribes on the window of the railway carriage the heart-felt ejaculation, "My love, my love." Mr. Ponsonby has every

\* *My Love*. By F. Lynn Linton, Author of "Patricia Kemball." London: Chatto & Windus. 28s.

reason to believe the charming Stella Branscombe to be absolutely his own. He has been accepted as her future husband, with the assent of her parents; and when his impatience leads him to turn up at the breakfast table, although expected much later in the day, Mrs. Branscombe is nearly as happy to welcome him as her daughter, while Mr. Branscombe appears to be as friendly as any son-in-law on his promotion could desire. Had these fair appearances not been deceptive, the novel need never have been written. But, even before the family had risen from breakfast, we see signs of the little rift in the lute which is to mar the pleasant domestic concert and lead to a long probation of misery, with the chance of things coming right in the end. Branscombe *père* must be one of the most difficult of mortals for a quick-witted or straightforward young fellow to get on with. He is the very incarnation of selfishness and feather-headed vanity; he believes in the possession of a genius of an eminently transcendental order; and, what is worse, he has, to all appearance, made his loving wife and daughters converts to his intolerable creed. He writes poems which are never published, except occasionally "for private circulation"; and he paints pictures, which he would gladly impose on the public, if the public taste could be elevated into appreciating them. But he writes and paints over the heads of the world, being content to expect his immortality in more æsthetic generations. Meanwhile his only worshippers are his wife and the sweet and affectionate daughter Stella, who dutifully follows her mother's lead. Such being the circumstances, we are somewhat puzzled to know why Cyril Ponsonby should have been accepted as a suitor for the hand of Mr. Branscombe's heiress; nor is the mystery satisfactorily cleared up. For Cyril has but small means; he looks for his future to an Indian civil appointment; and, though a pleasant young fellow, in the eyes of the transcendental father he must always have been an unmitigated Philistine. We can better understand his having won favour with Mrs. Branscombe, and that lady is most anxious to urge the marriage forward. The fact is that she knows what other people only suspect, and is assured by the sad experience of her wedded life that her æsthetic husband is a thoroughpaced humbug. If he imposed upon her fond fancy when a girl, he speedily showed himself in his true colours. She knows that, with all his affectation of culture and talent, he is really a very commonplace person. Yet, having pledged herself to love, honour, and obey, she has over-scrupulously fulfilled those wedding vows, and become the most amiable and spaniel-like of hypocrites. How she has continued consistently to profess the faith she had long ago been disabused of; how she has persistently laid her common-sense and her happiness at the feet of the most exacting of domestic tyrants—is very cleverly and touchingly told. The result is that she has been worn down towards the grave by inches; and that she is become assured that she must soon be carried off by heart complaint. In the ever-present consciousness that her days are numbered she is anxious that her daughter should not be sacrificed like herself. Of course the marriage she strives to forward does not come off in time, and Mrs. Branscombe dies suddenly, just as she had expected. Then Stella's position becomes extremely embarrassing and painful. Very naturally, but most unluckily nevertheless, Mrs. Branscombe had never undeceived her daughter. The orphaned Stella never doubts that she must be all in all to her widowed father. That respectable humbug bears himself under his bereavement precisely as his most intelligent neighbours had expected. He soothes his unspeakable grief by writing an elegy and designing a monument that shall commemorate his anguish at the loss of the departed; and he quietly makes up his mind that he must keep his daughter to succeed her mother as his amanuensis and admirer-in-ordinary. The devoted Stella would be nothing loth, could she reconcile her filial affection with her duty to Cyril. And as Cyril must start for India very soon, Mr. Branscombe decides to give him his dismissal. Moreover, the antagonism that must always have existed between the men grows stronger day by day. But Branscombe is too cunning and too polished to go brutally about his selfish work. He turns the screw upon his devoted child with honied phrases, and makes insidious advances towards the end he has in view. At last, when Cyril's departure draws nigh, Stella is driven to make her choice; and, though her heart is torn at the thought of the separation, filial duty triumphs over her love. It is only natural that Cyril should resent having the cup of happiness dashed from his fingers. "He, on his side, offers her a choice in turn. On her sticking tearfully to her pious resolution, he gives her up, and starts for India, insinuating at the same time that he will probably go through India to the mischief, and casting the responsibility for his future misdeeds on the girl who has thrown him over. It must be owned that the young lady's situation is as little enviable as well can be. And after a short time it changes decidedly for the worse. After being her father's obsequious literary and domestic slave, she sees herself ousted from that once-envied position by a bosom friend who has proved false and treacherous. Hortensia Lyon has had the advantage of approaching Mr. Branscombe with the genuine adoration which is the sincerest flattery; and when the elderly Adonis makes her an offer of his hand, the young girl feels only too honoured by accepting it. But, if Hortensia is all milk and honey to her plastic husband, she shows herself the most despotic of stepmothers; and Stella has hourly reason to regret the choice which she made from the most virtuous motives. It is very happy for her that the accounts she has received of Cyril Ponsonby's reprehensible conduct turn out to have been either calumnious or exaggerated; and that his early passion, far from having cooled, has only grown hotter in his warm place of exile.

Had we been shut up with Stella in her melancholy home, the novel, though it might have been pathetic, must have been gloomy enough. But there are very lively personages in the neighbourhood, of whom Stella sees something from time to time, and with whom the reader is invited to associate more freely. Perhaps the pleasantest and cleverest of these is Augusta Latrobe, who, like Stella, goes through a succession of trials as a prelude to a happy marriage. Mrs. Latrobe is a middle-aged widow, who had married an elderly *savant* against her mother's wish, and who is now, with one little boy, left dependent on her mother for subsistence. And her mother makes herself even more disagreeable than Mr. Branscombe, while she is decidedly more malicious. She never ceases to reproach her daughter with the undutiful and unfortunate connexion she had formed, as with the poverty which has been the appropriate penalty of her sin; and she misses no opportunity of taking up her testimony against the indecency and immorality of second marriages. She expresses herself perhaps more strongly on that subject than she feels, because Mrs. Latrobe might escape from the maternal clutches at any moment, by listening to one of two rival suitors. But, though Augusta Latrobe suffers and weeps a good deal, and almost breaks down occasionally under the burden, she is carried along, on the whole, by her sensible and sunny nature. One weak thing she has done, in a moment of collapse and depression, and it seems to us strangely inconsistent in her. At her spiteful old mother's dictation she not only has given the most disinterested of her admirers his dismissal, but given it in language that was cruelly and gratuitously harsh; and, if that inexcusable note does her no harm ultimately, we must say it was more good fortune than she deserved. Mrs. Latrobe's quiet common sense and readiness of speech make her often extremely amusing; but there is more broad fun to be found with the rattling Pennefather family, although the fun is so highly flavoured that a little of it goes a long way. The Pennefather twins, Gip and Pip, are clever examples of good-natured and warm-hearted girls, spoiled by the detestable modern fashions of fastness and slang. They are pretty, and by no means stupid; yet, meeting them merely in print, we are always mistaking them for their brothers; and we inevitably ignore the personal attractions that may have made men flirt or fall in love with them. So it comes almost as a shock to us when one of them engages herself to a youth fresh from college, who rather prides himself on his refinement. The explanation is that he has been fascinated by Stella Branscombe; and when he finds that that deserted Ariadne will have nothing to say to him, he turns for consolation where he is certain to find it, and proposes for one of the Misses Pennefather in the abandonment of hearty good-fellowship. It is natural enough that any girl, whatever her manners, should wish to marry; but we are reminded that these masculine Misses Pennefather have tender and feminine hearts when the one twin announces the engagement to the other. The happy bride elect had forgotten her sister's feelings for the moment; but she is painfully reminded of them by the other's grief at the announcement of the severing of the tie which has united them. Altogether Mrs. Lynn Linton has written an agreeable story; and it is agreeable chiefly because, with the single exception of Mr. Branscombe, she has always taken some pains to show the more amiable side of her least amiable characters. Even the malignant mother of Mrs. Latrobe comes out to decided advantage on her death-bed.

#### MINOR NOTICES.

THE value of Mr. Holmes-Forbes's æsthetic doctrines (1) may be estimated by the fact that, in his opinion, "every piece of sculpture and every piece of painting should contain a moral or a lesson in life or conduct." He is equally rigid in his conception of the aim of poetry. "It must now be shown," he says, "that the beauty of poetry, like every other sort of beauty, attaches only to utility, and that the utility of poetry is akin to that of statuary and painting, and consists in the inculcation of a moral." As if this were not plain enough, he adds:—"The purpose of a poem, whatever its subject, must be the inculcation of a moral. If this condition be ignored, though the piece be in verse, though it be in rhyme, though it be witty and ingenious, it will not be in good taste or it will not be poetic; for what is poetic is admirable, and so-called poetry which is without a moral is not in good taste, is not admirable." The relation of morality to art was probably never more crudely misrepresented in a book professing to be a serious contribution to science. Regarding what he calls "the objective element of beauty," Mr. Holmes-Forbes has no more novel theory to offer than that it consists of "the quality of suggestiveness." The beauty of a sunset, for instance, arises, he thinks, from its suggesting, among many other things, "great volumes of wool," "lace curtains," "fluffy feathers from angels' wings," "waves of milk," "a conflagration," and "a volcanic eruption." It may be true that the problems connected with the origin and nature of the æsthetic emotions can be solved only by the methods of psychology; but these problems are by no means so simple as Mr. Holmes-Forbes supposes. Even if they were satisfactorily disposed of, æsthetic philosophy would still have to determine the laws by which one species of art is distinguished from another, and to show how far the manifestation of the senti-

(1) *The Science of Beauty: an Analytical Inquiry into the Laws of Æsthetics.* By AVARY W. HOLMES-FORBES, M.A. London: Trübner & Co. 1881.

ment of beauty has been modified by the different conditions of various races and periods. It does not seem to have occurred to Mr. Holmes-Forbes that these things come within the scope of "an analytical inquiry into the laws of æsthetics."

The editor of the prettily got-up *Wit and Wisdom of Lord Beaconsfield* (2) has brought his volume out at the timely moment when active-minded English men and women, bent on their well-earned holidays, are meditating how to compromise between the mental coma which their inclination leads them to covet and the summer reading which their pride and vanity delude them into planning. We cannot conceive a better pocket-companion for the tramp over Snowdon, Leith Hill, or the Rigi than this collection of short extracts. The book is the more readable because most happily unarranged. Many of the passages have been reduced to that condition of pure epigram in which, as we have no doubt, they were originally minted in their author's brain before they were put into the mouths of characters who are apt even beyond the wont of the creations of most novelists to speak the tongue of their inventor. That which is, in fact, a defect in the novels themselves makes them peculiarly available for the purveyor of *Elegant Extracts*. The editor also includes chosen passages from Lord Beaconsfield's Parliamentary speeches, so as to indicate the whole range of his intellectual campaign.

The interest of *Clifford Gray* (3) is to be found in the curious parallel between the disreputable young person of Mr. Mallock's vision in his lately published volumes and the disreputable young person of Mr. Hardinge's lachrymose imagination. In the minor picture galleries one often comes across as many as half a dozen studies of the same subject—"A Haunted House," "Afternoon," or what not. It soon becomes manifest that the subject has been set for the members of some drawing or painting Society, and they have each sent in their own rendering of the topic. After reading Mr. Hardinge's rueful little romance, one is inclined to suspect that he and Mr. Mallock belong to the same Writing Society, and have therefore attempted the same subject. "Describe the loves of a beautiful young man, religious or æsthetic, and of a beautiful and chaste-looking *dame galante*." This appears to have been the topic. And the worst of it is that, if there are a dozen members of the Society, we may have ten more novels about the inner consciousness of a lady not a whit more meritorious than the old Skittles of old railway literature. Mr. Hardinge has not treated the subject in the same manner as Mr. Mallock, whose hero was a sufficiently robust Conservative in politics, and, as it appeared when he tackled the Colonel, a man of his hands. Mr. Hardinge's hero is, in very truth, a "greenery gallery Grosvenor Gallery, foot-in-the-grave young man." He is passionate and hectic. He rejoices in the sweet name of Clifford Gray; and, when we first make his acquaintance, he is dying of a decline in the romantic neighbourhood of Upper Norwood. He presents himself "without seeming to have refreshed himself by the *négligé* costume he had put on," which shows how really ill he was. Even in the Crystal Palace he is not happy; the very plaster cast in which he had once recognized the congenial features of Antinous does not exhilarate him, and he quivers painfully when he meets a young lady who diffuses a scent of sandal-wood. Clifford Gray is an artist, and the hero of a *poirinaire* romance. In the youth of that sort of fiction, the naughty heroine was always consumptive, while the hero was in perfect health. Mr. Hardinge has made a change. It is the hero who coughs, while perfect health is the possession of the heroine. The lady is named Véra Trekkoff, and we learn all about their passion from the pages of a lackadaisical diary kept by the hero. He met Véra at a *table-d'hôte* in Lucerne. She was as pretty as a picture of Leonardo's, and she was like a Diana surprised when Clifford caught her in the act of reading the *Journal pour rire*. This beautiful being (and really the descriptions of her beauty leave nothing to be desired) was travelling with a dying uncle, Count Trekkoff. "He will die," she said, "and I cannot be sorry. Is not that extraordinary? Daily, hourly, as he gets weaker and weaker, I feel my own life expand; look at me." She was not really, as her words implied, "swelling visibly before his very eyes," but her language was certainly unconventional. The reader, in fact, begins to suspect what Mr. Gray finds at last to be true, that Véra's "uncle" really stands to her in a different and more close relation. As Gray falls in love with her and grows thin, the Count grows fat and jolly. Véra confides to her admirer that she once poured boiling sugar over a live chameleon, which she has had set in diamonds, and wears in her hair. As the lizard is getting shabby, she asks him for a new one. But these indications of her character do not destroy his affection. If we understand Mr. Hardinge, Clifford Gray means to reclaim Véra by the gift of his own natural goodness of soul. His Véra sings what Mr. Hardinge will regret to find that the printers call "a rather *risqué* song" and he does not like rather *risqué* songs. Finally the pair are betrothed, and come to Paris. Véra makes her lover leave her house by the servants' staircase while she admits another man. Next day the wretched Clifford Gray hears her voice in the bedroom next to his at his hotel, where Véra is getting back her letters from a former lover. After this discovery Gray breaks a

bloodvessel, and spoils Véra's best dress. "I felt her breast beneath my lips, and all her white and rose and silver was stained to scarlet with blood, as I tumbled forward, like a senseless, life-drained thing, into the arms at last of a woman that was a sinner." The hero seems to have been inclined to forgive Véra and to resume his relations with her. But from this degradation, at least, he was rescued by events. An early grave and a brilliant marriage wind up this instructive story.

Miss Jay's *nouvelle* (4), which has some strong and stirring qualities, seems to show that in some parts at least of Ireland the people are now just as much their own enemies in the face of all attempts at improving their condition as they were in the days when Miss Edgeworth wrote her fascinating story *Ennui*. Miss Jay's story is, however, of a far darker cast than the one just referred to. As to the prevalence of the state of mind, or no mind, and its terrible results, which she depicts with an incisive pen, there can, unhappily, be no doubt, and the author writes with an air of knowledge and experience which makes it difficult to cast doubt upon her explanation of things which are suggestive enough in cut-and-dried newspaper reports, but of which her treatment may impress some people whose attention would otherwise be unmoved. It is not to be thought that Miss Jay would have us believe that all Irish Roman Catholic priests resemble the infamous, yet genial and popular, Father Malloy of her story; but there is too much reason to suppose that he is not inaccurately drawn from a type which is not exceptional. The grim and tragic tone of the little book is artfully relieved wherever it is possible; and we can say for ourselves that we have read its three hundred pages with un-failing interest.

A third edition, in one volume, has appeared of Mr. Beresford Hope's novel *Strictly Tied Up* (5). Of the book itself it is needless to say anything now, inasmuch as it was reviewed at length in these columns at a time when its authorship was unknown alike to reviewers and to readers. The present edition, however, derives a new interest from the words of preface which now herald the novel. These begin by explaining the black border which surrounds the touching dedication to "The Dear Light and Guide of the Author's Life." Lady Mildred Beresford Hope, it appears, knew nothing until its actual appearance of the book which "I contrived to write, publish, and dedicate quite unknown to her, and anonymously, and then to place in her hands with the full confession of my plot of love. I joyed to think that I was thus discharging a little of life's debt; for, beyond my serious ethical aim, my chief object was to surprise and please a wife who had, for more than thirty-eight years, endured so much and laboured so much for her husband." These words are followed by a tribute to the memory of Lady Mildred Beresford Hope, which is thus closed:—"Lady Mildred Beresford Hope's inner character was, of course, unsuspected by strangers, and still more closed to them was that innermost life of the soul, of which, although I shall leave my picture incomplete, I refuse to speak. They could only see the bright participator of a socially prosperous career, or catch the cheery laugh and witty speech of the woman then most courageous when fighting against weary pains and weaknesses, constantly recurring, of which the secret was her own." These words leave something, as it should be left, to be understood, and thus illustrate the great maxim "There is so much *not* to say." Respect for the same principle prevents us from enlarging here on the career referred to.

A somewhat strange little book called *Post Mortem* (6) possesses a good deal of imagination and force. It purports to be an account of what was seen and endured by a soul in purgatory, and in the conception of the purgatorial state—which is represented, to put it baldly and briefly, as a kind of prolonged nightmare—we find originality and invention. The narrator is a country squire who died in 1759, and for the first two-thirds of the book the fact of his having died before, to take an instance, the Reign of Terror, is turned to excellent account. The last part of the book is the least satisfactory. The author would have done well to be content with making his readers follow him through the weirdly fascinating adventures of Henry Coke in Chaos, and to avoid consigning the whole population of the nineteenth century to the bottomless pit. As we have said, however, the earlier part of the book will be found to contain both performance and promise.

*Friends* (7) is an unpretending little story, which is prettily conceived and executed, but which is, to our thinking, wanting in the power of character-drawing. That Nordhall is somewhat dull and somewhat priggish, though he is meant to be quite the reverse, is less surprising than that Mrs. Strong (his partner in the "dust") should be so unlikely a personage as she is, or, we should rather say, as she turns out to be at the very end of the book. We closed the volume with a suspicion that the author had intended to give the story a different and more probable ending, but had been persuaded at the last moment to truckle to the demands of sentimentalism.

(2) *Wit and Wisdom of Benjamin Disraeli, Earl of Beaconsfield*. Collected from his Writings and Speeches. London: Longmans & Co. 1881.

(3) *Clifford Gray*. By W. M. Hardinge. London: Smith, Elder, & Co.

(4) *The Priest's Blessing; or, Poor Patrick's Progress from This World to Better*. By Harriett Jay, Author of the "Queen of Connaught," &c. London: White & Co.

(5) *Strictly Tied Up*. A Novel. By the Right Hon. A. J. B. Beresford Hope, M.P. Third Edition. 1 vol. London: Hurst & Blackett.

(6) *Post Mortem*. London and Edinburgh: Blackwood & Sons.

(7) *Friends: a Dust*. By Elizabeth Stuart Phelps, Author of "The Gates Ajar," &c. London: Sampson Low & Co.

*Baby Rue* (8), which belongs to the same series as the volume just noticed, is a stirring and graphically-told story of Indian warfare, in the course of which full justice is done to the "redskins" by the author, who seems to have a just appreciation of their character, and of their wrongs at the hand of the white man. The book is perhaps a trifle dull in the earlier chapters, but as soon as the author gets well into the story the interest rises continually until the climax is reached.

Dr. Flower's entertaining and instructive little volume (9) ought to be read and remembered by the natural guardians of all women or girls who have a fancy for the "hideous beauty" of small waists and Chinese feet.

The first part of Mr. Piggott's work (10), dealing with the effect of a foreign judgment in the English Courts, was published two years ago, and is now complemented by the present volume, in which the author has "collected, as far as it has been possible to obtain it, the foreign and colonial law bearing upon foreign judgments and upon service out of the jurisdiction."

A second edition, carefully brought down to date, has been published of Mr. Harris's *Principles of the Criminal Law* (11). The work is brought out in its revised form under the care of the original author and of Mr. F. P. Tomlinson.

A second edition also appears of Mr. Justice Fry's well-known work on *Contracts* (12).

We have also to note the appearance of a third edition of Mr. Pollock's *Principles of Contract* (13). The volume is heralded by an "introduction," which, unlike too many introductions, is well worth reading.

Mr. Herring's (14) thirty prescriptions are capitally chosen, and his remarks upon them are for the most part sensible, and to the point. It is a little odd to find a mixture of spirit of lavender, ammonia, and camphor described as "a simple tonic"; but, as Frederick says in *The Mimic*, "I can call my hat a Cadwallader, if I choose."

(8) *Baby Rue*. By Charles M. Clay. London: Sampson Low & Co.

**ISLE of WIGHT PROPRIETARY COLLEGE, APLEY**

(near HYDE).

The WINTER TERM will commence on Friday, September 16.

Full particulars from the Rev. Canon TEESDALE, Head-Master; or the SECRETARY, The Cottage, Millville Street, Ryde.

**ST. EDMUND'S COLLEGE, SALISBURY.**—A HIGH-

CLASS SCHOOL for SONS of GENTLEMEN. The religious training is upon definite Church principles. Boys are Educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, £75 a year.—For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOURNE, D.C.L.

**A BINGDON SCHOOL.**—This Foundation (A.D. 1563), Six

Miles from Oxford, has complete new buildings in large grounds. Classical and Modern Departments, with strong staff of Masters, valuable University Scholarships. Thorough preparation for the Military and other Professional Examinations, and careful grounding for Boys whose destination is the larger Public Schools. Well-ventilated Private Studies and Infirmary, Five-courts, rowing for Boys who swim.

School Fees, £27 to £35; advantages to the Sons of the Clergy.

Apply to the Rev. E. SUMMERS, B.D., Head-Master.

**TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.**—

The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially for Modern Languages. Special preparation for the Universities, Army, and all competitive Examinations. Exhibition to the Universities of £50 per annum. Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Terms 50 and 60 Guineas.—Apply to the WARDEN.

**SOUTH KENSINGTON PREPARATORY SCHOOL,**

25 Hereford Square, Gloucester Road, S.W.—The SONS of NOBLEMEN and GENTLEMEN are thoroughly prepared for Eton and other Public Schools. Careful individual attention. Special care of young Boys just leaving home. Experienced Governors for young Pupils. Head-Master—A. B. B. SCOTT.

**HIGHGATE SCHOOL.**—The Next Term commences Tuesday,

September 20. In the Indian Civil Service Examination of this year a Pupil passed first from the School 17th out of 31 successful Candidates, and was first for Greek and first for Latin of all the Candidates.—For particulars of admission, apply to the Rev. C. McDOWALL, School House, Highgate, N.

**FINDEN PARSONAGE, WORTHING, Sussex.**—The Rev.

W. D. ALLEN, M.A., Vicar of Finden; Fellow and, from 1872-1881, Tutor of Magdalen College, Oxford; old Rugbyman, has vacancies for HOUSE PUPILS, to be prepared for the Universities, &c.

**FOLKESTONE.**—Mr. W. J. JEAFFRESON, M.A. Oxon.,

assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. A few Vacancies.

**THORNDENE, OAKLEIGH PARK, Station on G. N. R.**

Miss MATHER has vacancies for DAUGHTERS of GENTLEMEN. Large detached house. Large garden. Healthy situation. London Professors. Pupils taken into house at University Local Exams. Christmas Term will open September 20th.

**ASHFORD SCHOOL, KENT.**—*Head-Master, E. C. MUSSON, M.A., F.G.S.,* formerly Scholar and Friceman of Queen's College, Cambridge, sometime a Master in Christ Church College. Very healthy and pleasant. New buildings contain separate cubicles and a detached Infirmary. Terms low and strictly inclusive. Special preparation for Woolwich, Sandhurst, Legal and Medical Preliminary, &c.

**PREPARATORY SCHOOL, Langley Place, LANGLEY, BUCKS.**

Mr. W. E. W. COLLINS, late Scholar of Jesus College, Oxford, and for some time Composition Master at Richmond School, Yorkshire, and Mr. LEONARD B. KEYSER, for four years Assistant-Master at the Rev. J. W. Hawtrey's, Aldin House, Slough, receive BOYS between the ages of Eight and Fourteen, to prepare for entrance on the Classical or Modern side of the Public Schools, or for the Royal Navy.

BOYS are also especially prepared for Junior Scholarships at any of the Public Schools.

Langley Place is a few minutes' walk from Langley Station, on the G. W. R.; is four miles from Windsor and two and a half miles from Slough. It stands on gravel soil, above the level of the Thames. The sanitary arrangements are excellent.

References and full particulars will be given on application at the above address.

**MILITARY and CIVIL SERVICE EXAMINATIONS.**—

There is a Department in connexion with HAIR LODGE SCHOOL, POLMONT STATION, Birmingham, for preparation for Government Examinations. Honours gained during the past year. Three Appointments to Woolwich Academy. Seventh Place for Indian Civil Service, &c. &c.—Full particulars on application to the HEAD-MASTER.

**NAVAL CADETSHIPS, PUBLIC SCHOOLS, and ARMY.**

At LITTLEHAMPTON, the healthiest place on the English Coast. Mr. T. EASTMAN, M.A., Cambridge Math. Honours (eldest Son of late Mr. Eastman, R.N. Commander of the Naval School, Southsea), and Mr. A. M. STEWART, M.A., Oxon. Double Classical Honours. Long experience and unfailing success. Good house and playground, with every comfort.—Present address, Brook House, Godalming.

**PREPARATORY SCHOOL, AMESBURY HOUSE, Pargo Heath, BICKLEY, Kent.**—Rev. EDMUND FOWLE receives THIRTY-THREE BOYS under the age of fifteen, to prepare for the Public Schools.

The house, surrounded by six acres of land, is situated in a charming locality, thirteen miles from London.

There is every requirement for a high-class Private School, a cricket and football ground, large iron playground, forming gymnasium, &c., two Eton five-courts, workshop, dry playground, and a run of a third of a mile on a dry gravel path.

The soil is gravel, and all the Sanitary arrangements in and out of the house have been under the special supervision of Dr. ALFRED CARPENTIER, of Craydon.

Every Educational advantage given and many comforts offered, the greatest care being taken of little Boys on their first leaving home.

Great success has been met with, several open Scholarships gained, and in no single case has a Boy failed to take his proper place at a public school.

Rev. EDMUND FOWLE is well known by his very successful series of Latin and School Books, and for his Eton Greek Reader—written by special request for that School, and now in use at Eton, Harrow, Merchant Taylors', &c. Terms, from 80 to 120 guineas.

Address, till further notice, Ballyards, Armagh.

**OVERSLADE PREPARATORY SCHOOL (near RUGBY).**

The Rev. G. F. WRIGHT, M.A., late Fellow of C. C. C. Camb., formerly Assistant-Master at Shrewsbury School and Wellington College, prepares BOYS from eight years of age for the Classical or Modern Sides of Public Schools.

**LAKE DISTRICT.**—The Rev. T. STEVENS (Wrangler) will have a Vacancy for a PUPIL in September. Climate suitable for delicate boys. Mountain and sea air; bathing, boating, fishing.—Address, Eden Mount, Grange over Sands.

**THOROUGH PRIVATE TUITION** is offered, in a large Country House, to a few GENTLEMEN'S SONS (over Fifteen) who require extra care. For references and terms, address M.A. Oxon, Mill Bank House, near Malvern.

**C. H. ROSE, M.A.,** of Conyngham House, RANSGATE (formerly Eleven years at Chesham School), will be joined in preparing PUPILS for the Public Schools by the Rev. H. C. V. SNOWDEN, B.A. (fourteen years Hon. Assist. Master to Rev. W. F. Baring, Thorpeauville), House large, with perfect sanitary arrangements, and grounds of nearly four acres. Prospectus on application.

**EDUCATIONAL HOME for the DAUGHTERS of GENTLEMEN.**—THE GRANGE, Emdenleh, BONN-ON-THE-RHINE, Germany.—Number of Pupils limited to Twelve. Manned English home. Resident North German and Parisian Governesses. High-class Masters for accomplishments. Unexceptionable references.—Apply as above, to the Directress, Mrs. BERNHARD.

**HEAD-MASTER for the GROCERS' COMPANY'S MIDDLE**

**CLASS SCHOOL, HACKNEY DOWNS.**—Notice is hereby given that the Court of the Grocers' Company will, in November next, proceed to the appointment of a HEAD-MASTER of their Middle Class Day School at Hackney Downs, built to accommodate from 200 to 300 Boys (the present number of Boys in the School is 235). Fixed salary, £100 per annum. Capital fee, £1 per Boy up to £400, and 10s. per Boy beyond that number.

The new Head-Master will enter upon his duties at Christmas next. He will be appointed subject to the provisions of a Scheme of the Endowed Schools Commissioners. He need not be in Holy Orders, but must not accept or hold any benefice having the cure of souls, or any office or employment, which, in the opinion of the Court, may interfere with the proper performance of his duties as Head-Master.

Further particulars may be obtained upon application to the CLERK of the Grocers' Company, Grocers' Hall, Foultry, London, E.C.

**COLLEGE and GRAMMAR SCHOOL, AUCKLAND, NEW ZEALAND.**—A HEAD-MASTER is REQUIRED for this Institution. He must have graduated in Honours at one of the leading Universities in the United Kingdom, and had experience and success as a Master in some important Public School. The salary will be £700 per annum, without house allowance, but with a Capitation Fee of 10s. for every Pupil paying school fees. £150 will be allowed for passage money to the Colony.

The following gentlemen have consented to act as a Commission for the selection of the Master: Professor Blackie, of Edinburgh; Professor Dowd, of Oxford; Arthur Holwick, Esq., of Oxford; and the Rev. J. M. Wilson, Clifton College. Intending candidates can obtain of the undersigned application forms and printed statement giving further particulars as to the School, and conditions of the appointment, &c. All applications must be made on the forms, and be sent in, or before September 30, to WALTER KENNAWAY, New Zealand Government Office, 7 Westminster Chambers, London, N.W.

**GOVERNESS.—RE-ENGAGEMENT REQUIRED** by an experienced Teacher in a Gentleman's Family. Good English, Arithmetic, Drawing, French, Latin, and Music. Able to prepare Boys for the Public Schools.—Address, Y. G., Plas Llywyd Cottage, Aberystwyth, Denbighshire.

**A RESPECTABLE COUPLE,** giving up housekeeping, would be glad to meet with SITUATION as COOKS, town or country. A gentleman or gentleman with fishing or shooting box would find them capable of doing all required; have been in good families.—Address, J. M., 7 Bayham Street, Camden Town.

## BLINDNESS.

At least one-fourth of those suffering from Blindness can clearly trace their calamity to the use of Spectacles imperfectly adapted to their sight by ignorant pretenders to Optical Science. Mr. HENRY LAURANCE, F.R.S., Oculist and Dispensing Optician, 3, Endsleigh Gardens, London, can, by reason of his long and successful experience, supply daily (Saturdays and Sundays excepted) from Ten to Four, Mr. Laurance's engagements at various institutions prevent him from being personally consulted at any other time. Sir JAMES MANROD, Manchester Square, London, writes: "I have tried the principal opticians in London without success, but your spectacles suit me admirably for reading and walking. The clearness of your glasses as compared with others is really surprising." Dr. HIRD, Chelmsford, late Surgeon-Major West Essex, writes: "I could not have believed it possible that my sight could have been so much improved and relieved at my age, Eighty-two. I can now read the smallest print, although suffering from cataract on the right eye." Mr. Laurance's practice is now entirely by post, containing two hundred Testimonials similar to above, including Dr. C. E. Radcliffe, St. Cerevald Square, W.; Consulting Physician to the Westminster Hospital; the Ven. Archdeacon Palmer, 17 Victoria Square, Clifton; Bristol; John Deane, Esq., F.R.S., Mayor of Cambridge; John Lane, Esq., M.P., F. Lynn, Physician to H.R.H. the Duke of Wales; Lordes; and the Duke of Devonshire; Baron Douglas, Calcutta; Major Fyfe, The Avenue, Brixton Hill, &c. &c. Established Twenty-seven years. Consultation free.

## MR. GLADSTONE'S COMPROMISE.

AT last the Irish Land Bill has passed through all its trials—except the trial of being set practically to work. The excitement which was caused at the end of last week by the apparent probability of a collision between the two Houses was to a great extent factitious. For days—indeed, for weeks—certain Radical organs had been pointing out to their readers how intolerable it was that the Lords should have a chance of spoiling the measure, and it was almost a matter of course that they should endeavour to show that their fears were realized. On the other, the defiant mood in which Mr. GLADSTONE huddled the Lords' amendments at their first return naturally created the impression that there was mischief in the air, and provoked the Lords to "insist" somewhat more peremptorily than they might otherwise have done. Yet the reference backwards and forwards of an important measure from one House to the other is no such unheard-of occurrence; and the spirit of the debate on the second reading in the Upper House was an almost certain pledge that no underhand endeavour would be made on that side to throw the Bill out by means of insisting on unreasonable amendments. The second consideration of the Lords' proposals was conducted in a much more moderate and becoming temper than the first, and some important concessions were made. As might have been expected, the Lords met these concessions in a proper spirit, and the hitch magnified by quidnuncs into a crisis was past. The eager haste of the Hundreds to get up indignation meetings has rather ludicrously overrun itself. Yet even these few hours of agitation had a somewhat beneficial effect, as showing the utter falsity of the contention that English opinion is in favour of the Land Bill. That opinion is perhaps in favour of continuing Mr. GLADSTONE in power, and, things being so, declines to pronounce itself against a measure to which he has pledged himself; but even under the powerful stimulus of a possible collision between Lords and Commons, not the slightest enthusiasm for the measure itself has been manifested except in extreme Radical cliques. It is tolerated and acquiesced in, and that is all—except that an intense weariness of it disposes every one to wish it over and done with. Had the Lords actually delayed its passing it would have been this wish and not any belief in its efficacy or intrinsic merit that might have disposed Englishmen to look unfavourably on their action. But it has not been wrecked, and has hardly been even hindered beyond a reasonable time. Ingenious Radicals protest, of course, that if it fails it will be solely in consequence of the concessions made to the Lords. They may be left face to face with the admission of Lord CARLINGFORD, an admitted partisan of the tenants, and the Government care-taker of the Bill in the Upper House, that the alterations of the past ten days have, in his opinion, distinctly improved it.

An equally natural, though curiously inconsistent, line has been taken by other Government partisans who declare that no concession worth speaking of has been made at all. This party may be congratulated on the possession of at least a great deal of courage. The insertion of the proviso that payments made by one tenant to another are, in no case, to constitute in themselves a claim to reduction of rent, removes the greatest wrong of the whole measure—a

wrong which has been unceasingly protested against from the very first introduction of the Bill, and which has been steadily ignored by the Government. It is true that they repeatedly denied that any such wrong was intended; but they steadily refused to render it impossible that, in virtue of successive exorbitant payments for tenant-right, the landlord's rent should be whittled down to nothing. This has now been made impossible, and it is the doing of the Lords. In the same way the Government have again and again turned a deaf ear to the repeated demonstrations of the injustice and impolicy of forcing the landlord to raise the rent before he can go into Court. But now their ears have been opened, and Mr. GLADSTONE himself avows the hardship, the existence of which he has for months refused to acknowledge. The excision of Mr. PARNELL's amendment deprives dishonest tenants of a shelter which they would most certainly have sought. Even the wild duck clause, over which some persons have made merry, while others have inveighed against it as an extension of the hated feudal rights of sporting, is a substantial and purely business-like confirmation of rights of property. In miniature, indeed, the references made to this insignificant amendment by the fervid partisans of the Bill are a very good picture of the knowledge of Ireland which they so frequently display. Ireland, they may like to hear, is in many parts a swampy and moorland country surrounded by the sea; and in such a country the possession of the wild fowl frequenting it by A or B respectively may make, over no very large estate, a difference of hundreds a year. When these concessions, small and large, are added to those made at the first reference to the Commons, the total amount will be found very considerable. The leaders of the Opposition and of the Government were perfectly justified in saying that the spirit of the Bill has not been affected in the least by these concessions. They have simply explained provisions which might have inflicted, and would certainly have inflicted, intolerable wrong, or else have removed excrencences calculated to make the difficult lot of an Irish landlord in the future more difficult still. In the Bill as it first left the Commons there was what may be called a presumption against the landlord. He was to pay for all, and every doubtful phrase was of such a character as to be capable of being worked against him; while the tenant could not, any more than he can now, be deprived by any ingenuity of construction of the benefits intended for him. The alterations have redressed this inequality to a very great extent, and the tenant is now left to his judicial rent, his practically free sale, and his stable, if not indefinitely, fixed tenure, without the parings and snippings of his landlord's goods which he might otherwise have got, and without the knowledge that if he goes into court it will be with a presumption in his favour, while his landlord can only enter it with a presumption against him.

It is not in human nature that those who, week after week for more than a quarter of a year, have had to note, to study, and to comment upon the intricate details and tortuous variations of the Land Bill, should part from it without a feeling of considerable relief. It has long been impossible to say anything new about it, though there has not been the least difficulty in saying things that were perfectly true. Yet it must be remembered—and, truism as it is, the necessity of the remembrance

about being passed—that the history of the Land Bill has not ended, but is just beginning. The tendency of Englishmen to regard a measure as soon as it is passed as part of the industrial Constitution of the country has no doubt a salutary effect in giving solidity and permanence to our institutions, but it is not seldom mischievous. Such a measure as this is essentially of the character of an experiment to be watched with care and its results noted anxiously and minutely—not a final settlement to be accepted and thought no more about. That the agitators who have made it inevitable, save at the risk of a dangerous alternative, have not the slightest intention of taking it as a discharge in full of their claims has been all along evident. To Mr. PARNELL and his friends it has been simply an instalment—an instalment which has the advantage of heartening those who want and weakening the resistance of those who have. The only thing left in doubt is how far the constituents of these agitators will continue to support them. This is hardly the place to discuss that question, but it is impossible to ignore the fact that it is a pressing and an important one. On the other side, and also waiting practical solution, is the question of the actual economical and social working of the Act. The solution of this will necessarily consist of three progressions or stages. There will first be the question how far the tenants now in arrear and recalcitrant will submit to the arrangements provided by the Bill—a submission which, be it remembered, will be inconsistent with the principles of the Land League, yet without which they will be deprived of the offered benefits, and, if the Act be strictly carried out, of their holdings. The second stage will be the vast undertaking of revaluing the rental book of Ireland. The third will be the future working of the principles of sale and tenure contained in the Act. Enough has been said before on the too probable dangers to which these successive stages are exposed. It need only be added that the history of their actual progress will be the history of the most remarkable economic experiment ever yet attempted. Neither in France, nor in Germany, nor in Russia, in all of which countries great revolutions in the tenure of land have been effected during the last century, has anything been attempted so complicated, and, what is more, so hazardous. For the last state of a peasant proprietor can hardly be worse than the first state of a serf. But the last state of an Irish tenant face to face with the tender mercies of the usurer and the law would be very much worse than his first state subject only to the capricious but customary indulgence of a landlord.

#### FAIR TRADE.

THE Conservative party is not in a prosperous condition; but for many of the causes of its depression its members are not directly responsible. It is scarcely their fault that they are outnumbered, that they are assailed by popular clamour, or that the interests which it is their mission to defend are incessantly threatened by an impulsive Minister. It is a graver misfortune that a considerable section of their body is placing itself deliberately in the wrong. The advocates of fair trade, which is a newfangled name for the negation of free-trade, are doing their utmost to bind the party to a ruinous association with untenable doctrines. A private householder would be thought insane if he attempted to counteract a decrease or stagnation in his professional receipts by dealing with more expensive shops; yet the same process is recommended by a set of theorists who have persuaded themselves that the industrial classes are dissatisfied with the commercial policy of the last forty years. DEMOSTHENES compared the Athenians of his time to an awkward pugilist, who always shifted his guard to the place at which he had last received a blow. There is not less simplicity in the attempt to revive the manufactories of Bradford by imposing duties on imported corn. It is true that as long as the Government is, by no fault of its own, committed to the anomalous task of negotiating a commercial treaty, the power of increasing such taxes as the duty on French wines may be justifiably held in reserve for diplomatic purposes; but, if the tariff were once settled, it would not be the interest of the English Government to use the liberty of increasing duties which it might have retained. It seems that the chances of concluding a moderately satisfactory treaty are not unfavourable. In this respect the economical errors of the English

fair-traders may possibly have produced a beneficial result. The French Government must by this time have ascertained that the industrial community in England is not so eager for a treaty as to be willing to accept flagrantly unreasonable conditions. The English Ministers have more than once declared that they will neither allow any branch of trade to be destroyed, nor assent to a treaty more injurious to commerce than the Convention of 1860. Mr. RITCHIE himself could scarcely insist on the stipulation that the tariff should in every instance be exempt from increase. The question is whether the new treaty will, on the average, be as tolerable as the old.

The advocates of retaliation are never tired of convicting Mr. CORDEN of a want of foresight. There is no doubt that his sanguine hopes of converting the world to his doctrines have thus far been falsified; but a true prophet has often miscalculated the weeks of years within which his predictions are to be accomplished. Sooner or later the multiplication-table will pervade regions where men are still content to reckon on their fingers. Demonstrable truths never lose the ground which they almost always gradually gain. Russia and the United States regard with equal complacency the extension of absolute Free-trade over new districts in their dominions as they are conquered or settled. In France almost every considerable politician understands and believes the doctrines of political economy, though it is still thought expedient to humour the ignorance of universal suffrage. The MINISTER of COMMERCE is a Free-trader; M. THIERS has left no school of disciples behind him, though his confidential friend happens for the moment to preside at the Foreign Office. M. POUYSSÉ-QUERTIER is a member of a defeated party. MM. WADDINGTON have fallen into the rear rank of the dominant Republicans. It is not improbable that at the impending election some candidates may explain to rural constituencies that it is not for the benefit of the peasantry that iron, cotton, and wool should be artificially dear, especially as the demand for wine and other French products is necessarily checked by a protective tariff. If Mr. CHAMBERLAIN is rightly informed, the sugar bounty, which is the most perverse of all plans for interfering with the natural course of industry, has been already to a great extent modified, if not practically abolished. It is almost a matter of regret that the French taxpayer should no longer make a voluntary contribution for the benefit of the English consumer. On the other hand, it is true that the French Government proposes to subsidize a line of steamers from Marseilles to Melbourne; but it is not likely that so absurd a bounty on French manufactures destined for a special port will be long continued.

Mr. RITCHIE, representing the comparatively moderate fair-traders, repudiated any connexion with the promoters of a meeting which was lately held at Exeter Hall. It is to be regretted that so respectable and well-informed a politician as Sir ALGERNON BORTHWICK should have placed himself at the head of a wild and hopeless agitation; but the preachers of extreme doctrines have almost always the advantage of exceptional consistency. Mr. RITCHIE recommends retaliation to an extent which would leave it practically inoperative, while the fair-traders of Exeter Hall have no hesitation in proposing the re-establishment of a Corn-law. If such a measure were practicable, it is barely possible that it might affect the commercial policy of the United States. In the negotiations with France, a corn duty would have little influence, because in ordinary years there is no considerable French importation. It is but an idle employment to discuss the probable consequences of a measure which would be peremptorily rejected if it were seriously proposed. In this instance prejudice and tradition are on the same side with sound economic principle and with material expediency. The proposal of a duty on corn would arouse dangerous passions, while it could not be defended by moderately plausible arguments. The Exeter Hall scheme is much more anomalous than the old Corn-law, which was intended to secure in perpetuity prices which were supposed to be moderately remunerative. The fair-traders, on the other hand, would impose a duty for polemical objects on the understanding that it was to be removed as soon as other countries are induced to establish reasonable tariffs. Protective legislation necessarily creates artificial interests, on which a remission of duties must have a ruinous effect. A combative tariff, after promoting the investment of capital in agriculture, and after raising the market price of land, would, on the Exeter

Ball theory, be abolished in return for the admission of English manufactures to French or American markets. The benefits which might in that case be conferred on Bradford or Sheffield would be no consolation to land-owners or farmers.

It is, perhaps, natural that an Opposition weak in numbers, and not in sympathy with principles which are for the moment popular, should be ready to ally itself with any section of the majority which may be disposed to separate itself from the bulk of the party; but it is not for the benefit of the Conservative cause that it should seek to profit by a passing delusion. In the House of Commons Mr. NEWDEGATE enjoys the proud distinction of being the only avowed and consistent advocate of Protection. In the worst of times he never became a convert to the doctrines of the Corn Law League; and he now regards with excusable complacency the tardy fulfilment of his own prophecies of the damage which would be inflicted on the landed interest. As he announced when the great wheat districts of the West were still included in the wilderness, and when the importation of cattle in Atlantic steamers had not yet been contemplated, English producers are undersold, and they are not likely to recover their former position. A monopoly of home supply would have averted the evil which has overtaken one class of the community at the cost of intolerable injustice to the rest. The anomaly might have been permanently possible if the land of England had been occupied by two or three millions of freeholders. A few thousands of large proprietors, if they had resisted change, would long since have been swept away. Mr. NEWDEGATE would scorn to enlist himself among the fair-traders who persuade themselves that their doctrines may be reconciled with economic orthodoxy. A staunch Protectionist must despise the pretence of helping the manufacturers by conferring a temporary and precarious boon on the landowners. It is not worth while to buy at such a price the votes of malcontent artisans in a few towns which are specially situated. It may be hoped that the revival of trade which is indicated by the returns of the Clearing-House and of the Railway Companies will silently put an end to a feeble agitation. It may be remarked that the leaders of the Conservative party in the House of Commons have never countenanced the fair-trade movement. Sir STAFFORD NORTHCOTE has on more than one occasion publicly denounced the fallacies which amuse a section of his followers. Mr. W. H. SMITH may be trusted to adhere to the principles which he has always professed. Lord BEACONSFIELD, shortly before his death, denounced on grounds of political expediency or necessity an agitation which he might perhaps in other circumstances, and at an earlier period in his career, have not been unwilling to encourage. Mr. RITCHIE himself would repudiate the doctrines which are maintained by Mr. CHAPLIN and Sir ALGERNON BORTHWICK.

#### MEXICO.

A CORRESPONDENT of the *Times* has lately given an elaborate, although possibly a highly-coloured, sketch of what the great railway financiers of the United States are doing for Mexico. There are two great enterprises on foot, to which a third is on the point of being added. It may be said briefly that the Americans are being good enough to cover Mexico with railways. There is the great Central Railway from the city of Mexico to the frontier and thence to Kansas, and there is the great National Railway from the city of Mexico to the frontier, and thence to Texas. Each of these lines is a prolongation of a large existing system in the States, and is in the hands of capitalists who have done enough to make it probable that they do not lightly talk of schemes, however gigantic. And these schemes are very large, for besides the main lines there are numerous branches, and each of them contemplates a branch to the Pacific as if a branch to the Pacific was a mere nothing. The total length contemplated by the National Railway is no less than 2,500 miles, and the intended extent of the Central is about 1,700. We may thus speak in round numbers of a total anticipated length of 4,000 miles. The Central line is of the standard gauge, and the National line is of the metre gauge. Taking one with the other, it is impossible to reckon on the cost of construction and equipment, apart from all watering of stock and the profits of financiers, as less than 5,000*l.* a mile. This is a very low estimate

according to English experience; and it must be remembered that in Mexico the cost of the freight of a large portion of the materials must necessarily be very heavy. But, even if only 5,000*l.* a mile is taken, this, on 4,000 miles, means an outlay of twenty millions sterling. The Americans do not mean to find all this money themselves. They are to be helped, and very largely helped, by the Mexican Government. A subsidy is to be given them, which varies not only with each line, but with different parts of the same line, but in no case falls below 2,500*l.* a mile. Thus, if the total cost of construction is taken at twenty millions, the Americans would have to find ten millions and the Mexicans would have to find ten millions. The total revenue of Mexico is between three millions and three millions and a half per annum, and there has hitherto been generally a deficit. The deficit does not perhaps now exist, for the country has had peace for some years; and Mexico may be said to be now paying its way, although there is certainly no surplus. In what time it is thought probable that the National and Central systems should be finished is not stated. But nine years may perhaps be considered a reasonable time. If so, Mexico would have to give these enterprising foreigners in nine years three whole years' revenue. Of course, nothing in finance can be pronounced beforehand to be absolutely impossible; but the world has hitherto been accustomed to talk in a depreciatory way of Mexico. The world would certainly have to change its tone, and allow that Mexico was behaving most handsomely to foreign capitalists, and was displaying infinite financial ingenuity, if it showed itself able and willing to go without any revenue at all every third year, and to hand over all its receipts to the adventurous makers of railways.

But even these two vast systems of railways are not enough for the Americans. A third scheme is being started, which also is in the hands of men of great financial position, and the direction of which is adorned with the names of persons as eminent as General GRANT, late President of the United States, and General DIAZ, late President of Mexico. As the other two great lines supply the wants of the north of Mexico, this is to supply the wants of the south. It is to start from the city of Mexico, and go in a south-westerly direction to the town of Oaxaca, whence it is to branch, on the westward to the Pacific, and on the eastward to the Atlantic, touching the sea, not only at Vera Cruz, but at a new port, which it is proposed to construct at a point on the coast where there is said to be a safer anchorage than Vera Cruz affords. The holders of the concession have also the astonishing privilege of going "southward to the frontier of Guatemala, if desired." The length of the line contemplated, short of this ambitious extension, is 800 miles; and, if this line could also be made for 5,000*l.* a mile, a further expenditure of four millions would be involved. The holders of this new scheme are more considerate to the Mexicans, or more independent of them, as they have asked for no subvention, and prefer to make the line for themselves, and, in return, to under no limitations as to their tariffs. The Americans are to find all the money that is needed, and it will be very interesting to them to learn what will be needed, for that will teach them, among other things, where their wonderful line is to go. It may be safely said that no one connected with the scheme has the faintest notion what kind of country fills up the space between Oaxaca and the Pacific. The first step to be taken was to send engineers to be the precursors of civilized man in wandering over this unknown region. The surveys which are now being made are, however, sure to show that a railway can somehow be made if any one likes to make it. With money a railway can be made anywhere, and the Americans will get from Oaxaca to the Pacific if they wish. But that they will get there cheaply is beyond belief to those who consider that the formation of the mountain ranges on the West Coast offers very serious difficulties, and that the materials must be transported at considerable cost from the Atlantic, or sent round to the Pacific coast. Still, at one price or another this new line, as well as the two established lines, will be made, if the Americans persist in what they have undertaken. And they are already doing something much more than the mere talking of great schemes would imply. The Central and the National lines are hard at work. They have made a good start both at the Mexican and the American ends, and if the statement that by the end of this year the National will have 500 miles in order for work-

ing is carried out, no one can deny that there has been a most striking display of energy and of the command of capital.

If it is asked whether the vast amount of capital which it is intended to apply to the construction of railways in Mexico will continue to be found, and whether the railways when made are likely to pay, we must first look at what is being done in the United States themselves. The new mileage laid down last year exceeded that of any year since 1871, more than 7,000 miles of new railways having been built in 1880. This was 2,500 miles in excess of what was constructed in 1879, so that the mere excess of last year over the year before equals the whole length of the longest Mexican line. The nominal cost of the new lines was 10,000*l.* a mile; this would give a total expenditure of seventy millions. The real cost was, it may be presumed, much less; but it would be a low estimate to compute the actual outlay at forty millions. To people who spend on their own new lines forty millions in one year it must seem a trifle to spend ten millions, or, if the Mexican Southern line is taken into account, fourteen millions, in several years. Even if the Mexican Government did not pay a farthing of the subventions promised, the United States would easily make up the deficiency; and it would surprise no one acquainted with Mexico to learn that the directors of these undertakings rely very little on the subventions promised, and are content to look forward to the position of being creditors on a very large scale of a Government which they may hope to be able to treat as great and strong creditors are in the habit of treating small and weak debtors. The receipts on the American railways even in the far West are highly satisfactory. The National Company has already more than eight hundred miles at work in Colorado and Utah, and it is stated that its system is taking an average of 30*l.* per mile per week, and is worked at 50 per cent. of the gross receipts, which leaves a net income of 8 per cent. on a capital of 10,000*l.* to the mile. This is more than a satisfactory result. It is a very astonishing result, and the only question is whether anything like the same result can be attained in Mexico. The conditions are not at all the same. The American railways thrive because everywhere they carry with them new settlers, with whom there is no one to interfere, who are all of European descent, who possess capital and energy, and who are protected by American law and by the general determination of American citizens, except in some wild regions where the desperado go in advance of the orderly, to see the law respected. Mexico is an old country. It has been for three centuries under the dominion of Spain; it is inhabited by an aboriginal population, very poor and very superstitious; all the land belongs to some one, and the first thought of the inhabitants outside the towns, which are for the most part poor, decayed, stagnant places, is to shoot a new comer, unless it answers better to rob him. On the other hand, the natural resources of Mexico are quite equal to those of the Western States of the Union, and if the Americans can dominate the Mexicans, they will make them grow rich after the American fashion, whether they like it or not. Probably they will dominate them; but many of those who know Mexico best think that this domination will not be established except after a painful struggle. It must be said, however, that the very scale on which the Americans are working, or are prepared to work, lessens the danger. They will impose themselves so rapidly and at so many points, that the country may be transformed before it thinks of resisting.

#### COURTS OF APPEAL.

**T**HE permanent arrangement by which the Master of the Rolls is to preside in the Court of Appeal, though it renders the gradations of judicial rank more symmetrical, may perhaps have been suggested by the peculiar qualifications of the present incumbent of the office. The Master of the Rolls has from ancient times held the third place among the judges, taking rank immediately after the Chief Justice of England; yet, when it was found necessary to increase the strength of the Equity Bench, and to relieve the Lord Chancellor of a portion of his duties, the Master of the Rolls continued to be a Judge of First Instance, while the Lords Justices exercised the functions of a Court of Appeal. It happened

that for some years the new tribunal consisted of lawyers whose authority was regarded by the profession as higher than that of the Courts below, and the relation between original and appellate jurisdiction had perhaps not been fully considered. In the times of Lord ELDON and his predecessors the Lord Chancellor sat almost daily in his own Court, and Common Law appeals were then and long afterwards heard in the Exchequer Chamber by judges of the same rank with those who had given judgment in banc. The present LORD CHANCELLOR seems to incline to a partial revival of a practice which was abolished by the Judicature Act; but he has already withdrawn the proposal of associating three ordinary judges, elected by their fellows, with the Court of Appeal. No part of the modern judicial organization has worked more satisfactorily than the Appeal Court, practically consisting of the Lords Justices sitting in two divisions. The Lord Chancellor has of late, when his other avocations allowed of his attendance, supplied a casual vacancy in the Court, and the Lord Chief Justice and the Master of the Rolls have less frequently given their assistance. Hereafter the Master of the Rolls will preside in one of the divisions; but for the present the Lord Chief Justice will continue to exercise original jurisdiction in the civil and criminal courts. It is not impossible that in some future rearrangement the chief Common Law dignitary will also be transferred to the Court of Appeal. It is no objection to legislation in matters of this kind that it is tentative and gradual. The comprehensive scheme of the Judicature Act has, on the whole, been successful; but it would have been surprising if there had not from time to time been occasion for modification of details.

An intermittent controversy on the comparative importance of original and appellate jurisdiction had preceded the introduction of the LORD CHANCELLOR'S Bill. The suppression of two out of three of the great Common Law offices was opposed by some of the judges on the ground that, in their opinion, the highest dignitaries ought to be, as formerly, placed in immediate contact with the ordinary administration of justice. The personal qualities of judges, as distinguished from their strictly legal attainments and aptitudes, are perhaps most conspicuously exhibited in dealing with causes and trials. Law Officers who were habitually promoted to the places of Chief Justice of the Common Pleas and Chief Baron were often more remarkable for general ability and for knowledge of the world than for profound legal learning. The arguments for the retention of title and rank, which had become dissociated from the presidency of separate Courts, were too subtle and far-fetched to prevail against a more symmetrical arrangement. The great majority of laymen would assume that an appellate tribunal ought to be higher in rank and in general estimation than the Courts of which it revises the decisions. Lawyers understand better the greater complication and difficulty of original jurisdiction; but the majority of their number would acquiesce in the same practical conclusion. It is in the highest degree important that law should be both just and certain; and a system of jurisprudence which depends mainly on precedents requires for its construction and maintenance the highest ability which can be obtained. The acknowledged efficacy of the present Court of Appeal results from the great ability and learning of its principal members. It has suffered a great loss by the death of Lord Justice JAMES; and it is understood that another judge of extraordinary vigour and ability is, after many years of valuable service, about to retire. It is not surprising that the LORD CHANCELLOR, who is responsible for the competency of the Court, should be anxious to maintain its character by the addition of a member who has no superior in judicial reputation. Future vacancies must be supplied as circumstances may allow from the Bar or the Bench.

The extraordinary facility and promptness which have enabled the MASTER of the ROLLS to keep down the business of his Court will be no longer required when he takes his place as a Judge of Appeal; but the combination of intellectual activity with profound knowledge of the law will give the necessary authority to his decisions. In common with the majority of his judicial colleagues, Sir GEORGE JESSEL is, unlike many of his predecessors in former times, anxious to do justice in each particular case rather than to refine on the nice analogies of law. Of one of the ablest and most learned judges of the last generation a satirical epitaph recorded how *leges Angliæ in absurdum reduxit*; and the

accomplishment of such a task required much logical acuteness. More recent judges have learned to suspect that a plausible inference which involves the infliction of obvious wrong on a litigant is likely to involve a fallacy, unless, indeed, it necessarily results from careless statutory legislation. It is much more true at present than in former times that law approximates to the perfection of common sense. Within living memory certain classes of legal questions were scarcely ever decided on their merits. Like the early interpreters of the Twelve Tables, judges were almost always interrupted, before they approached the merits of the case, by the discovery that one or both the parties had failed to comply with the necessary forms. About forty years ago, through the co-operation of feeble or super-subtle judges with audacious advocates, the evil had reached its climax, and caused the beginning of a wholesome reaction. The pages of *MERSON* and *WELBY* record some of the most remarkable results of perverse ingenuity. The old system of Common Law pleading was a science in itself, having few points of contact with practical right. The present mode of stating a cause of action or a defence is more intelligible to laymen; but some experienced practitioners doubt whether it is not unnecessarily diffuse. It is even possible that pleadings may be wholly discontinued. Any changes which are now made either in the constitution of the judicial Bench or in legal practice are, at least, intended in good faith to make the law simple and certain. The great increase in the expense of litigation, which has been one of the consequences of the Judicature Act, is attributable to the multiplication of stages in a suit or to other causes which may be removed.

The continuance in Common Law actions of the right of appeal to the Court in banc is generally deemed unnecessary. Before the passing of the Judicature Act, the Courts sitting in banc discharged the greater part of the duties which now devolve on the Court of Appeal. The cases which were afterwards carried to the Court of Exchequer Chamber were comparatively few. There seems to be no reason why an appeal should not be taken direct from the judge sitting at Nisi Prius to the Court of Appeal. The future efficiency of the Court will depend on the care and sound judgment with which appointments are hereafter made. A long succession of Chancellors have established the laudable custom of appointing ordinary judges for the most part on strictly professional grounds. In some instances it has been thought necessary to allow claims founded on Parliamentary service; but the political opinions of the majority of judges are in many cases wholly unknown, even to the Bar. It is highly desirable that the same rule should be applied to members of the Court of Appeal. Their first qualification will be a sound knowledge of law; and it matters little whether they possess the eloquence and adroitness of successful advocates. It is true that some of the greatest judges, such as the LORD CHANCELLOR and his immediate predecessor, and the present MASTER of the ROLLS, have been members of the House of Commons and Law Officers before their promotion to the Bench; but a capable Attorney-General would not always add weight to the judgments of a Court of Appeal. As a general rule, it is desirable that Lords Justices should, like several of the actual members of the Court, be selected from the ranks of the ordinary judges; but occasionally a member of the Bar attains a generally recognized pre-eminence, which may entitle him at once to the higher promotion. The authority of the court will be increased by the appointment of Sir GEORGE JESSEL to its highest rank. His successors at the Rolls may sometimes have been appointed for other causes than for their strictly judicial qualifications; but there is no reason why the ordinary members should object to the precedence of a Master of the Rolls or of a Chief Justice. It might be a cause for just regret if the high character of the Court of Appeal should hereafter be lowered by unfit appointments. Such a tribunal not only administers but makes the law.

#### THE SAILORS' STRIKE.

**T**HE sailors' strike is both unusually important and unusually instructive. Its importance of course lies in this, that while other trade quarrels affect the community only through the particular industry which they derange, a quarrel between sailors and shipowners may,

under certain circumstances, affect the community through the public service. The mercantile marine is in time of war the chief nursery of the navy. Under the system of training boys for the navy the ordinary wants of the public service are supplied without recourse to recruiting. But a system of this kind can only apply to a time of peace. Only a certain number of sailors are wanted every year, and as there is not employment for more than this number the object of the Admiralty is not to have more boys on their hands than there will be ship-room for when they become men. But, if we again find ourselves involved in a naval war, those men would immediately be in demand for the additional ships put into commission and to make good the drain of actual service. The choice would then of necessity lie between landmen and sailors employed in the merchant navy, and, unless the quality of the sailors had greatly altered for the worse, they would plainly be the best to take. Unsatisfactory relations between owners and seamen are exceedingly likely to lower the quality of the latter. It is a general complaint that the change in the conditions of the merchant service has already had a bad effect in this way. The use of steam has made seamanship less essential, and as the need of specific training has grown less, the proportion of men who have not the stuff in them to stand the test of specific training has grown greater. The shortening of the voyage, due to the same cause, has helped on this result. There are many men who will sign articles for a short trip just to see how they like the life, and if this element has a large place in a service the deterioration in it may be very great without the fact making itself apparent to any one not conversant with the trade. But if a war were to break out, the public would become painfully familiar with it. Men of the stamp just described would be very much less likely to enlist, and worth very much less when they did enlist. It would be almost impossible nowadays to reproduce the pressgang, and even if the need were great enough to overcome the immense popular objection that would certainly be felt towards its use—an objection which with the present suffrage would be conclusive so long as it lasted—the results obtained would be unsatisfactory. So long as the merchant navy is manned by good sailors the average haul of the pressgangs will be good sailors. But if the merchant navy has only a few good sailors here and there, it will be merely a chance whether the pressgangs get hold of them. Even if the men showed an unexpected amount of patriotism, or were tempted to join by high pay or large bounties, they would be worth but little at first, and might be worth but little to the end. It is plain that if seamen generally are dissatisfied with the pay or the treatment they get on board merchant ships, the best men will be on the look-out for opportunities of leaving the service, and the deteriorating process which had its origin in other causes will come to perfection by reason of this one.

It does not appear, however, that the strike in the Port of London would have become at all serious if the question in dispute had related only to wages. The men on strike have refused, indeed, to take less than 3*l.* 5*s.* a month in sailing ships and 3*l.* 15*s.* a month in steamers; and in one instance the customary method of proving the goodness of their cause was resorted to, and a sailor who had accepted 2*l.* 10*s.* a month was set upon and severely beaten. If this, however, had been the only point in the controversy, the strike might have ended almost as soon as it had begun. Some, at all events, of the owners at once raised the pay to the amounts asked, and as crews seem to be in demand it is probable that the remainder would shortly have followed the lead thus given. Into the rights and wrongs of this part of the dispute it would be useless to enter. When the problem how to ascertain what is a fair day's wages has been solved on land, we may be in a condition to determine what is a fair month's wages at sea. Another point, moreover, has been raised by the men as to which it is possible for outsiders to have an opinion. Among the complaints which have been made is one relating to the quantity and quality of the food supplied on board ship. The men allege that they do not get as much food as they want, and that what they do get is not of the right kind. A speaker at one of the meetings said that in a leaky ship he had had sometimes to pump for hours in the teeth of a gale, and that this was hard work "on a bit of salt horse and a biscuit." This same man pointed out that in these days of preserved provisions something more should be done to provide

sailors with better food. Undoubtedly, if the dietary on board merchant ships is still what it was before preserved provisions came into use, shipowners have not consulted their own interests. Men do their work better when they are well fed, and they are more likely to quarrel with their wages when their stomachs are empty than when they are full. It ought to be an advantage to both parties that the conditions of the service make it necessary that the men's food should be provided by the shipowners. The provisioning of a ship can be done more cheaply than would be possible if the same number of men had to feed themselves; and, if the masters take care to give the men the full benefit of this difference, a sailor's life ought in one important respect to be one of very much greater comfort than it used to be. It is to be feared that in some cases the masters have looked upon any saving they can effect in the value of the provisions supplied simply as so much knocked off the expenses of the voyage. This is a short-sighted policy, even where wages are concerned, and it is far more short-sighted where the food is concerned. The meanness of the owners is brought home to the men every day, and it touches them upon a point on which they feel keenly.

It is not, however, either about wages or about food that the complaints of the men are loudest. The thing that most excites them is a change in the law which was made entirely for their benefit. What it was intended to do was explained to a deputation by Mr. CHAMBERLAIN on Monday. The Merchant Seamen Act of last year, which came into operation on the 1st of the present month, abolished the advance note. "The advance note system," said Mr. CHAMBERLAIN, "was a system under which an advance of wages was given by the owner on condition that the seaman was put on board." The keeper of a low lodging-house was willing to keep the sailor while he was on shore, because he knew that if he saw him on board his new ship he would be able to draw his first month's wages after the ship had sailed. This system, Mr. CHAMBERLAIN went on, "was approved of by the crimps because it placed the seamen almost entirely in their hands," and "by a certain class of owners, who say that it saved them trouble because they had nothing to do with the shipping of the sailors." The better class of seamen naturally disliked the advance note, and the Amalgamated British Seamen's Protection Society have protested against any return to it. It turns out, however, that the less provident seaman finds himself in very great straits now that he has no longer any security to offer to the boarding-house keeper. He has landed from his last ship without any money, or he has spent the money paid him on his return, and he is at a loss how to live during the time that he is looking for a ship. The boarding-house keepers are naturally unwilling to supply him with food and lodging, because they can only be repaid when he finds a ship. But as soon as he finds a ship he may be off in her, and in that case all that the creditor has to trust to is the seaman's honesty. Even when this is in itself a sufficient security it is not equivalent to payment on the spot, unless the sailor can draw his wages in advance. Consequently, the boarding-house keepers, since the 1st of the month, have met every application to be taken in with a demand for a week's payment in advance. The lesson to be drawn from this part of the case is the difficulty of compelling men to consult their own ultimate interests. The advance note system plainly ministered to improvidence, because it did away with one of the natural penalties by which improvidence would otherwise have been attended. The sailor had no motive to put by money for his support while on shore, because he knew that he could get supported on the security of his future earnings. It would have been an unmixed gain to him to have been kept from thus pledging his future earnings, if at the same time he could suddenly have been induced to save money out of his present earnings. But, though legislation can ensure that a man shall suffer for his folly, it has no means of making him wise. Consequently, when the Act came into operation, the improvident sailor found himself brought very near to starvation. He had to find a ship, and he had not the means of living while he was looking for one. An advance note is "a document authorizing the future payment of money on account of a seaman's wages, conditionally on his going to sea, and made before those wages have been earned," and all documents purporting to do this are void from the 1st day of August, 1881. Mr.

CHAMBERLAIN told the deputation that there was nothing to prevent a sailor from asking the shipowner for an advance of wages, and from bringing the boarding-house keeper on board with him to receive the payment due to him. If this plan is found to work well, it will pretty well answer the purpose formerly served by the advance note. But it is not quite clear in what respects it will be superior to the advance note. It is even conceivable that, inasmuch as the boarding-house keeper's prospect of getting his money will not be quite so certain as it used to be, he will compensate himself for the increased risk by a higher tariff of charges. Bad security will in this, as in other cases, mean high interest. When the men see that nothing but an Act of Parliament could give them back the advance note, they may have the good sense to bring the strike to an end. It will not have been without its compensating good if it inspires Parliament with a wholesome distrust of its power to give its good intentions in matters of this kind the precise effect that it wishes them to have.

#### CYPRUS.

THE Parliamentary papers recently issued relating to Cyprus, while they reflect credit upon the local authorities, cannot be said to place the action of the Government with regard to the island in a very favourable light. Sir ROBERT BIDDULPH's despatches show that he has honestly and earnestly endeavoured to do his best in administering its affairs; the Colonial Office, on the other hand, has apparently done its best to thwart any designs he may have conceived for the improvement of the dependency over which he presides, and to have determined beforehand that Cyprus shall be, and remain, insolvent. A correspondence has been laid upon the table respecting the application of the surplus revenue to the satisfaction of the claims of the Turkish bondholders; but it seems that there really is no surplus revenue at all, for when the stipulated proportion of it has been paid to the Porte, a considerable deficit is left, which is to be made up out of the pockets of the British taxpayers. As a strategic position Cyprus needs some considerable expenditure, though, according to Admirable HORNBY, not so much as has been thought, to fit it for the command of the Suez Canal, to which it is geographically destined; as a profitable speculation in a commercial point of view no one for a moment regarded it, and, indeed, no one would have dreamed of our occupying it on any such grounds. As it is, we are in possession of it; and, if we are to retain it, we must obviously try to make it pay its way. This is exactly what the present Government decline to do. The Secretary of State for the Colonies asks for a grant to supply a deficit, being apparently glad to set the dependency before the country as in a hopelessly bankrupt state, but he will neither sanction assisting it with advances to develop its resources nor make it possible for it to procure the money elsewhere.

The telegrams which have from time to time appeared in the columns of a contemporary would lead the public to suppose that a widespread agitation is going on in the island with a view to bring about its cession by ourselves and ultimate annexation to Greece. The latest advices from Cyprus do not confirm this intelligence, but rather show that the Cypriotes desire nothing better than to be assured that they will remain under English rule, and that the home Government should once for all contradict the *canards* which are being industriously circulated by a small clique of *soi-disant* Greek "patriots" and speculators. It may be added that neither geographically nor historically has the present kingdom of Greece the slightest valid claim on Cyprus. One grievance, indeed, does exist; the island is administered according to Turkish law, and the inhabitants urgently demand that the Moslem *Cadis* should be replaced by English magistrates, from whom, they believe, they would obtain more substantial justice. Burdened as it is with the heavy tribute paid to Turkey, the present financial position of Cyprus is far from satisfactory; but there is no doubt that, were the resources of the country properly developed, the balance between income and expenditure would very soon adjust itself. The grant of 77,000*l.* which is asked for would not do more than cover the existing deficit, and a larger outlay in public works is required than the Imperial Treasury would perhaps feel

justified in advancing. The obvious suggestion is that, if the island really has such capabilities of development, it should be easy to raise a loan upon the market to meet the exigencies of the case. This is exactly what ought to be, and no doubt would be, done if there were proper security to be had. Already the value of land has increased immensely since the British occupation; but as it would immediately fall again were we to give it up, and as, rightly or wrongly, an impression prevails that the present arrangement is only temporary, no one can be found to take up such a loan. The Government seem, indeed, to be doing their best to depreciate the value of the securities which Cyprus has to offer by throwing every obstacle in the way of improvements being carried out. The most crying needs are for a harbour at Famagosta to develop the trade of the island, for scientific cultivation and preservation of the forests, which have been allowed to get into a very bad state and need thorough replanting, and for the drainage of the marshes which are now so fruitful a source of malarious disease. The expenditure which the construction of the harbour would involve is evidently considered by Lord KIMBERLEY as out of the question, as he even declines to accede to the application for the outlay of five thousand pounds for the last-named object. He considers the success of the experiment of planting the *Eucalyptus globulus* in Cyprus as very doubtful, although the opinion of experts on the spot, and the brilliant success actually obtained in the reclamation of some of the worst of the Roman marshes by these means, are directly opposed to his opinion. As for the woods and forests, the Colonial Secretary thinks that they should be "left to recover themselves by the natural means of reproduction," and that it is sufficient to adopt "measures of protection" for what timber does remain. To be logical, Lord KIMBERLEY should bring in a Bill for the Abolition of our own Woods and Forests Department as entailing unnecessary expense, and should insist upon the English and Indian forests being left to natural means of reproduction. In England, perhaps, the full measure of folly which such a dictum implies is imperfectly appreciated. France has been forced to acknowledge and to endeavour to remedy the evils which a reckless destruction of timber brings about, and Germany has developed and matured an admirable system of forestry, with the best results. But we must go to the East for evidence of the frightful desolation which neglect or wanton destruction of trees can cause. A large portion of what is now desert to the south of Palestine is thickly strewn with the ruins of once populous towns and villages, which were formerly well watered and planted with trees. The incursions of Kharezmians and other devastating hordes have driven out or exterminated the inhabitants; the forests, uncared for, have dwindled away; and the periodical floods from the mountains have swept off the few plantations which remained, and which, when properly cultivated, acted like sponges, and retained the water which formerly fertilized the district. Trees not only serve this useful purpose, but, as is well known, actually attract the rainfall; and, where this is diminished, and an Oriental sun can exercise its influence undisturbed, a few years suffice to turn a fertile tract of country into an arid desert.

The necessity for a grant in aid of the revenues of Cyprus will be doubtless looked upon as conclusive proof of the hopeless insolvency of the island. Yet Sir ROBERT BIDDLETON would appear to have made sufficient financial arrangements to meet the requirements of the present year. The revenue for the current year is one hundred and eight thousand pounds, while the expenditure, including ninety thousand pounds to be paid to the Porte, is two hundred and thirty-five thousand pounds. This leaves an apparent deficit of forty-five thousand pounds; but it must be remembered that by the Convention with Turkey the tribute was to be paid in *métallique*, and by forwarding the amount due to the SULTAN in that coinage the High Commissioner saved a sum of no less than forty thousand pounds, so that his Budget showed scarcely any deficit at all. In insisting, as the Government did, upon the payment of the difference to the Porte, they were certainly acting in accordance with sound principles, for otherwise Lord GRANVILLE could scarcely have insisted upon that portion of the surplus revenue of Cyprus which it was agreed should be applied to the reduction of the 1855 loan being paid at the rate of 120 piastres to the Turkish pound. It would never-

theless have been better for instructions to this effect to have been sent out beforehand, unless, indeed, it were the object of the Government to place the finances of the island in the most unfavourable light possible before the public. Whatever may be thought of the wisdom of the course pursued in taking over Cyprus, the duty of the Government with regard to it is now clear. They should either boldly acknowledge that they no longer think it desirable to retain it, or they should give the local authorities the chance of improving its condition, and enabling it to pay its way. To refuse to advance money in order to carry out necessary improvements, to prevent the possibility of obtaining money in the open market for the same purpose, and at the same time to dally with the machinations of an interested and utterly uninfluential clique, is scarcely a politic or reputable course of action. It may have the desired effect of making people discontented with and glad to get rid of the new acquisition; but it is scarcely fair to those who are entrusted with the administration of the island.

#### THE POST OFFICE REPORT.

THE Post Office is the one public department which now and then allows itself to lay aside the stateliness of demeanour which accompanies the habit of administration. Its Annual Report is to parliamentary papers what light comedy is to literature. It tells us what the department has been doing for the public, but it also lifts a corner of the veil which ordinarily conceals what the public does to the department. Considering how much pains the Post Office takes to carry our letters safely and quickly, it shows some want of gratitude in the writers that 27,000 letters should last year have been posted without any address whatever, that of these 5,000 furnished no clue to the name of the sender, and that 1,340 of them contained articles of value to the amount of nearly 5,000*l.* The steady growth of this practice seems to suggest that Mr. TOOTS's example has been improved upon in real life. Mr. TOOTS wrote letters which he never meant to reach their imaginary destination, but he does not seem to have thought of posting them without an address, still less of enclosing in them either money or jewelry. The habit, as the POSTMASTER-GENERAL politely calls it, of "transmitting animal and perishable matter still prevails." The facilities of making yourself unpleasant to persons at a distance which are furnished by postcards have not entirely displaced the blunter humour of sending them a dead rat. In warm weather it must be almost as bad to be the object of the mistaken solicitude for a distant correspondent which makes the Post Office a medium for the transmission of fish, sausages, and clotted cream. Mr. FAWCETT appeals to the public to discontinue a practice "so injurious to the health of the officers in one branch of the department." He might have added, as an argument likely to have more weight with the senders, that in one of the cases mentioned—live kittens—the practice is likely to be injurious to the health of the object conveyed.

The more serious contents of the Report deal rather with the subsidiary business of the Post Office than with its immediate function of carrying letters. It is as the national Savings Bank and the national Insurance and Annuity Office that some of the most useful work of the department is done. The experiment of making Government stock purchasable through the Post Office has been a decided success. Between the 22nd of November and the 31st of March—a period of little more than four months—382,139*l.* were invested in this way by 6,300 persons. Of this sum 151,465*l.* were merely transferred from the Post Office Savings Bank; but 230,674*l.* were specially deposited for investment, and may be taken to have been money which without the aid of the Post Office the owners would have found it difficult to turn into stock, and consequently might never have invested at all. Unfortunately for the rapid extension of the experiment, Consols have stood exceedingly high ever since it was begun. During the month of March, when they were at par, there was a considerable falling off in the number of investments. Notwithstanding the new way of disposing of money thus opened, the deposits in the Post Office Savings Bank have gone on growing. On the last day of December 1880 they amounted—including the interest accrued—to very nearly 33½ millions sterling, or nearly one million and

three-quarters more than on the last day of December 1879. The comparison between the proportion of depositors to population and the average balances due to each depositor in the three kingdoms respectively is curious. Probably most people would expect that in England, as the wealthiest and least thrifty country, the balances would be the largest and the proportion of depositors to population the smallest; that in Scotland, as a poor but thrifty country, the proportion of depositors to population would be largest and the balances due to them smallest; and that in Ireland, as a still poorer country, the average balance due to the depositors would reach the lowest point. Not one of these suppositions is entirely borne out by the facts. In England the proportion of depositors to population is far ahead of what it is in either of the other two. One person in every 13 has an account with the Post Office Savings Bank, whereas in Scotland only one person in every 53 has one, and in Ireland only one person in every 65. On the other hand, the average balance due to each depositor is higher in Ireland than in England—18*l.* 18*s.* 11*d.* against 15*l.* 10*s.* 4*d.*—and the former sum is more than double the average balance due to each Scotch depositor. About Ireland there is the further fact to be noted that “the increase of capital recorded in the previous year has not only been maintained, but has been augmented by 47,000*l.*, and is larger than any annual increase during the past ten years.” The explanation of this state of things is not given by the POSTMASTER-GENERAL, but it is easily found. During 1880 the Irish tenants did not fritter away money in paying their rents. Their obedience to the Land League left them in many cases with the amount due to the landlord safe in their pockets, and though some of it may have been wasted in natural exultation over this unprecedented state of things, a good deal of it, no doubt, was put by in case by some unexpected accident the rent should after all turn out to be recoverable.

Mr. FAWCETT describes with just satisfaction the success of the plan by which twelve postage stamps affixed to a special slip of paper are accepted as a deposit of a shilling. By the end of March—the plan having only been extended to the whole country on the 15th of November—223,000 new accounts had been opened in this way, and 576,560 slips of paper had been received. The department has been anxious to point out that the new scheme is intended not to supersede, but to act concurrently with, the old Penny Banks. As a matter of fact, however, an impression has grown up that the scheme has really converted the Post Office itself into a Penny Bank. Provided that those who have hitherto taken interest in Penny Banks transfer their superintendence to the provision and collection of the slips of paper, we do not see why Penny Banks in their old form should be continued. There is, however, ample room for the trial of a plan which is now in operation at Alnwick, by which the machinery of a Penny Bank is used for the purpose of buying annuities or policies of insurance. Hitherto the business in the former department of the Post Office has increased but slowly, and the rate of increase has not been always maintained, while in the latter it has largely though not steadily decreased. In 1880, 892 persons bought immediate and 41 persons bought deferred annuities. The former figures compare against 964 in 1879, 709 in 1878, and 745 in 1877; the latter compare against 49 in 1879, 50 in 1878, and 58 in 1877. As regards life assurance, 547 policies were granted in 1865—the year when the insurance department was opened—and this number has only twice been exceeded since. In the last three years the number of new policies have been 258, 226, and 229. It is plain that the principle of insurance has not yet come home to Englishmen. They are beginning to understand how to save money, but they have not yet learned to apply the principle to making provision for old age or death. This is singular, because both sick clubs and burial clubs—in one of which the benefit received is in the nature of an annuity during sickness, while in the other it is in the nature of an insurance payable at death—are exceedingly popular.

Two efforts to bring the Post Office Savings Bank to the very doors of the classes whom it is specially desired to benefit have been abandoned as unremunerative. In 1878 clerks were sent from country post-offices to attend at certain public works on pay days in order to give the navvies employed on them the means of putting by their

wages. The plan was tried at eight places, and 236 visits produced deposits to the amount of about 1,750*l.*, at a cost to the Post Office of something over 100*l.* In July 1880 clerks were sent once a week to about thirty villages lying at some distance from any Post Office Savings Bank, in order to ascertain whether there is any general want in outlying districts of additional opportunities for making deposits. Down to the close of October 23 villages had received 483 visits. Of these 161 had produced no result, while in the remainder 988*l.* had been deposited at a cost of 164*l.* This amount of business was not held sufficient to demand a continuance of either plan. As, however, the latter experiment resulted in the opening of permanent Savings Bank Offices at five of the villages, it may possibly be expedient to occasionally renew it in order to discover new centres of deposit. One fact is mentioned in the Report which we are really sorry should have been made public, as it will be made so very much of by Local Option orators during the recess. In March last Messrs. Bass and Co. proposed that a clerk from the Burton-on-Trent Post Office should be sent periodically to their brewery in order to give their workmen opportunity of putting their wages in the Savings Bank. As they offered to pay all the expenses incurred, Mr. FAWCETT consented, and offered to allow similar facilities to other firms on the same terms. Would that we could draw a veil over the result. “At the works of Messrs. Bass only nine deposits, amounting to 5*l.* 6*s.*, have been made in nineteen visits.”

#### THE FRENCH ELECTIONS.

M. GAMBETTA has addressed one meeting in Belleville and abused another. On the first occasion he was listened to and cheered, but it was alleged by his adversaries that this decorous reception of the great opportunist was entirely due to the very careful packing which the meeting had undergone. The behaviour of the electors at the second meeting gives some colour to this description of the method adopted at the first. Either M. GAMBETTA'S Committee did not venture to make the same arrangements on two successive occasions, or they were out-manœuvred by the opposite party. A builder's shed and the yard adjoining were early thronged by some ten thousand people, and by far the larger part of the crowd seems to have been opposed to M. GAMBETTA'S re-election. It is not easy to shout down M. GAMBETTA, but for once it was done. The curiosity to hear what he had to say which must have been felt by some of those present was powerless to gain him even a partial and interrupted hearing. He did contrive, however, to convey to the disturbers of the meeting, or rather perhaps the disturbers who had met together, the opinion which he had formed of their conduct and characters. They are drunken and irresponsible slaves who, after the vote of honest and loyal citizens on the 21st has avenged him, will return to their old obscurity. The drunken slaves were sober enough to dislike being thus described, and they took such effectual measures for drowning M. GAMBETTA'S voice that he thought it expedient to retreat. Of course no trustworthy inference can be drawn from what happened at this meeting as to the prospects of M. GAMBETTA'S re-election. The ballot, at least, secures freedom to those prudent citizens who wish to shout with the noisiest party and vote with the one which is most likely to win, and it is quite conceivable that among the loudest of M. GAMBETTA'S assailants on Tuesday may have been some who intend to vote for him all the same. The belief that M. GAMBETTA will shortly be in office is probably not shaken by anything that has happened during his canvass, and even an Irreconcilable may see advantages in having the PRIME MINISTER as his representative.

At the earlier meeting M. GAMBETTA did obtain a hearing, and he made a double use of his opportunity. He said many things, and some of the things he said could be made to carry many meanings. No man is a more perfect master of the useful art of making his words conceal his thoughts. He wished to carry the electors of Belleville with him, and he wished also not to make the work of governing the country harder by reason of any promises that he might make to them. He began the constructive part of his speech with the reform of the magistracy. That is a measure, he declared, of the first importance. “You cannot preserve respect for the law, if

"you do not preserve in the public respect for those who administer the law." When it came to defining the reform which should have this antiseptic effect, M. GAMBETTA was as vague as he ordinarily is. So he was as regards the army. He does not object to see the term of service with the colours reduced to three years, but he would rather not see it done just yet. So he was as regards the Church. Clericalism, of course, is still the enemy; but it is not quite clear how the enemy is to be met. M. GAMBETTA is of opinion that the question how to fight the Church demands a long and minute inquiry. Long and minute inquiries have been known before now to have very little result. The Concordat must be examined in order to see how little it is possible to give under it. The titles on which religious corporations hold their property must be strictly looked into, so that "this country of the Gaals," composed as it is of peasants and small proprietors, may not be shocked by the spectacle of other people's riches. Even the property which the Church holds legitimately, if there be any such, must have the eyes of the tax-gatherer turned towards it. Hitherto any inquiries that have been made in this direction have been merely inquiries of amateurs; now the expert must be called in, and the property of the Church in every department in France must be exactly valued and proportionately rated. Still, all this does not involve any necessary approach to the separation of Church and State by the suppression of the Ecclesiastical Budget; and, as this is a point upon which the Extreme Left feel strongly, M. GAMBETTA had to see how near he could go to abolishing the Concordat without actually abolishing it. The way he took to do this is singular, and tends to show how greatly M. GAMBETTA's view of what is open to him to do in the way of coming to terms with the Church has changed. Ten years ago he drew a marked distinction between the higher and the lower clergy. Of the former he did not think very much, but for the latter he had nothing but praise. They are at once priests and peasants, they spend their lives in ministering to the poor, and the aim of the Republic should be to raise and enfranchise and emancipate them. M. GAMBETTA's ideas of raising, enfranchising, and emancipating the inferior clergy are now extremely simple. He has discovered that the Concordat binds the Government to pay the salaries of the curés—that is, of the priests stationed in the principal town or village of each canton—but that it is silent as regards the far more numerous class of curates who serve the churches of the smaller villages. There are said to be some thirty thousand priests belonging to this latter class as compared with some three thousand belonging to the former; so that, if it be true that the whole of these might have their pay withdrawn without the letter of the Concordat being violated, a very long step would plainly have been taken towards the abolition of the Budget of Public Worship, and yet nothing have been done of which the Pope, as the other party to the Concordat, could exactly take hold. M. GAMBETTA must now be supposed to have quite given up the hope of winning the country clergy, and especially the poorest of them, to the side of the Republic. The *vicaires* and *desservants*—the curates, as they would be called in England—have mostly nothing but their salary to depend on. The fees go to the curé, and, if they are without private means, the 25*l.* or 30*l.* a year which they get from the State is all that they have to live on. The suppression of this item in the Budget of Public Worship must close many village churches, and make thirty thousand peasants and members of peasant families the deadly enemies of the Republic. If M. GAMBETTA really means to take this step, he must set a much greater store by the support of the Extreme Left than it seems to deserve. If he is only pretending to mean it, he may find one day that he has underrated the memories of the clergy.

M. CLÉMENTEAU has also been making a great speech in Paris, which, at all events, cannot be charged with any undue moderation. But, thoroughgoing as his policy is, it is conceivable that the clergy may think it of the two less alarming than M. GAMBETTA'S. It is true he advocates the entire abolition of the Budget of Public Worship. But, if the curates are to have their salaries taken away, they may look with comparative indifference to an extension of the treatment to bishops and cardinals. Even those of the clergy who will retain their salaries under M. GAMBETTA'S project cannot well accept a version of the Concordat which leaves thirty thousand of their

brethren to starve on such chance payments as may be contributed by the frugal piety of the French peasant. Where M. CLÉMENTEAU parts company from M. GAMBETTA is in the degree of liberty he would give to the clergy when they have thus been reduced to a state of apostolic poverty. There is no inconvenience, he says, in allowing citizens freely to associate themselves together, to dress in white, black, or yellow, and to pray, work, or be idle in common. What is inconvenient is the payment out of the taxes of a religion to which many of the taxpayers are altogether opposed. Thus, M. CLÉMENTEAU is apparently willing to see the Church free and poor, while M. GAMBETTA would prefer to see it enslaved and poor. No doubt this view is hardly compatible with things that M. CLÉMENTEAU has formerly said. But, as he sees power and responsibility coming nearer, there will be much that he has formerly said which he will not care to be reminded of, and it is a very open question whether, in the long run, the Church would not be as well off under a Government of the Extreme Left as under one headed by an opportunist who is trying to conciliate the Extreme Left.

Perhaps, however, M. GAMBETTA will abandon his efforts in this direction now that he sees how ill they have been received. To all appearance, indeed, except in Belleville, where he has an immediate and personal object to gain, it matters very little whether he conciliates the Extreme Left or not. The new Chamber promises to be very much a reproduction of the last; and, if M. GAMBETTA had never opened his lips during the canvass, there is no reason to suppose that the result of the contest would have been very different from that which will be witnessed to-morrow. M. GAMBETTA has given some further pledges which will one day be brought up against him, and he has made the alienation of a powerful interest more complete. These are the only achievements of his canvass; and, as yet, the gain that they promise to bring him seems hardly worth the risks and sacrifices incurred.

#### THE NATIONAL PORTRAIT GALLERY.

THE presentation of the twenty-fourth annual Report to the Lords Commissioners of the Treasury from the Board of Trustees of the National Portrait Gallery affords much reason for public congratulation upon the success which continues to attend the institution committed to their charge. It grows and prospers, and every year shows an addition to its treasures, and an increasing development of its interest and claims on the Government. Founded in 1859, and for some years very insufficiently lodged in Great George Street, Westminster, the Portrait Gallery has since 1870 been provided with ample space, if not with absolute safe custody, at South Kensington; and it is not now likely ever to lack public encouragement and adequate support. The annual increment to its riches, which takes place under the management of its able and distinguished Trustees, aided by the learned and intelligent labours of Mr. George Scharf, the keeper and secretary, is always matter for favourable comment, and will gradually render the collection deserving of the nation whose worthies are represented in it. Indeed, there is not one of our public galleries which has higher aims, or provides more useful results. The history of England cannot be read in any more instructive or agreeable manner than by a walk among the portraits of its great men, explained as they are by brief biographical notices attached to the names, and illustrated in many cases by authentic specimens of their handwriting. They may be studied in their habits as they lived, and are so arranged as to form a consecutive series in which each person of note is seen among his contemporaries. The new and enlarged historical and descriptive Catalogue, prepared by the Secretary, and recently issued at the low price of one shilling under the authority of the Trustees, gives a longer and fuller account of the various pictures and sculptures in the Gallery. Taking this as a guide to the portraits, the visitor will obtain as much as need generally be known about their subjects, and can at once learn their characters and lives, their personal appearance and dress.

The compilation is well done, and is free from the defects of political partisanship which were so striking in the catalogues of the Loan Exhibitions of Portraits which took place in the same galleries some years ago. In any process of literary condensation, it is difficult to be brief without being dry, and not easy to select the facts and incidents which are to be preserved or rejected. In dealing too with men in so many positions of life, and with such varied surroundings, perfect accuracy cannot always be expected—or statements may be adopted which, although literally true, contain that which is likely sometimes to mislead. There is an instance of this in the short account of Lord Chief Justice Lee, who presided in the Court of King's Bench from 1737 to 1754. It is stated that in March 1754, on the sudden death of Mr. Pelham, the seals of the Chancellor of the Exche-

quer were placed in his hands. Pelham died on 9th March, and Legge was appointed his political successor on the 6th April following; and during this interval, according to old usage, the Chief Justice of the King's Bench would perform all such judicial and ministerial acts in connexion with the Court of Exchequer as belonged to the office of Chancellor of the Exchequer, and the fact that Lee so acted as Chancellor is duly noted in Beatson's *Political Index*. But, not being capable of sitting in the House of Commons, and not being a member of the Government, he could not discharge the political duties which are the only ones that would occur to the general reader on being informed that a particular person held the seals of the Chancellor of the Exchequer during a certain time. The Great Seal of the Exchequer was in Lee's time probably affixed to all sheriffs' warrants of office, as it is still to those of the Sheriffs of London and Middlesex; but a lesser seal or stamp used formerly to be specially impressed upon all process issuing from the Court of Exchequer. It bore the personal initials of the name of the Chancellor of the Exchequer or Chief Justice for the time being; but latterly, and until its abolition some thirty years since, it bore only the letters "O.E." and so required no alteration on a change of office. Lord Denman was the last Lord Chief Justice who to this extent officiated as Chancellor of the Exchequer. A few other similar matters might be perhaps discovered by those whose special knowledge and pursuits qualify them to do so; but, for all useful and general purposes, the new Catalogue deserves great commendation, and in future editions will unquestionably be rendered even better than it now is. The Catalogue also gives a list of the portraits in the order of their accession to the Gallery, and short biographical notices of the artists with reference to their works in the collection. There is, too, a catalogue of autographs, and it is to be hoped that this part of the treasures under Mr. Scharf's care may continue to be increased by donations, as has hitherto been the case, no public money having been expended on their purchase. Whatever errors may be found in the Catalogue may be attributed to the curmudgeonly jealousy of the Stationery Office, which refuses those ordinary conveniences for correcting proofs which all private publishers afford to non-official compilers. We would point to the notice of one distinguished man, in which, entirely by the fault of the Stationery Office, misdescriptions have been allowed to stand.

Among the acquisitions of the past year may be especially noted an alto-rilievo, in white marble, of Mrs. Siddons, sculptured by Thomas Campbell, an artist of no mean ability. This memorial of the great actress was acquired some time since by Mr. Gibson Craig, of Edinburgh, at the sale of the sculptor's effects, and has been recently presented by him to the Gallery. It is a fine work, and does full justice to its great original. It is known that the intention of placing a monument to Mrs. Siddons in Westminster Abbey was mainly encouraged by her distinguished successor, Mr. Macready; and, indeed, that he personally found the greater part of the funds necessary for carrying it to completion. This piece of sculpture is, therefore, as might be expected, mentioned by Macready in his *Reminiscences*, to which reference is made in the Catalogue. He records that it was prepared by Campbell to be placed in the Abbey; but no reason is given for the preference ultimately accorded to the full-length statue which actually stands there, and which is much inferior to this, both as an adequate likeness and as a work of art. It is well that so worthy a representation of our greatest actress should be placed in the Portrait Gallery, and it is in a position where it can be seen to the greatest advantage.

Among the new pictures now reported on, there is one of much interest, but the subject of which is not yet absolutely known. As described in the Report, it represents Queen Anne presiding at a Court ceremonial in the State apartments on the ground-floor of some palace, in which most of the principal figures are arrayed in the robes of the Order of the Garter. Yeomen of the Guard are in attendance; and in the distance, in an anteroom, or looking in through a window, other persons are represented. The picture is signed by Peter Angelis, who was not in England before 1712, and remained in it to 1724; and as Queen Anne died in 1714, the date of the picture is thus limited to the last two years of her reign. The Queen is laying her right hand upon the joined hands of two of the Knights of the Garter, who are kneeling before her upon the lowest step of the throne. It is not now intended to offer any opinion upon the significance of this part of the picture; but as to the general nature of the occasion a suggestion may be made towards explanation. From the number of persons present in the full robes of the Garter it seems difficult to avoid the inference that a Chapter of the Order is being held, and it remains to discover an incident in the history of the Order in the last two years of the reign of Queen Anne of such interest as to render probable its perpetuation in a special picture by an eminent artist; and this, it is submitted, can be done.

Burnet, in the *History of His Own Times*, and writing of the events in the latter part of the year 1712, says, "At this time the Order of the Garter had nine vacant stalls, so six knights were at one time promoted—the Dukes of Beaufort, Hamilton, and Kent, and the Earls of Oxford, Poulet, and Strafford." Now the Duke of Hamilton was killed in his famous duel with Lord Mohun on the 15th of November, 1712, a few days before he intended to set out on his embassy to the Court of France, to which he had been recently appointed, so that this large addition to the number of Knights of the Garter must have taken place, at any rate, before

the middle of the month of November. But the date is capable of being fixed with absolute precision. For Dean Swift, writing to his friend Dr. King, from London, on October 21, 1712, says:—"The Lord Treasurer (that is, the Earl of Oxford) goes down to Windsor on Friday next to be chosen of the Garter with five more lords." The other new knights were Henry, Duke of Beaufort, Captain of the Band of Gentlemen Pensioners; James, Duke of Hamilton and Brandon, who had been appointed Master-General of the Ordnance on the preceding 29th August; Henry, Duke of Kent; John, Earl of Poulet, Lord Steward of the Household; and Thomas, Earl of Strafford, just made First Lord Commissioner of the Admiralty. There is evidence from the easily accessible accounts of the careers of these noblemen that they were all elected Knights of the Garter on the 26th October, 1712, and Swift's letter fixes Windsor as the place of the ceremony. Some of them might have had to kiss hands on recent appointments to office. Those who lived were afterwards formally installed in St. George's Chapel on the 4th August, 1713. For further assistance in identifying the portraits of the great personages taking part in the function, it may be mentioned that Sir Jonathan Trelawney (one of the Seven Bishops as Bishop of Exeter) was Bishop of Winchester at the time, and Sprat (also Dean of Westminster) was Bishop of Salisbury, and these bishops would be probably present as Chancellor and Prelate respectively of the Order of the Garter.

The Duke of Marlborough left England four days afterwards—namely, on the 30th of October, 1712. But, considering the grave charges then pending against him, it is hardly likely that he should have presented himself at Court. It was at the end of the previous June that Lord Poulet had attacked him in debate in the House of Lords, which led to a hostile message sent by the Duke through Lord Mohun, and that the Queen had interfered and an apparent reconciliation had been effected. There must, however, be in existence authentic records of the Order of the Garter, which would disclose who were the persons present at the Chapter held on the 26th of October, 1712.

An interesting feature in the National Portrait Gallery is the gradually increasing collection of likenesses engraved *ad vivum*—that is to say, taken direct from the life, and not from a previously existing picture. Fourteen of these have been placed on the walls during the past year, and they include among others of note Lord Keeper Guilford, Titus Oates, Bishop Pearson of the Creed, Isaac Watts, and Olarendon. Such names as these well illustrate the rule laid down by the late Earl Stanhope—that no portrait should be admitted as to which a person of good education should have to ask "Who is he?" and it is clear that the value of the collection can only be maintained by a strict exercise of the power to refuse admission to portraits of undistinguished individuals, however much family pride or private feelings might be gratified by yielding to solicitations to purchase or by accepting offers of absolute gifts.

The statement that no less than thirty-eight pictures have within the last twelve months been protected by glass will be received with mingled approval and regret. It is satisfactory to know that due means have been taken to guard our treasures against the mischievous effects of the smoke-laden atmosphere of London; but the continued existence of the still unchecked supremacy of this evil leads to very serious reflections. If it were not for the knowledge that some well-directed efforts are now being made to restore London to a condition in which works of art may be kept in it without risk of destruction, the situation would be a grave one indeed.

Complete protection against the peril of loss by fire of the priceless collection now contained in the National Portrait Gallery can only be afforded by Government measures supported in Parliament. The building is not fireproof; some improvements, it is true, have been made towards averting a possible burning in effigy, pictorial and sculptured, of the departed great ones assembled in our metropolitan Valhalla. Nevertheless, early in the present year the place was actually on fire, and there might have been a holocaust. Fortunately, no serious mischief was done; but another winter should not be allowed to pass without rendering the system employed to heat the galleries free from any risk of a fire, which, if it once got hold of the fabric, would hardly fail to end in a general and disastrous conflagration.

#### SELLA CURULIS.

THERE have been times when it has been hinted that Mr. Gladstone was not very fond of Greenwich—at least as regards whitebait dinners—and there have also been times when it seemed as if Greenwich were not very fond of Mr. Gladstone. Indeed, a superficial historian, judging from the fact that the Prime Minister did not present himself for re-election, and that Greenwich is now represented by two wicked Tories, might be inclined to think that this latter was the present state of the case. He would have been egregiously mistaken. On Wednesday Mr. Gladstone came to dine at Greenwich with *bon* and *arrivabun*, with Secretaries and Under-Secretaries, Presidents and Vice-Presidents, from Lord Granville down to the very latest accession to the Ministry, who has just accepted the minished glories of the Lord-Advocateship. They came, according to custom, by what M. de Flomac called the *peniboot*—that is to say, a specially chartered *peniboot*, of course. This honoured re-

representative of Britannia's mercantile navy was greeted with guns, and probably, though reports are silent on the subject, with "See the conquering hero." It is to be hoped that the guns did not continue during the banquet, because an intermittent cannonade, unless the eater be a King of Denmark and to the manner born, is not conducive to comfortable mastication or digestion. But before the hungry Ministers were allowed to eat their dinner with the pleasant certainty of not being summoned from the dining-room at the bidding of Mr. Biggar, and soundly scolded by Mr. Healy for the unconscionable time bestowed on creature comforts, they had a ceremony to go through. The lively fancy of the Liberals of Greenwich had determined once more to provide Mr. Gladstone with a seat—a literal one this time. None of the dark suspicions which hung about Mr. Slumkey's coal-scuttle have been suggested even by a base Tory press in reference to Mr. Gladstone's armchair. It is a genuine testimonial such as the Premier, who has not his predecessor's brutal indifference to the people's gifts, loves to accept. The armchair of Wednesday will make an important addition to the museum of miscellaneous products which already exists at Hawarden. Oak, silver, and buff morocco support and upholster it. It is the work of Mr. Lucraft (whether the celebrated patriot of that name or some other we know not), and it is covered lavishly with what an Irish deputation which once presented a sword to Marshal MacMahon called "symbols of emblems." There are the arms of the distinguished statesman, there are roses and shamrocks and thistles, there is a dubious bundle of leeks, which may be either intended to symbolize the favourite food of the sinner (ut opinatur doctissimus Scriblerus. Vide infra), or may be meant to refer to Wales. On either side of this collection of vegetables is an axe, the appropriateness of which is obvious and multifarious. Underneath it, we are told, there are on one side the emblems of tyranny, a scourge, a birch rod, and chains; on the other, the emblems of liberty and prosperity, consisting of palm leaves (these, however, are usually considered to symbolize victory, not liberty and prosperity, and doubtless refer to Majuba), and various fruits. Why Mr. Gladstone should be regarded as indifferently devoted to tyranny and liberty it is hard to see; and at first sight it would seem more appropriate to have placed the scourge and the chains on the footstool (for there is a footstool) that the hero might be represented as trampling on the hated objects. But the designers probably knew what they were about, and meant to show that Mr. Gladstone has chains and whips ready for Tories, landlords, Irish churchmen, and other evildoers; while he distributes palms—there is still that difficulty about the palms—and various fruits to good Liberals, Irish mutilators of the tails of cattle (by the way, since the message of peace a pleasing innovation has been introduced, and they now split the tail instead of cutting it off), and other approved and deserving persons.

With the chair there was, of course, a speech; and the speech, according to all rules of exegesis, must be taken in connexion with the chair in which, let us trust, Mr. Gladstone sat to hear it. The speech, however, except in reference to the crux of the palm, has nothing of great interest. It welcomed Mr. Gladstone back to the constituency which has practically turned him out, and told him that the eyes of Greenwich had been on him with increasing admiration. It informed him further (that is, if it is to be taken literally and grammatically) that he had "reflected the greatest glory on himself as a British statesman"—an optical effect which we do not wholly understand. Mr. Gladstone, before his natural astonishment of the feat of autometacatoptrics thus attributed to him had subsided, was instructed that "his desire to stay the progress of war, unrighteously commenced and cruelly prosecuted, has won the admiration of every true philanthropist." Now Mr. Gladstone, as Prime Minister (and the address was limited to his performances in this capacity), has stayed the progress of only one war—that in the Transvaal. As this was wholly commenced and prosecuted under his own Government, it follows that his Greenwich admirers told him that he first unrighteously commenced a war and then cruelly prosecuted it, which is surely one of the most left-handed compliments ever offered to a public man by earnest but maladroit admirers. "When," it seems, "the history" of his Premiership "is read with a vision undimmed by party obscurity and untouched by hostile clamour," a very exalted opinion will be formed of it. The intentions of the Greenwich Liberals are excellent, but their language is a trifle obscure, perhaps owing to a party obscurity. Undimmed by party obscurity may, perhaps, mean unobscured by party blindness. But how about a vision untouched by hostile clamour? "Moi je fais des métaphores qui se suivent," said a great Frenchman. It is to be feared that the Greenwich Liberals cannot truly repeat the boast. Perhaps, however, they only mean that they wish somebody in future times to read a history of Mr. Gladstone's Premiership, which is pure of all attempts to put both sides of the question, and in that case their conclusion will very likely be reached. So much for the address, which, as we have said, is chiefly valuable because of that passage about the Transvaal war, which clearly indicates the otherwise obscure significance of the palm-wreath and is of exegetic value as to the leeks. On the whole, it is to be hoped that a greater knowledge of carpentry has been bestowed on the chair than of English in the speech. Otherwise it is but too likely that the offering will break down and deposit the Prime Minister among the wrecks of the leeks and the palms and the scourges and the other heraldic and symbolic adornments.

The forty-five Secretaries and Under-Secretaries who had no chairs given to them may have been a little bored by this preli-

minary performance, unless they consoled themselves by laughing at the address. If they did this, let us hope it was behind the back of their revered chief, on some of whose own sentences its periods seem to have been modelled, and whose convictions it undoubtedly expressed. Then they went upstairs, and history drops a veil upon them. Indiscreet persons have endeavoured to lift that veil at least in reference to former banquets, and have informed the world that Ministerial high jinks go on at these feasts. *Jocus circumvolat*, says the witness; let us hope, for the sake of propriety, not also *Cupido*. The Foreign Secretary looks towards the Chancellor of the Duchy of Lancaster, who, by the way, was not present on this occasion, and remarks, "Your health and song, sir"; the youngest Minister is put in the chair—not, let us hope, the leek-and-scourge chair. Probably, also, the Irish Secretary takes off the company "quite natural and distinct," and everybody draws bills for fabulous amounts on the back of the menu cards, which the Chancellor of the Exchequer accepts, and the First Lord of the Treasury endorses with the utmost freedom in his double capacity. For this glimpse of the sedate pleasures of a care-burdened Cabinet outsiders are, of course, duly grateful. Fancy, however, is at liberty to paint other and quite different scenes. There is what may be called the lurid picture, the "blue light's derunt," as Mr. Carlyle had it. Mr. Gladstone produces a long list of doomed institutions, and the famous blood bargain of the second triumvirate is repeated. The Lord Advocate sacrifices the Historiographer Royal of Scotland in exchange for a Bill confiscating all the North British property of the Duke of Sutherland. Mr. Courtney promises not to support women's suffrage provided the Boers are allowed to strip any Englishman of his property. Lord Hartington abandons primogeniture, and consents to the introduction of the law of *quodlibet*, on condition that he shall never be asked to be in the House before dinner-time or expected to contribute anything more than common sense to a discussion. There is the business-like picture suggested, indeed, by Mr. Gladstone's reply to the chair-givers, which, like most Ministerial remarks lately, harped upon the changes to be introduced into the business of the House of Commons. A large sheet of foolscap by the side of each Minister, an inkstand among the multitudinous wine-glasses, and a stipulation that each should contribute a suggestion as the successive dishes came round—this, according to the general arrangements of a Greenwich dinner, would make up a Bill about as long as the Land Act—may have been part of the programme of the festive occasion. Or, after all, and most probably, it may have been a very ordinary dinner, like all other dinners; a novelty and, for the time, an excitement to Mr. Asher, Mr. Herbert Gladstone, and other newcomers; an institution kept up for the sake of "auld lang syne" to some, to others simply a bore. If a recent utterance of Mr. Bright's may be taken as indicating the probable state of mind of his colleagues, the feeling of the forty-six must have been secret but unanimous relief. "Thank heaven I shan't see much of you forty-five fellows for a few months." Mr. Gladstone, if he has ever read *Regrets sur ma vieille robe de chambre*, which is doubtful, must have been dreading the probable effect of his new chair on his study; Mr. Forster chewing the cud of the latest flowers of compliment thrown to him by the Irish members; Mr. Chamberlain wondering whether the sailors upon whom he rather cavalierly turned his back on Monday last would way-lay the *pénibout* piratically on its return and suspend him from a yard-arm (only *pénibouts* have no yard-arms). It is rather stale moralizing to say that Atræa Ura perches at the back of a Greenwich diner's chair, and indigestion sits among the flowers and fruits before him. But, at any rate, ordinary diners do not require Inspector Denning to look after them as they seek the festive halls, whatever may be the case on their return. That intelligent officer, what with Mr. Bradlaugh and Mr. O'Donovan Rossa, has had a hard time of it of late, and must be as glad of the end of the Session as Lord Hartington himself. Fortunately, however, *cartouches farcies en dynamite* did not figure on the menu, and everybody seems to have got safe home again—Mr. Gladstone, let us hope, conveying, or having conveyed, the symbolic chair with all its leeks along with him.

#### AGNOSTIC MORALITY.

MISS BEVINGTON has made a fierce attack in the *Fortnightly Review* on Mr. Goldwin Smith, as a typical representative of a certain class of modern thinkers who do not indeed deny "the leading scientific hypothesis of our time"—evolution—but seem to mistrust what she calls "the moral colour of Rationalism." Mr. Goldwin Smith will hardly be regarded as a theological dogmatist, and if he looks with some distrust on "the moral implications" of Agnosticism, he is borne out, as will presently appear, by the testimony of writers as little chargeable with any suspicion of Christian or even theistic leanings as Miss Bevington herself. Into the detailed controversy between them we do not propose to enter here, partly because we are not holding a brief for Mr. Goldwin Smith—who appears in some minor points to have laid himself open to a plausible retort—and partly because it would be impossible without carefully comparing with the context the brief extracts from various papers of his cited by Miss Bevington to say how far she has done justice to his real meaning, about which we are often disposed to feel very doubtful. But the main issue is simple enough, though it is

not clearly stated here. It is whether science, as she understands the term, will supply the place of religion. And it is surely quite possible "to give intellectual assent" to any or every scientific hypothesis which can make good its claim to acceptance without being prepared to grant this further postulate. It is, therefore, both idle and irrelevant to complain that writers like Mr. Goldwin Smith begin by admitting or implying that the voice of science is to be listened to, and then "proceed to dilate on the prospective misery and degeneration such listening will bring upon our ill-fated race." They admit, we presume, what they believe to be scientifically demonstrated, but they do not admit that this scientific creed, however well authenticated, is a sufficient guide of life. It is certainly in this sense, as we gather even from the isolated extracts quoted here, that Mr. Goldwin Smith undertakes "to exhibit the moral shortcomings of scientific philosophy." Nor is there any inconsistency, as his critic assumes, in this line being taken by a writer who admits, if he does admit—on that point no information is before us—the validity of the evolution doctrine as such. We say advisedly the doctrine, as such, because while Miss Bevington says that "the charge brought against scientific doctrine is that it tends to give a charter to personal and political selfishness and tyranny," the first words of her first extract show plainly enough that the charge is brought not against the scientific doctrine but against its exponents, or some of them, who deduce from it certain ethical consequences, as, *e.g.*, that we should dismiss the idea of human brotherhood from our minds, and substitute some new social principle of a very different kind in its place. And these inferences are evidently deduced, not from the scientific truth itself, but from an estimate of its bearings which, as we observed before, makes it the sufficient foundation of all moral and religious truth. It is under this aspect that Mr. Goldwin Smith rejects the account of the moral sense and of moral life given by evolutionists as inadequate, and observes that it recognizes "no essential difference between the philosopher and his dog." Nor is it any reply to his criticism to say that all the long course of physical and resulting moral changes which have intervened in the process from the canine stage to the philosophical is fully admitted by evolutionists, when they treat it—to quote Miss Bevington's own language—as an unbroken "continuity of causation," with no moral or spiritual element, and therefore, of course, excluding, *ex hypothesi*, as she herself points out, the "spiritual life" and "heavenly hope," for which Mr. Goldwin Smith pleads. These changes, as she allows, or rather insists, "have an hereditary rather than an individual history," and offer no record or promise of any moral or spiritual development in the individual members of the race. The "long, complicated, and changeful history" which has made man what he is, has, after all, a physical, not an ethical, character, though it may have induced modifications of mental as well as bodily habit. It is difficult to see how it can afford any ground or motive of "duty," as the writer suggests:—

In point of fact, while sociology offers explanation of the anti-social tendencies still left in individuals, by regarding them as surviving remnants of inherited brutality, it implicitly condemns them by that very explanation as unsuited to the vastly changed external conditions of human existence. Sociologically viewed such tendencies are, among ourselves, unfit. Ethically viewed, therefore, they are hurtful, inhuman, wrong.

"Hurtful" and "inhuman" perhaps, as unsuited to the present stage of human development, but why "wrong," except in the sense, to use an illustration of the writer's own, that "chipped flints" would be wrong "in the hands of a race that has since invented the steam-engine and the telescope"?

We have already intimated that the real gist of Miss Bevington's indictment against those who decline to listen to "the voice of science," as the most credible voice within earshot of this century, is directed against those who refuse to accept scientific teaching as the most credible, or rather the only credible, authority in religious and moral questions. This actual drift of her article becomes clearer as we proceed. The head and front of Mr. Goldwin Smith's offending is summed up in the following extracts:—

After all, without God or spirit, what (he asks) is Humanity? One school of science reckons one hundred and fifty different species of man. What is the bond of unity between these species, and wherein consists the obligation to mutual love and help?

Humanity, it seems to us, is a fundamentally Christian idea. . . . The idea of the progress of Humanity seems to us to have been derived from the Christian belief in the coming of the kingdom of God through the extension of the Church.

To this assertion his assailant indignantly replies that the idea of human brotherhood is "arbitrary" and "rickety," as long as it is upheld on "orthodox" instead of evolutionist grounds. We owe some apology to our readers for putting before them language so offensive to good taste, to say the least, as is contained in the following passage. But it brings out fairly enough the point at issue between Miss Bevington and her opponents, which is not the truth of science, but the moral force of Agnosticism:—

The doctrine that men are "one in Christ" tells merely of the bond of a common faith supposed eventually to be shared by all men alike. All its force hinges on the possession of convictions respecting an after-life—convictions which every advance of real knowledge, whether biological or psychological, tends indirectly rather to weaken than to reinforce. Such a doctrine implies that men's duty of mutual helpfulness is derived from a single teacher's injunctions; and that they are to feel and to act as "brothers," not because of the simple, natural fact that they are knit by their common needs, and mutual powers of helpfulness, but because one large-hearted, heretical Jewish artisan but yesterday was, by a section of humanity, declared a god, or a demi-god; and but yesterday, in that

character, imposed the notion of the unity of humanity, declaring that all the slight varieties of men he knew of should love one another "for his sake." Needless to say that this limited idea of the obligation of "brotherhood" is an idea likely enough to be unseated.

Now we are not going to enter on a general discussion of the relative moral influences of Christianity and Rationalism. As regards the recent instances of an incipient tendency to merciless and unjust dealings noted by Mr. Goldwin Smith, his assailant has no doubt shown, as he had himself expressly acknowledged, that "among the foremost champions of humanity stood some men of the highest eminence who are generally classed with the ultra-scientific school." But even here there is much force in his remark that "they are men in whose philosophy an essentially theological element still lingers, however untheological the language of some of them may be," as the result of previous training and of the religious atmosphere which surrounds them. Is Miss Bevington prepared to contest her opponent's arguments as to the Christian influence of Wilberforce in the suppression of modern slavery, or to deny the conspicuous services of a similar kind to the cause of humanity which Christianity has rendered in times past? If so, she may be left to answer the eloquent and elaborate record of those services supplied by a writer so little infected with any taint of theological prepossession as Mr. Lacky, who, by the way, assigns a prominent place in his catalogue to the new sense of the sanctity of human life and of universal brotherhood created and fostered by "a religion not more remarkable for the beauty of its moral teaching than for the power with which it acted on mankind, and which during the last few centuries has been the source of countless blessings to the world." That "the voice of science" alone will be able to produce or to sustain such beneficent results is at least "not proven"; its moral triumphs are in the future.

We may indeed bring forward against Miss Bevington the testimony of one of her own most distinguished witnesses, who agrees with her that "the old theologues" have had their day, and dismisses Christianity to the limbo of defunct superstitions, while yet he considers it a far less "rickety" and "arbitrary" basis of religious and moral life than what she offers in its place. In a paper noticed in our columns not long ago Mr. Frederic Harrison assures us that "the faith of Christ and Paul and Augustine and Luther would not have done all it has done for eighteen hundred years, if it did not touch the deepest chords of the human heart." Nor does he think its power exhausted yet, for he adds that the religion of Humanity, of which he is the prophet, "has more sympathy with Theism than with Atheism; more respect for the Athanasian Creed itself than for Panteism; and a firm conviction that Christianity, whatever its destiny may be, will long outlive as a religion all forms of cosmic emotion." Every form of Theism, and especially the Christian, really did and does work as a religion, he tells us, though of course he considers them mistaken creeds. But meanwhile he can hardly find words to express his withering contempt for the religious and moral claims of every form of Agnosticism. "They cannot compass duty"—the italics are his own. We are mockingly bidden to preach these Gospels to the fatherless and the widow and the heart-broken; to enforce their moral teachings on the debauchee, the glutton, and the cheat; to try if they will tame the demon of despotic cruelty or heal the social delirium of anarchy. "It would be like offering roses to a famished tiger, or playing a sonata to a man in a fever. . . . You might as well tell a mother to bring up her child on the binomial theorem." And those who put their trust in such scientific creeds are advised "to call to the Unknowable, and ask it to bestow on them a spirit of resignation to the dispensations of infinite differentiation." We could quote plenty more to the same purpose, but this may suffice. Miss Bevington may perhaps reply, with another of her chosen witnesses, Mr. Herbert Spencer, that she has as little respect for Comtism as for Christianity. Be it so. But, while these rival scientists are exhausting the capabilities of the English language to give utterance to the sovereign contempt they respectively feel for each other's theories of moral and religious life, old-fashioned people may perhaps be excused for clinging to the rickety system which has done its work pretty well for eighteen centuries, and is likely, according to one of the ablest of its opponents, long to outlive the scientific substitute proffered for an exploded faith, which "cannot act," and therefore "will never be a religion."

#### A PATTERN SHERIFF.

THE respectable inhabitants of the United States are, to do them justice, fully awake at last to the unpleasantness arising from the fact that all bad Irish Americans, when they become intolerable in their adopted country, go back, or send reminders of their existence back, to England. An American newspaper of standing has made the suggestion, in which it has probably been anticipated by every facetious schoolboy in Great Britain, that dynamite—"holy dynamite"—might be good for Mr. Ross himself. Mr. Blaine has intimated in the most gratifying manner his sympathy with Sir William Harcourt and his extreme desire to find the consignors of the Liverpool infernal machines. All this is very gratifying, but slightly unpractical. The fact unfortunately remains that the United States, by no fault of their own, exercise a remarkable process of exorcismancy or sieve divination

upon the characters of the Irishmen whom they attract to their shores. The respectable emigrant very soon finds his level, settles to work, and though when he is very young and foolish he sometimes subscribes hard-earned dollars for the carrying on of private war against Great Britain, these dollars for the most part find their way into the pockets of the "gorgeous bar-tender," and Great Britain stands very much where it did. The worst sort of Irish American, on the other hand, is rejected by the sieve. Sometimes he finds an unwept grave in the West; sometimes he is passed on to Australia, where he becomes a larrykin or is sacrificed, no one bemoaning him, by larrykins; more frequently, especially in times of agitation, he comes back to his native country, and becomes the pest and curse whom we all know, if only—on this side of St. George's Channel—by report.

This being the case, the deeds of Mr. Patrick Garrett, whom without any very definite evidence we may fairly assume to be of Irish extraction, seem to deserve some comment, if only to show that everything Irish does not deteriorate when it is exported to America. Mr. Garrett is described as the "brave and faithful Pat" Garrett, and he appears to be Sheriff of Lincoln County, New Mexico. Now, in New Mexico there was lately an unfortunate brave known as Billy the Kid. Billy the Kid is dead, and the people of New Mexico do not appear to weep over his urn. Indeed, if we are to believe the *Santa Fé New Mexican*, "no report could have caused a more general feeling of satisfaction than that of the death of Billy," while, when it was known that the auspicious event was due to the hand of Patrick Garrett, "the sense of satisfaction was heightened to one of delight." The meeting of Garrett and the Kid was, indeed, a dramatic one, and it is only to be regretted that a moment of weakness on the Kid's part threw an obvious advantage almost amounting to foul play on the side of the law. The misdeeds of William the Kid had been many, and Sheriff Patrick had long been on his track. "At last," he reports to the Governor of New Mexico, "he heard that William Bonny, alias the Kid, had been in the neighbourhood of Fort Sumner for some time." So the Sheriff took with him two trusty men, who, however, did not figure in the final scene, and went to Fort Sumner. At midnight he entered the Fort and "went to the room of Mr. P. Maxwell," a personage who is introduced somewhat Homerically, and without that precise description which realism demands. Whether Mr. P. Maxwell was an accomplice of the Kid's, or a well-wisher to justice, does not appear, but it seems that the Sheriff thought it not superfluous to explain his own redoubtable presence in the Maxwellian chamber. While he was thus engaged "a man entered the room in stocking feet with a pistol in one hand and a knife in the other." It is impossible to doubt that, if one of Mr. Bret Harte's model characters had been in the Sheriff's place, he would instantly have fired on the man, and have subsequently made all proper inquiries; while in the same way, if he had been in the man's place, he would have adopted the same prudent course of proceeding towards the Sheriff. Even Thompson of Angel's, however, was notoriously disconcerted on a famous occasion, and allowance may therefore be made for Messrs. Garrett and Bonny respectively. The Kid, however, must have been very much demoralized, for, even when Mr. Garrett "reached behind him"—a gesture as significant of shooting in America as of the harmless quest for a pocket-handkerchief in England—he did not fire first, according to the precept for such cases made and provided. He came to the bed, and inquired of the presumably recumbent Maxwell "Who is it?" repeating that question in the second person while he held his pistol at Mr. Garrett's breast. The duty of the gallant Patrick was then a "darned clear thing." He shot the Kid through the heart with the utmost precision, so that, as Dufoe has it, "he never spoke more." The report modestly apologizes for the compulsory summariness of the proceedings; but the Fort Sumner coroner's jury scouted these bashful excuses of Mr. Garrett's. "We, the jury," say they, "unanimously say that William Bonny came to his death from a wound in the breast in the region of the heart, fired from a pistol in the hand of Pat A. Garrett, and our decision is that the action of the said Garrett was justifiable homicide; and we are united in our opinion that the gratitude of all the community is due to the said Garrett, and that he deserves to be compensated." A wound fired from a pistol is an unusual expression, and compensation for indulging in the amusement of shooting seems to be somewhat out of place. The jury, whose names are all Spanish, doubtless meant reward. But there is no necessity to differ with them or with the *Santa Fé New Mexican* in our general estimate of Mr. Pat Garrett. We think, speaking critically, that he should have had his pistol ready sooner, and so have been independent of the fortunate irresolution of the Kid. But, supposing that the Kid had got to be shot—which seems to be a foregone conclusion—it must be admitted that Pat A. Garrett, with the pistol and knife at his own breast, got his ballet-off with great lightness, freedom, courage, and discretion.

It must strike everybody that, as the United States are so lavish to us of Redpaths, Boytous, O'Donovan Rossas, and such like cattle, it is a great pity that they cannot spare us a few Patrick Garretts to counteract the operations of the League, which the *Pall Mall Gazette* pathetically regards as a "law-abiding trade's union," spoilt and warped in its development by the malign influence of coercion. The cheerful support of public opinion, as expressed by juries in Ireland, Mr. Garrett would, indeed, lack if he endeavoured to apply the appropriate remedies to the Irish representatives of Billy the Kid. But public opinion on this side the Channel might be educated to sustain him. It is certainly

worth notice that since the passing of the Land Bill has been a practically assured fact, a distinct recrudescence of outrages has taken place. Midnight maiming and menace, despite the summer nights and the approach of the harvest, have once more come into fashion; outrages on animals of a more brutal kind than ever have recommenced; Boycotting has reached such a pitch that something like four hundred labourers have been sent from Ulster to save the grass on tabooed estates; columns of troops and police are once more required to enforce the ordinary processes of law (processes which will go on exactly in the same way under the Land Act as before it); houses have been burnt; sportsmen have been molested; threatening letters are rife again, and the language of the agitators who are at the bottom of all these things is more confident than ever. The Land Act, it must be remembered, will at first bring about something like a crisis in hundreds and thousands of holdings. Either the holders will have to pay with such discount as the arrears' clause allows them, or they will have to submit to their holdings being sold and the price set against their debts. Either of these processes is absolutely inconsistent with the Land League programme; and, therefore, unless the League collapses entirely, which is for the present improbable, the war is sure to be carried on in the ordinary way. For meeting that way persons of the stamp of Mr. Garrett would be extremely useful. It is difficult to think, without pleasurable sensations, of the surprise which a gang of Land League houghers and ear-clippers would feel if some unlucky farmer whom they invaded in the dead of night were to "reach behind" and shoot with the promptness and straightness of Mr. Garrett. The sheriff of an Irish county has more peaceable, though, under the circumstances, not less troublesome, duties to perform than the New Mexican hero, but as an inspector of Constabulary, or even a resident magistrate, Mr. Garrett would be invaluable. It is true that there is a certain uncivilized savour of private war about his conduct, but then that is the whole point of the present Irish struggle. The Irreconcilables in Parliament "disdain to ask for mercy" for the Kilmainham prisoners, and the Radical newspapers "do not blame them." That is to say, they assume the attitude of belligerents, not criminals. Now belligerents have no claim to warning or caution. They shoot each other where they find each other. That was the principle of the duello between Patrick A. Garrett and William the Kid, which was to all intents and purposes a repetition of the celebrated encounter in which Silas Fixings met his death. Belligerency of this kind, according to the Land League, apparently carries with it the rights appertaining to warfare of the older kind. You shoot and plunder non-combatants, levy contributions upon anybody you please, and generally live at free quarters, with the additional right to torture man and beast. Patrick Garrett, "the mainstay of law and order," "the chief reliance of the people in those dark days," as the enthusiastic editor of the *Santa Fé New Mexican* calls him, seems to be exactly the man for Galway. The Irish members would not like him, no doubt. They would use even worse language about him than they use about Mr. Clifford Lloyd (can anybody, by the way, explain why Irishmen, who, when they are loyal and well behaved, are as well-bred men as any in the world, should, when they are ill behaved and of doubtful loyalty, talk about "Clifford Lloyd," and "Benconfield," and "Salisbury," and in other ways ape the boorishness of Bowery rowdies?); they would worry Mr. Forster's life out about him, and bestow on him all the choice epithets that the dictionary could furnish and the Speaker allow. But, if he continued shooting steadily and with luck equal to that which attended him in his encounter with Billy the Kid, an extraordinary amelioration of the state of Ireland could not but follow at very little cost of blood. It is a mystery, second only to that just stated, and strongly confirmatory of copybook maxims, that Irishmen, who are the bravest of the brave on the field of battle, should be such astounding cowards in crime. So long as they can be ten to one, with every advantage of hedges, and masks, and police daunted by the orders of their superiors, and juries certain to find verdicts of Not Guilty, they will murder and outrage away merrily. But the first whiff of straight shooting makes lambs of them; and, except that Mr. O'Donovan Rossa and his friends promptly turn the gas down in the New York slums and sentence Mr. Gladstone as a murderer, there is no more said. If Mr. Patrick Garrett could be induced to come over for a single year, if only to give the Irish Constabulary some lessons, first in knowing a scoundrel when they see him and then in dealing with that scoundrel, he would be the very best message of peace that could possibly be sent to Ireland.

#### THE POLICE IN 1880.

IF nothing more is wanted from the police than that they should be generally useful to the law-abiding public in small matters and content with their service, Sir E. Henderson's Report on the force for last year is to be regarded as highly satisfactory. The public will readily acknowledge that the members of the corps are generally well behaved, and will learn with satisfaction that as nearly as possible 1,400, out of a total of 10,943 of all ranks, have been specially commended or rewarded for good service. Meanwhile the men themselves show that they are satisfied with their position. The number of resignations has sunk from 376 in 1876 to 154 in 1880 although the strength of the force has increased. The general level of conduct among the men has been steadily rising. Only 140 were

dismissed in 1880, which is the lowest number during the last ten years, and very little over half the number dismissed in 1879. The Director of Criminal Investigations, whose Report immediately follows Sir E. Henderson's, draws an equally attractive picture. He laments, indeed, with all his habitual felicity of style, "that such diversity of classification prevails in the several police forces of the kingdom, between whom honourable emulation may well prevail simultaneously with hearty co-operation." There might be some danger that these words should be taken as a discreet official confession that the greyhounds of the London police and the provincial constabulary do not course the criminal hare with that co-operation which would secure his capture; but Mr. Vincent Howard has guarded against any such interpretation. He dwells on the gratifying cordiality with which the London and the country police support one another, and the excellent results which follow in the capture of offenders. Equally satisfactory are the relations of the police of the Criminal Investigation Department and the general force, which "leave now nothing to be desired. The conduct of the officers has been excellent, and the hearty interest evinced by the superintendents of divisions in all the details of the various duties has produced the result that was anticipated, for 6,072 persons have been arrested by detective officers in 1880, against 4,862 in 1879, being an increase of 1,210; 2,390 inquiries, in which no arrest was required, were also made by the officers of the Criminal Investigation Department, being an excess of 324 over the previous year." Sir E. Henderson is equally emphatic as to the general efficiency of the force. He says, "15,103 apprehensions were effected, being an increase of 1,778, and 8,928 convictions were obtained against 6,961 in 1879, an increase of 1,927 convictions." There are, it is true, some figures of a less agreeable character. "The number of the principal offences was 25,368, against 23,234 in the previous year, an increase of 2,134 offences." But this may be partly due to the increased booty offered to "the dangerous classes." New streets and squares, covering an area of within a few yards of seventy miles, have been added to London within the last year, and consequently, as Sir E. Henderson somewhat tautologically says, "The Metropolis is spreading in all directions." An addition has indeed been made to the force of the police, but that is just enough to keep it abreast of crime. The two rival forces are keeping pace in their growth. The result of the Commissioners' survey of the year's activity is even more encouraging than that. "The total number of the principal indictable offences committed against property" is less than it was in 1879 by "268 serious offences." The general increase is due to minor offences, "and to the fact that all petty articles described by the losers as lost or stolen are now entered as petty larcenies." In short, the Commissioner of Police for the Metropolis, and his Director of Criminal Investigations, are harmoniously of a mind that all is for the best in the best of all possible police forces.

All this has a very satisfactory look, but as it commonly happens, an examination of the appendices does not quite bear out the agreeable statements of the Report. As regards the general contentment of the men with their service, the reports of the District Superintendents do, indeed, bear Sir E. Henderson out. Yet, even in this matter they give proof of a feeling of discontent with some details which the Commissioner has not thought necessary to notice. The men of the second class are said to be ill satisfied with the delay and irregularity shown in giving them their promised increase of pay. The married men of the force consider themselves aggrieved with their lodgings, compared with which the single men's section houses are as "palaces," to adopt the expressive language of Mr. Dunlap, Superintendent of the C Division. But neither of these grievances seems to cause much active discontent, and the force, as a whole, appears to be well satisfied with its position. Whether the public has equal reason to be highly satisfied with the police is another question. We have no wish to dispute the real merits of the force, or underrate the difficulties put in their way in the discharge of their duty by the carelessness of the public they are employed to defend, or still more by the erratic benevolence of the Legislature. Occupiers of houses who leave them empty, or who go to bed with the drawing-room window open, have really very little right to blame the police if they are robbed. Still less sympathy is due to tradesmen who expose goods outside their shop-windows, as if for the express purpose of tempting passers-by of uncertain morals. Both of these forms of almost criminal carelessness appear to be on the increase. Another cause of loud complaint from the Superintendents are the new regulations for the treatment of persons arrested for drunkenness in the streets, and by which the police are required to permit them to depart in peace on their own recognizances as soon as they are sober. As was to be expected, the taking of these recognizances is a pure form—a mere farce. According to Mr. Dunlap, "old tipplers," and others who have reduced themselves to a condition "certainly not calling for the sympathy or consideration of any person," have already learnt the full beauty of the instructions, and are in the habit of using the police stations as places in which to sleep off their drink in safety and comparative luxury. Mr. Dunlap obviously does not understand the benevolent intention of these regulations, or see what an ennobling effect this appeal to the "tipplers' finer feeling will have on him.

But, after making every allowance for the police, there is enough in the returns attached to the present Report to call for a very serious discounting of Sir E. Henderson's optimistic representations.

It is very far from satisfactory to find an increase of 2,134 in the number of principal offences, a rise out of all proportion to the increase of population. What makes the increase particularly significant is that it has mainly taken place in the more serious crimes. In burglary and housebreaking the number of offences is 389 more than it was in 1879. There have been 91 more cases of breaking into shops and 24 more cases of robbery. Cases of horse-stealing have increased from 71 to 107—that is, more than 50 per cent.; and sheep-stealing in nearly the same proportion. The most serious increase of all is in the number of murders, which have risen from 9 in 1879 to 17 in 1880. In view of these figures it is hard for the mere outside public to appreciate Sir E. Henderson's obvious satisfaction in stating that the apprehensions effected have risen by 1,778 and the convictions obtained by 1,967, and on the face of it the decrease of 268 in serious offences against property seems almost incredible. A reference to Appendix No. 14 will explain the apparent contradiction and supply one more instance of the use of long lists of figures to the maker of reports who is master of the art of choosing judicious extracts. The increase both of apprehensions and convictions is found under the heading of such minor offences as "Larcenies from the Person," or by servants, and the smallest kinds of thefts. The decrease in crimes is mostly found under the heading of "Larceny by Servants," which accounts for 120 of them, and "Larceny from the Person," which supplies 97. In neither case is the decrease of a kind which can be attributed to the increased vigilance of the police. Servants are necessarily less under their control than any other class of the population, and if they steal less it is probably because they have grown more honest or are better satisfied with their wages. This is good news for householders; but we must demur to allowing the police to take the credit of it. As for "larcenies from the person," or, in simple unofficial language, pocket-picking, the decrease there may be naturally attributed to the greater care of the public who carry purses and watches. Change of fashion has probably more to do with it than Sir E. Henderson's subordinates. By a judicious use of the terms "principal indictable offences," "principal offences," "serious larcenies," and "serious offences," and by picking the figures for comparison, with judgment a report can be easily made to show increases and decreases in the proper places. An allowance, too, may be readily made for the fact that articles reported lost are entered as petty larcenies. But the disagreeable truth remains that there is an increase in the number of crimes; and, when an examination of the figures shows that the increase is greatest in the most serious, we find some difficulty in giving the complacent reception expected to Sir E. Henderson's easy statement that it is due to minor offences and losses. The mere increase in the number of crimes is sufficient to raise disagreeable doubts as to the efficiency of the police, and an analysis of the returns of convictions is calculated to strengthen them greatly. Sir E. Henderson dismisses the subject with a brief sentence of a most satisfactory appearance. "The percentage of convictions to crime in 1879 was 29·96, and in 1880 35·19." Here is an instance of the uses of a good round sum-total. The increase is wholly in the smaller offences. The 9 murders of 1879 led to 12 apprehensions and 7 convictions, while the 17 murders of 1880 resulted in 20 apprehensions and 7 convictions—the number obtained in 1879 for half the crimes. An exactly similar result is obtained by examining the article of burglary and housebreaking. Here we find that the 903 offences of 1879 led to 211 apprehensions and 162 convictions, while the 1,292 of 1880 led to only 206 apprehensions and 142 convictions. The fall-off is startling, and not the less that it is not from good to bad, but from bad to worse. An examination of the returns of other serious offences, such as "breaking into shops, horsestealing," &c., gives a similar result. In looking at these figures it is impossible not to find an unpleasant significance in Mr. Howard Vincent's complacent reference to the excess in 1880 of 324 inquiries, followed by no arrest, over the number of similar inquiries in 1879. Inquiries followed by no arrest of criminals, most of which mean a defeat of the guardians of the law by its enemies, are becoming a specialty of our Criminal Investigation Department. The conviction produced by reading this report and its instructive appendices is that our police are becoming a well-conducted body of men, who make themselves generally useful to the peaceful portion of the community, and are a terror to little boys and small thieves, but unhappily become daily more incapable of struggling with really formidable criminals. One detail of Sir E. Henderson's Report agreeably illustrates the anxious benevolence of our police administration. Ambulance classes have been established, which the members of the force attend with zeal and profit. This is satisfactory, as the number of persons suffering from accidents and assisted by the police has risen from 1,953 in 1876 to 2,486 in 1880, which figures are somewhat characteristically accompanied by a decrease in the number of convictions obtained for furious driving. It is satisfactory to know that a sudden illness is less likely to result in our being left to die in a police cell as drunk and incapable than it was a few years ago. Yet, after all, the first object of maintaining a police force is to suppress crime, and when we find the most serious offences increasing thirty and fifty per cent., we would sacrifice something even of the ambulance classes to secure a proportionate increase in the apprehensions and convictions.

## THE MANNERS OF THE OMNIBUS.

AS with other things, so with the omnibus; there are not wanting those who lament the decay of ancient manners and customs. In the good old days, they say, when there was no "Daylight Route" underground, and when the only way of getting in and out of town was by omnibus, there existed a certain unwritten code of laws which regulated the bearing and behaviour of "insides" towards one another. These laws all aimed at one object—the promotion of the general comfort. For, as the omnibus was generally full, especially in the morning and evening, it was expected that there should be concessions in the matter of shoulders, unselfishness as to legs, which should be tucked under the seat, and suppression of elbows; also, the days of chivalry not yet being quite dead, it was incumbent on every man under the age of sixty to get out and go on the roof, regardless of east wind or rain, to make room for a lady; children were cheerfully received on strange knees; it was considered effeminate for young men to travel inside; the fatigues of the journey were lightened by friendly conversation; social distinctions, while in the "bus," were ignored; the City merchant of Mark Lane sat down beside the oilman of St. Mary Axe, and the chief clerk of the Audit Office every morning exchanged political views with his hatter. Once arrived at the journey's end, however, rank resumed its rights; outside the omnibus all were strangers, and each went separately to his own place. Then the conductor knew his passengers, and paid them due deference, with the compliments of the season; and men looked forward to meeting each other every day in this casual club, the entrance fee to which was only sixpence all the way. Many a life-long friendship was formed in an omnibus, and cemented by daily talks during long years of driving up and down the road. There is, we believe, a romantic legend of one such friendship attached to the Clapham Road. It relates how two old gentlemen who met each morning in the nine o'clock omnibus, and came home together each evening in that which leaves Gracechurch Street at five, conceived so deep an affection for one another, though they were ignorant each of the other's profession and name, that when one died, the other pined away and presently followed his friend, refusing to be comforted. It is a companion story, a pendant, to Mr. Weller's famous History of the Two Coachmen. Such friendships will be formed no more, because the new railways have destroyed the old gatherings in the omnibus and severed the old ties, while it would be absurd to expect new ones to be formed between Clapham Road and Cannon Street. The nervous rush, the banging of carriage doors, the shriek of the whistle, are a sorry exchange for the leisurely bumping, packed six of a side, over four miles of a roughish road, with companions all known by sight, if not by name, to each other.

Things have, indeed, greatly changed; the conductor has ceased to ask if any gentleman will get outside to oblige a lady—a rigid glare would be the sole response; should there be children, the selfishness of the parent is shown in his determination that they shall occupy the seats for which he pays, instead of the knees of passengers who would thus obtain admission; it is no longer considered effeminate to sit inside, and many young men are not ashamed of being habitual inside passengers. The manners of the Metropolitan have been introduced into the omnibus. Everybody, especially the young man, takes up as much room as he can, spreads himself, disregards the fact that his legs are only entitled to one-twelfth of the gangway, and squares his shoulders, which, in breadth, exceed one-sixth of the length. It is through the malign influence of this young man, too, that the conductor is so loth to stop; the young athlete takes his omnibus flying, and disdains to stop it when he alights; therefore elderly people and women are expected to do the same.

There are, however, some survivals of the old courtliness, so to speak, of omnibus manners. For instance, there is the man who, to quote the old, old jokelet, "omnibus horis sapit"—that is, knows the hours of the omnibus. He sits by the door, makes the driver start when the time is up, constitutes himself the protector of the ladies, tells them their fare, prods the conductor in a sensitive rib when a lady wants to get out, opens a conversation with his neighbours, as one opens a game of chess, by the usual well-known moves, is ready with his little well-thumbed pleasantry for the mother with her babies, and has his opinion on the topic of the day neatly formulated and handy for use. Above all, he maintains the good old fashion of open-handed, if ostentatious, honesty displayed in the return of change. The rule of every well-conducted omnibus is, as everybody knows, that change must be passed up from hand to hand, and that every hand must be open. An "inside" must be not only blameless, but free from suspicion, and by this method there is no possibility of the diminution of change by the way. The custom, which would seem to show a lack of confidence as between man and man, is said to have originated in an omnibus running from the suburb of Camberwell (though some say the Commercial Road) to the City in the early days of omnibuses. It happened one winter evening that the conductor sent up half-a-crown's worth of change—twopence having been deducted—to a lady at the far end. The money was passed on from hand to hand, but, in the end, a poor threepenny piece was all that reached the owner. The thing was hushed up for the credit of the suburb, and, indeed, the national mind was fully occupied at the time with the passing of the Reform Bill; but it was whispered from omnibus to omnibus and from road to road, until, to prevent the recur-

rence of so great a scandal, this method, which still survives, was invented.

The manners of the omnibus vary greatly with the time of the day. In the earliest runs the insides are shopmen, shopgirls, and workgirls. The men talk to each other, not about trade—a subject on which tradesmen are shy among each other—but about politics, on which they hold strong opinions, and are all for sweeping measures. One may reflect, while listening, that these men have had protection found for them without any effort on their part for so long, that they have come to regard law and order as the natural condition of things, so that it seems easy in their eyes to exterminate Communards, crush Socialists, trample out Nihilists, destroy Fenians, and imprison Land Leaguers. Nor does it occur to them that they themselves might have to turn out in order to do battle for the cause of order. The girls, for their part, do not talk to each other; the shopgirls wear kid gloves and are dressed in black; they may thus be distinguished from the workgirls, who are dressed in colours, and do not wear gloves except in cold weather. When they go home there is another difference observable between the shopgirls and the workgirls. For the former are in the evening as in the morning, quiet, calm, and presumably happy in their occupation. But the latter are exasperated; they sit together two by two, and with many an angry sniff, catching of the breath, and sharp snap of the lips, they loudly whisper to each other the story of their wrongs. They tell it dramatically and in the form of dialogue, the point of which is perhaps a little injured by the necessity, lamented by so many novelists, of putting in continually, "sezee," "seshee," and "sezi." How is it that women, who can all narrate their own wrongs with such wonderful dramatic force, have never written a single good play? And, to go back to the workgirls, what kind of occupation can that be, what kind of task-masters can theirs be, when this exasperation is the nightly result? Later on the City men crowd the omnibus; but they talk to each other no more; the old friendliness is gone. It may be remarked as a curious fact that the faces of City men are always gloomy in the morning, as if the prospects of the day were never anything but black. This may be but a temporary cloud due to the depression of the last few years, but the time goes on and the cloud does not seem to lift. The younger men, too, wear a depressed countenance. It is still, we may observe, a tradition with City clerks that their place is outside.

When the City contingent has been carried into town, the slack, but steady, business of the day begins. It is at this time that the observer of manners, especially of female manners, may make observations really scientific. There are few men in the omnibus between eleven and four. Those who are found there are of strange appearance; they are the local tradesmen, the builders, doctors, solicitors of the suburb who have business in town; their affairs are absorbing, and they take no notice whatever of their companions in the omnibus, though these be a bevy of hours going a-shopping. The seats during these hours are chiefly crowded with women—ladies and otherwise. There is the housewife, torn from her domestic duties by some special business which worries her; if you look furtively at her, you will find that her lips are moving; she is silently going through that drama of grievances of which the workgirl has already given us an example. There is the lady who may be called the Smiling Cockatoo, all brown curls, fat cheeks, and velvet hat, who is going to buy things in Regent Street; thirty years ago she was pretty; now, with her inane smile and her readiness to chatter with any one, she shows that she has always been silly. Beside her sit two pretty girls, who are going to buy music; they have black rolls in their hand; now and then they whisper each other, and one feels as if, could one know what they said, one would certainly be happier. There are the two women who sit at the end, and appraise every new comer, obviously reckoning up the cost of her dress piece by piece, and communicating the total to each other by an up-lifting of the eyebrows and a little sniff. Who are they, these women, and where do they come from? Have they husbands? Are there men who can love them? What are they like in the domestic circle, seeing they are so ill-bred, so rude, so incapable of common respect in public? To watch them gives one an uneasy feeling, a suspicion that in our very midst, next door to us, opposite us, in our own street, there dwell barbarians dressed in silk and sealskin, who live on the best, go everywhere, see everything, and have not learned the earliest lessons of civilization taught by *Doux Parler* and *Doux Penser*. There is the poor, pinched woman, not young, or beautiful, who is going to town to look for something. What is it she hopes to get? She may have a manuscript at a publisher's; the reader has probably sent it back with cruel and contemptuous words. She may have a picture, a painted plate, a worked anti-macassar; she may be going in hope of getting pupils; she looks as if fate were against her, and only disappointment would await her. There is the woman who treats the omnibus as if it were a four-wheeled cab, and lugs vast trunks with her, or a basket of washing, or a sack of potatoes. Then there are the women who talk. And really these are the most astonishing people of all. They engage in loud conversation the moment they get in; it is all about themselves, their relatives, and their friends, their likes and their dislikes. They talk with as much abandon as if they were alone in their own rooms; they talk as if the other people were only dummies; they talk as if their own affairs were the only things worthy of occupying the attention of a "being with a soul"; they never cease talking. There is therefore, one remarks, a stratum of society even in London in which everybody's private affairs are the only topic of

conversation. The astounding thing is to mark—most “insides” never listen, or mark, or take the least notice of their neighbours—how they drop into talk about things which are absolutely grotesque in their family character; things *tacenda*, say about Cousin Jane’s baby’s last complaint; things ludicrous, which seem to them serious; things painful; things almost incredible. For example, if one may quote such a thing and expect to be believed, we once in an omnibus met a couple who were thus conversing on family matters. They were apparently brother and sister or cousins, certainly not husband and wife. It was Sunday morning, and they were armed with what sailors call the “tools” for public worship. They sat one each side of the door, and they talked loudly and with great animation. And what they were trying to decide was nothing more or less—it was the sweet spring season—than the delicate question, which member of their interesting family was fonder of asparagus. They played with this remarkable topic, always at the top of their voices, from a hundred points of view; they adorned it with whatever of illustration, fancy, or descriptive faculty was at their command; they maintained the contest with vigour and with spirit; nor was it until they got down, at the doors of their conventicle, that temper began to be manifested. For just then the controversy, which threatened to become bitter, had been narrowed to the rival claims of Uncle Joseph and Aunt Eliza.

#### MR. WHYMPER’S ASCENTS IN THE ANDES.

IN the number of the *Alpine Journal* which has just appeared, Mr. Whympcr continues the narrative of his expeditions among the Andes of Ecuador, and describes his ascent of one great mountain near the Equator, and of another on the Equator. His present contribution, like his previous ones to the same journal, is apparently a transcript from his diary, and it may be presumed that, at some future time, a full account of the whole journey will appear in an amplified form. At present, the narrative certainly does not err on the side of diffuseness. In his journal, Mr. Whympcr is as chary of words as sensible mountaineers are when they are walking uphill. There are no picturesque descriptions, no sketches of native life, no accounts of the talk by the bivouac fire or of the minor incidents of travel. All is so compressed that within the limit of ten short pages Mr. Whympcr is able to tell the story of an expedition into a country unknown to Englishmen, and of the ascent of two mighty peaks.

It must not be supposed, however, that because his record is curt, it is uninteresting. The region which he visited is a most remarkable one; and, if his story has the very unusual fault of being somewhat too brief, it is, nevertheless, well told. In a previous contribution he described how he reached Quito, and in that most disagreeable town found a thoroughly uncomfortable inn. The portion of diary now made public begins with his departure from Quito for the mountains close to the Equator. Regarding the country into which he was at this time about to advance, he was, as he laconically says, “completely in the dark,” and he could obtain no information about “routes, stopping places, or the possibility of procuring food.” The reader of his narrative will probably come to the conclusion that he could obtain no information because there were no routes, no inns, and but very little food. Primitive in the extreme does the district north of Quito appear to be; but it is not altogether wild, and, indeed, one institution which our present Government regards as a vile creation of the law seems to flourish in it. Property in land is recognized, and, indeed, the rights of owners extend beyond the limits of eternal snow. One gentleman, who behaved apparently with the greatest courtesy to Mr. Whympcr, was the owner of a large part of the mountain Cayambe, 19,200 feet high, and of the whole of Sara-urcu, said to be 17,400 feet high. As the only occupants of this mountain are wild beasts who are rarely evicted, and practically enjoy absolute tenant-right, the landlord’s gains can hardly be large, but the mountain is his in fee-simple. Whether Mr. Whympcr was wise in mentioning these rights of property may perhaps be doubted. The Swiss and Savoyards are generally thought to have exhausted every means of extorting money from strangers, but it would be terrible indeed if some land-owners were to come to the conclusion that they had rights above the snow-line. Members of the Alpine Club would have to pay heavy tolls or would find themselves “warned off” the Grand Plateau, the slopes of Monte Rosa, and the shoulder of the Matterhorn. Possibly, however, with well-established routes a dedication to the public might be proved.

At a farm belonging to the mountain owner Mr. Whympcr put up on the second day after leaving Quito. Before reaching this place he had to pass the great *quebrada* or ravine of Guallabamba, of which he gives a drawing. Careful comparison of altitudes showed that it was 3,000 feet deep, but it is in very elevated country and the bottom is considerably higher than the top of the *lliqi*. From the farm which has been mentioned Mr. Whympcr went to a neighbouring village and there made a strange discovery. He found that a sport which was formerly very popular in England, but is now decried and strictly forbidden, is loved beyond aught else in Northern Ecuador. The inhabitants of the village were engaged, he says, in the sport of cock-fighting, and it was difficult to get them to attend to anything else. The principal personage of the village promised aid, but “do what we would,” says Mr. Whympcr, “the conversation

invariably bore round to cock-fighting. Every person,” he adds, “of the least pretension to respectability keeps a score or more of cocks.” The possession of these birds does, in fact, as much for a man in Ecuador as, according to the venerable saying, the possession of a horse and gig does for a man in England. Between people who cared only for cock-fighting and a gentleman whose one object was the ascent of high mountains there could hardly be much sympathy, and Mr. Whympcr returned to the farm, where he received an encouraging message from the owner of Cayambe, and next day he met the owner, who took him to a higher and smaller farm, where he was accommodated with a heap of potatoes for a bed. Next morning he started with Señor Espinosa, the friendly proprietor, and the guides; but, unfortunately, there was too much individual liberty of action amongst the company. Jean Antoine Carrel, stretching ahead of everybody, was lost to sight. Mr. Whympcr started after him, and got separated from the rest of the party, the result being that he found himself at sundown in a pathless valley, and, lying down in a thicket which had been used as a lair by wild cattle, passed an agreeable night in the rain. Shortly after this, however, good fortune came. Mr. Whympcr planted his camp high up on the doomed mountain, and on April 4th he marched triumphantly to the top, where he had the pleasure of peering into the thick mist which seems usually to envelope a high summit in the Andes. Nature gave him a kindly hint, in the shape of a strong wind, not to dawdle at a place where fascinations were so great, and he leisurely descended, charmed, doubtless, with a most enjoyable day, and determined forthwith to attempt another mountain on which equal pleasures might be hoped for. Immediately after his ascent of Cayambe he sent off J. A. Carrel to explore a route to the mysterious Sara-urcu.

This mountain is situated nearly on the Equator; and, according to Mr. Whympcr, scarcely anything is known about it in England. We doubt not that he is right; but it should be observed that this painful ignorance is by no means confined to England, as the Ecuadorians themselves seem to be but very little acquainted with the beauties of Sara-urcu. With the knowledge of it which, at the risk of his life, Mr. Whympcr obtained, an inquiring public will, most likely, have to rest content, as it is very doubtful whether any explorer of the future will care to visit what is perhaps the most detestable mountain in the world. Sara-urcu is surrounded by a great dismal swamp, on which incessant rain appears to fall. The atmosphere is, as might be supposed, slightly malarious; and the probable results of a visit to this pleasant marsh are best shown by a fact which Mr. Whympcr casually mentions. Some of his party, going in advance of the rest to deposit provisions, found a skull, which they brought back to camp. “I know that skull,” said an observant Indian who was with the explorers, “it belonged to a man who went out here searching for quinine bark; there were twenty of them altogether, and four came back. This one went to sleep, and did not wake again.” On the first march towards the mountain, however, things did not seem so unpromising. Carrel told Mr. Whympcr that he had found “a regular palace, planted all round with trees,” and the traveller pressed on, doubtless full of hope, but only to find that the palace was a deserted Indian hut in the midst of a primeval forest. Beyond the primeval forest was an equally primeval bog. Exploring parties sent out by Mr. Whympcr, who was for three days struck down by fever, described the country they had ventured into as a horrible swamp. Itain was falling; there were, they said, no paths, and no chance of finding anything to eat, though there was some chance of being eaten, as tracks of wild beasts were numerous. Not in the least daunted by these accounts, Mr. Whympcr, as soon as he was well enough, marched straight into the swamp. At the point where he had to camp, the nature of the mud, he says, was such that if a man stood still he sank into it up to his knees. His followers constructed a bed for him by “cutting down the reeds, and crossing and recrossing them, piling them up until they no longer sank into the foul slime.” On the next day the explorers made their way with great difficulty through dense masses of huge reed, but succeeded at last in reaching a refuge at some mica slate rocks. As a general rule, mica slate is not a pleasant thing to sleep upon, but doubtless it seemed absolute luxury to the travellers after their night in the slime. Beyond this refuge they had again to make their way through the reeds, but struggling on resolutely they left them behind, and established a camp at a considerable height on the slopes of Sara-urcu; and after two days Mr. Whympcr was so fortunate as to obtain a glimpse of the mountain he had come to ascend. On April 16th the rain lifted towards five in the evening, and the peak was visible. Its bearings were promptly taken with a theodolite, a sketch was made of it, and forthwith, as Mr. Whympcr justly remarks, its doom was sealed. On the 17th he started with his guides, and marched straight up to the top of the mountain. Then, like the King of France, he marched down again, having seen nothing on the way up, and nothing, apparently, on the way down again; but the mountain of the Equator was vanquished, and the traveller and his followers returned without mishap to Cayambe, where the inhabitants rejoiced greatly at seeing them again, having thought, certainly not without reason, that they would never return from the dismal swamp. With his arrival at Cayambe Mr. Whympcr’s narrative for the present ends.

The feeling which it will produce with most readers will, we believe, be one of instinctive admiration, and it would be hard to deny that the instinct is a healthy one. It is, of course easy to

say that no object was served by ascending the Andes; that Mr. Whymper incurred great risk without any adequate reason; that mountaineering is an irrational and senseless pursuit. From one point of view, no doubt, it is; so is it a senseless and irrational thing to attempt to reach the North Pole or to accomplish the North-West passage, but, nevertheless, the many heroic efforts which have been made in the Arctic regions have kindled again and again an enthusiasm which no cold reasoning could abate. Mr. Whymper's explorations in the Andes were due to the spirit of adventure, to the love of overcoming difficulty, of encountering danger, which were formerly amongst the distinctive characteristics of Englishmen. Of late we have greatly declined in this respect. Englishmen fail in the Polar seas and talk a great deal, while men of other countries achieve much and say little; and not in Arctic travel alone are foreigners outstripping us. The exploits of such a man as Mr. Whymper are therefore likely to be doubly grateful to his countrymen. They recall the triumphs of other days, and they show that the old spirit is not yet quite dead. Some kinds of mountaineering are no doubt very silly, and occasionally a reckless disregard of great and obvious danger may lead to a terrible accident, such as has just happened on Monte Rosa; but, however much people may argue against mountain climbing as senseless, warm admiration will be felt for such a daring and indomitable traveller as Mr. Whymper; and in justification of this feeling we cannot do better than quote the eloquent words of Théophile Gautier, given by Mr. Freshfield in the number of the *Alpine Journal* which contains Mr. Whymper's narrative. Said the famous Frenchman, discoursing on Alpine ascents, an entirely novel subject in his hands:—"Quoique la raison y puisse objecter, cette lutte de l'homme avec la montagne est poétique et noble. La foule qui a l'instinct des grandes choses environne ces audacieux de respect et à la descente toujours leur fait une ovation. Ils sont la volonté protestant contre l'obstacle aveugle, et ils plantent sur l'inaccessible le drapeau de l'intelligence humaine."

#### A FORGOTTEN SATIRIST.

THERE is no more characteristic feature in the present time than the studious politeness of its polite literature. Rudeness in print draws down actions for libel, and puts its author out of court with British jurymen and British critics. Written discourtesy has either to go unpublished, or to be content with such desultory and imperfect circulation as can be compassed by the use of post-cards. Under such conditions as these, to read the "Works" of Dr. John Wolcot, otherwise Peter Pindar, Esq., is to have a novel and refreshing experience. They represent what may be called the Beef-and-Carrots or Pewter-and-Stingo style in letters, and exhibit the lusty vulgarity of a certain period in English history, political and social, with a fulness of flavour and a burliness of aspect that are really incomparable. They suggest the dandies who were presently to fill with disdainful abhorrence the elegant soul of Pelham. According to that distinguished creature, these gilded youths were wont to "eat cheese by the hundred-weight," and drink porter by the firkin. They affected a taste for strong waters in their lowest and fieriest forms, and were often quite proficient in the picturesque and horrible variety of English known as "St. Giles's Greek." They practised the noble art of self-defence, and lived much with its professors. They fought cocks, drew badgers, played hazard, and generally "sported their blunt" with great freedom and readiness. They called themselves Corinthians, and walked about in top-boots; and they seem to have had some difficulty in recognizing a jest that was not of uncommon breadth unless it were forced upon their sense of humour by means of italics. The age that fathered such buxom and full-blooded young heroes as these rufflers at the Fives Court and the Westminster Pit was a brutal and an unlettered age; and Wolcot was admirably qualified to make it sport and be its critic-in-ordinary. He was born to write libels and break scurril jests; and, having sown his poetical and romantic wild oats, and produced a tragedy called *The Fall of Portugal*, and a thin volume of amorous elegiacs, both of which are full of unconscious humour, he settled down religiously, if with occasional lapses into pure poetry, to the fulfilment of his destiny. He was a journalist in satire, a Rowlandson turned rhyming pamphleteer; and he wrote from day to day on whatever happened to be uppermost. It was all one to him if his subject were Tom Warton or Tom Paine, the execution of Louis Seize or a *miniserie* of Farmer George's, Judge Buller's wig, or Perdita Robinson's fan. He made capital out of any and every thing; and, though he was in some degree contemporary with Scott and Byron, he was one of the best-read writers of his time.

He may be read without much difficulty even now, above all, if he be read, not in extracts, but as a whole; and it is easy enough to account for his popularity. He was a man of unquestionable parts. His mind was vivacious and acute as well as irreverent and coarse. He was undoubtedly scurrilous; but he had a turn for genuine satire, and was rich in what the author of the *Parnassus of Literature* was good enough to call "a species of humour." His wit was abundant, easy, and active, if it was often brutal and often trivial and cheap. He made as light of good grammar in his writings as of good manners and good taste; but he had a strong sense of form of a certain sort, and was the first English satirist who had initiative enough to discard the

heroic couplet and the Hudibrastic metre alike, and cast about for a manner of his own. He was always apt and voluble in his way, too; he was often forcible and daring; and he was sufficiently intelligent and well-informed to give an opinion on all manner of subjects. He knew enough of painting to prefer the beauties of Turner and Reynolds to the pompous feebleness of West and Louthborough; enough of music to resent the popularity of Handel to the exclusion of Bach and Gluck; enough of literature to despise the childish pedantry of Gough and John Nichols, the solemn dulness of Hannah More and Laureate Pye, the "classic tastelessness" of "glistening Hayley." It is no more wonderful that in his way he should have been an influence and a power than it is doubtful that, *mutatis mutandis*, a latter-day Wolcot would, in proportion, achieve almost as much success as the great original. It is not easy, under the changed conditions that are ours, to give an exact idea of the nature and quality of that success; but it seems certain that to the public of a hundred years since Wolcot was not only admired for his satirical power, but also regarded with great respect as a master of pure literature. He was, as Hazlitt wrote of him, "the bard in whom the nation and the king delighted." Not only did his squibs run through edition after edition while their interest was green and new; there was also a steady and a wide demand for his "Complete Works"—which included, not satires only, but a vast number of "odes," "elegies," songs, epigrams, ballads, and pastorals to boot—and of editions of them there are many. Children were reared "on Peter Pindar and the Bible," as in Scotland on the "Bible and Burns." The publisher of certain volumes of selections from the English poets, in which Wolcot was interested, after opining that the Doctor's "sportive use" of Pindar's name had probably "conferred a celebrity" upon it "far higher and more extensive than was given to it by the ancient bard of Thebes," remarks that his "own works display in almost every species of pure poetry examples of singular excellence," and that he "has left hardly one poetical phrase in the whole compass of English speech and composition that he has not transferred to his works"; and to the majority of his readers the claim could hardly have seemed extravagant. It must be owned that nowadays it is not easy to speak seriously of his serious verse, which is limp and dull and frigid even to absurdity. Oftentimes he is most amusing where he would be most impressive. It is odd, for instance, to hear the redoubtable railer indulging in statements like these:—

To hear mute Silence hushed the darkening vale,  
The shaded warbler dropped her plaintive tune,  
Intent, the pale-eyed ghost forgot to wail,  
And stars dependence on the wandering moon;

or exclaiming that "The band of white-robed virgins let him join"; or endeavouring to persuade his mistress that her "deluding art"—the "lovely virgin" that she is—has "lodged a thousand scorpions in his heart." These extracts, it is true, are from the *Persian Love Elegies*, which were printed at Kingston, Jamaica, in 1773, and may be said to be in Peter's early manner; but, for all that, they are sufficiently representative. Too often does the Doctor's muse descend in strains that remind us of those in which the accomplished Lady Lyndon addressed her artless Barry:—

When Sol bedecks the mead with light  
And pallid Cynthia sheds her ray,

and so forth. It is a different matter with his rhymes when their intention is avowedly comic. No doubt his laugh is often a horse-laugh and his fun mere intellectual horseplay; but they were good round knocks that he gave, and when he was happy in his subject—when he was talking of Sir Joseph Banks upon lobsters or of George III. upon apple-dumplings—he amused his audience tremendously. He wrote loosely and carelessly, and his rallery is not less incorrect in form than it is abundant in quantity, so that to "our Neo-Alexandrian taste," as it has been called, he is seldom interesting or admirable. Now and then he hits on an excellent line. His "'No!" cried the staring monarch with a grin," is a little Gillray in words. But, as a rule, Wolcot is only humorous in the mass; as in the six books of *The Lousiad*, in the story of the pilgrim who "took the liberty to boil his peas"; in the sketch of the king at Whitbread's Brewery, which must be read, not for single verses and short passages, but as satiric wholes—just as one watches a "rally" in a pantomime, which, taken by instalments, a slap or a tumble at a time, seems witless enough, but which has only to be properly seen to be very funny indeed. To Wolcot's public no revelation had been vouchsafed of the mystery of sweetness and light; it knew not of verbal niceties nor exquisite workmanship, nor the delicacies and refinements of hostility; it was a heavy-feeding, hard-drinking, and hard-hitting public, ignorant alike of culture and of what Mr. Meredith calls the Fine Shades. And it enjoyed its Pindar mightily; it regarded him as its sworn champion, and cheered his swashing blow to the echo.

Of course the medal had its reverse. Wolcot appears to have been a man of tolerably easy virtue. Among his opponents he bore a very scandalous reputation; and he was not less bitterly hated and furiously abused on the one hand than he was widely read and heartily applauded on the other. Richard Polwhele (addressing him, first of all, as "Offspring of Momus") affirmed that "jaundiced Spleen" had borne him "Under the Manchineel's empoisoned bloom." He was variously saluted in plain prose as an "arrogant upstart," a "foul-mouthed rhymester," and a "fiend in human shape." To the gay young men of the *Anti-Jacobin* he

was indifferently a "monster," a "wholesale dealer in doggerel," the "rude assailant of his country," the "profligate reviler of his sovereign," the "impious blasphemer of his God." Gifford, the asp, Gifford, as Mr. Swinburne dubs him; it is odd that the term seems to come from a passage of Macaulay in which Wolcot is nearly as hardly used—his temper stung to more than ordinary virulence, called Tisiphone his "sister-fiend," and railed at him as "fit garbage for the hell-hound Infamy," a "beastly profaner," a "brutal sot," a "wrinkled profligate," a "reptile," a "prodigy of drunkenness and lust," and so forth. "Come, then," wrote this master of violent English,

Come, then, all filth and venom as thou art,  
Rage in thine eye and rancour in thine heart,  
Come with thy boasted arms, spite, malice, lies,  
Smut, scandal, execrations, blasphemies;

and he went on to assure his readers that Wolcot must have been a ruffian from his infancy downwards, inasmuch as it was a well-known fact that "mangled insects" used to "strew his cradle o'er," while "limbs of birds stained his bib with gore"; with many more felicities of sentiment and imagination of a kindred order. In justice to the object of these amenities, it is to be noted that he has over his opposites the advantage of being humanely inclined and of showing a great deal of good humour. There is something about him that is very genial and very English. He comes forth and vociferates with the frank and jovial impudence of a brilliant bargee or an eloquent hackney coachman; he takes his drubbings in good part, and is equally ready to fight the quarrel over again and to shake hands on it and open upon some one else. His weapon is merely the national "bunch of fives," and he uses it with all the heartiness and good temper, and somewhat in the spirit, of one of the heroes of the ropes and stakes. He is, indeed, the Tom Cribb of English satire; just as Dryden is its Marlborough.

#### THE GREAT DISCOVERY IN EGYPT.

IT would not be easy to exaggerate the importance of the discovery, announced a fortnight ago, of thirty royal mummies in the "Gate of the Kings," near Thebes. Some details have since been published in the daily papers, and it is now possible to judge what revelations in Egyptian history are about to be made. Unfortunately, the apathy which is shown to all things Egyptian by English scholars, and the rarity among us of people able to read hieroglyphics, will throw upon other countries the duty and honour of making known to the world the historical facts which these newly found remains may be expected to give us. Our over-worked officials at the British Museum are taken up with "Assyriology" rather than "Egyptology," these departments of knowledge being united, to the great detriment of both, in the only national institution in which such subjects are studied. Our Universities are content to leave such uninteresting and unimportant branches of learning to self-taught men, whose time should be devoted to arrangement rather than reading. The Egyptian collections in the British Museum are but half catalogued, and cannot be said to have any intelligible arrangement. The recent move to the old geological galleries has not led to any improvement in a condition of things to which we have already more than once called attention. But no improvement can be expected until the double labour indicated above is removed from the shoulders of the officials. It is unreasonable to expect of Dr. Birch and his very few assistants that they should at once perform the work of a University and of a Museum, and that, too, in subjects so widely apart and in themselves so recondite. To expect the same man to be equally well acquainted with cuneiform inscriptions, Egyptian art, early metal-work, and the detection of forged carvings, to say nothing of a general knowledge of the Coptic, Hittite, Accadian, and Hebrew languages and their cognates is manifestly absurd. We expect the guardians of our public collections to do not only the practical and partially mechanical work of their departments, but also to fulfil the duties of professors in a kind of unchartered university. It would not be easy to point to many of the learned teachers of our great academical bodies who have done work so generally interesting and important as that performed by the comparatively unlearned officials of our museums. A single name will serve to illustrate this point. We purposely avoid mention of living scholars in this direction; but the example of the late Mr. George Smith is only one among many which could be adduced to prove that it is not to the Universities that we must look for original research and useful as opposed to merely ornamental learning. There are, however, certain indications that one of the Universities, at least, in the person of an eminent Professor, is about to show some interest in Egypt, though few of us will, in all probability, live to see Chairs founded in England, as in all Continental countries, for the study of the arts and learning of the cradle of civilization.

Rumours have been current for some years as to the existence of a vast storehouse of antiquities amongst the rocks and caves of the Theban Mountains. Every one who has ascended the Nile as far as Luxor will remember the long narrow defile at the end of which the tombs of the kings are situated. Most people who have threaded the Bab el Malook will remember how short the distance seemed between its innermost recess and the Deir el Bahari on the other side of the mountain and facing towards the open plain. We climb over the summit of a narrow ridge, and have on our left

the Valley of the Shadow of Death, with its growing tombs, and on our right, almost under our feet, the rock-cut temple of Queen Hatsheeso. It has long been suspected that within this ridge there was probably some great excavation—say, among the travellers' tales of the last few years were to be heard stories of an untold treasure which might be revealed to any eye who was armed first with a firmman permitting him to search and with a very heavy sum for *bachsheesh* in addition. It may be asked why, if this cavern was known to exist, the natives did not penetrate to it and bring forth something more valuable than the few strings of beads and such-like objects which have been offered to travellers for sale; but it must be remembered both that the Arab is extremely superstitious, and also that, even if he dared to penetrate into a cavern so full of *afreet*s as this must have been, his mechanical appliances for removing great weights from a gallery two hundred feet long, and a secret passage leading to a pit thirty-five feet deep, would be utterly insufficient. Nevertheless, some one bolder than the rest seems last June to have made the venture. By this time the hordes of tourists had ceased to infest the Nile valley. The discovery was made too late for much profit to be got out of it; and Daoud Pasha, the Governor of the district, had his attention called to the abundance and cheapness of the objects with which the *antika* market was suddenly flooded. On inquiry the pit was pointed out to him; and, with commendable promptitude, he telegraphed for Herr Emil Brugsch, the assistant curator of the Boulaq Museum. Every Egyptologist must envy Herr Brugsch for the good fortune which awaited him when he arrived in the Bab el Malook. The thirty mummies which he found were, as he could read at a glance, although he must have felt it difficult to believe his eyes, those of all the most illustrious monarchs of the most glorious epoch of Egyptian history. There lay, side by side, Queen Hatsheeso, King Thothmes III., and King Rameses II., the great Sesostris himself. Of kings of minor note were nearly all those of the Eighteenth Dynasty, together with the father and grandfather of Rameses, and his daughter, whose name, Mautnejem, is new to us. But here the reports may be in error, and the name be an unusual form of Maut-notem, the grandmother of Pinotem. The earliest mummy found is that of Raakenen, a king of that obscure dynasty which preceded the Eighteenth, and which is sometimes reckoned as the Thirteenth and sometimes as the Seventeenth. The latest body is that of Pinotem, the third king of the Twenty-first Dynasty, who reigned as nearly as possible a millennium B.C. In addition to the royal mummies, a multitude of objects bearing cartouches will throw great light upon the succession of these kings; and the tent of Pinotem, of leather, embroidered and coloured, and covered with hieroglyphics, cannot fail to clear up some historical difficulties as to the priest-kings of Thebes. It has been suggested that the mummy reported to be that of Thothmes III. is in reality that of the son of Pinotem, whose name, Ramen Keper, is the throne name or title of the great Eighteenth Dynasty monarch; but until all the inscriptions are read this must remain matter of doubt.

The significance of this remarkable discovery will be of a double character. We shall perhaps have our knowledge of a brilliant period greatly increased by the direct evidence of inscriptions and papyrus rolls. Moreover, there may be found some record of the circumstances which led to the concealment in one place of so many of the illustrious dead whose tombs had already been prepared for them in the Valley of the Kings. The coffin, for example, of King Seti I. is, as everybody knows, in the Sloane Museum, his tomb having been opened and explored by Belzoni. But his mummy is among those which Herr Brugsch has taken to Boulaq. Of nearly all the other kings the sepulchres are also well known. How come they, then, to have been placed in this cavern? It is evident that it must have been soon after the close of the reign of Pinotem, and it is more than probable that some great and terrible disaster was impending when the priests of each deceased king—for every king was reckoned as a god—hurriedly took the precious bodies from their graves, where they lay too much exposed, and placed them in the secret cavern where they have now been found. If we consult Dr. Brugsch and Canon Rawlinson as to the history of the time of Pinotem, we find a serious discrepancy between the two latest authorities. Dr. Brugsch's view seems to accord best with the circumstances revealed by his brother's discovery. He describes a great Assyrian attack upon Egypt which Canon Rawlinson cannot accept. Such an attack, coupled with the fact that we find Pinotem's successor on the throne soon after its supposed occurrence, might account for the concealment of these, the most precious of the royal remains of old Egypt. Reverting to the name of Raakenen, it cannot be but that the discovery of his body will throw some light upon that most interesting, but most obscure, period when the petty kings of the South commenced their struggles with the shepherd kings of the North, and when the first of a line of Pharaohs who knew not Joseph arose to drive out the foreigners. Perhaps we may even recover the full text of that precious fragment of papyrus which describes the beginning of the war between Raakenen of Thebes and Apophis the Hyksos king. We must not, however, be too sanguine as to the contents of the newly discovered rolls, as it is probable that they are all funeral, as no others were ordinarily buried with mummies. Still, a storehouse which contained a tent may well have contained some portions of a library—apart from mere "Books of the Dead." The reign of Queen Hatsheeso will receive fresh attention; and the recovery of her body—if indeed it is her body, and not that of one of the numerous princesses of her line who bore the same name—may enable us to form some conclusion as to the events

which placed her brother Thothmes III. upon the throne. In short, there is hardly any question respecting the great middle period of Egyptian history, including the Captivity and the Exodus of the Israelites, which may not receive its answer through this amazing discovery. It is, indeed, sad to think that we have in England no school of young hieroglyphical students whom we might send out to take part in the long and anxious labours of decipherment. There is much yet to be done in the translation and publication of the earlier records. The number of words of the Pyramid period still remaining unread is very great. But every discovery like the present increases our vocabulary; and though, so far, our adoption of an absurd system of transliteration, borrowed from the French, stands in the way, we must hope that before long English teachers may be found who can train a competent class of students in what is the most fascinating of all Oriental languages, and in some respects the easiest.

#### TRADE PROSPECTS.

SINCE we last wrote trade continues to improve slowly but steadily, so slowly, indeed, that not a few persons doubt the improvement; but the evidences establishing it are clear. In the first place, the Board of Trade Returns show for the first seven months of the current year an increase in the value of the exports of about 1½ per cent. over those of the corresponding period of last year. It is to be borne in mind that last year the exports were greatly swollen by the extraordinary and temporary demand for steel and iron from the United States. That demand came so suddenly and was so large that it nearly doubled the price of iron, and consequently swelled disproportionately the value of the exports in the early months of last year. The demand fell away and with it prices, but still the value of the exports taken altogether this year exceed, as we have said, those of last year. It is plain, therefore, since the exports of steel and iron are so much less that the exports of other commodities must be very much larger. Another point not to be lost sight of is that prices generally have continued to fall since last year. The value, therefore, is not a fair measure of the exports. If we were to take quantities, we should see that the growth of the trade is very much larger than the increased value indicates. It is impossible, however, here to take the quantities. We could only do so by giving a list of all the several articles exported, and showing their quantities, which would occupy too much space and be too wearisome to our readers. Besides, it could not be done completely, for the quantities of many articles are not given at all. It may, however, be taken as certain that where the quantities are given the increase in quantities is larger than the increase in values. It follows, therefore, that the trade continues steadily to grow. It may be thought that the profits of trade are not so great; but this does not necessarily follow. The profits consist of the difference between the cost of an article to the exporter, and the price he receives for it; and, if the cost is low, he clearly is able to sell the article cheaply and yet to receive as large a profit upon his outlay as he would receive were the cost and the price considerably higher. Nor does it follow that the country generally suffers because of the low prices. It may be thought that when iron is sold at its present low price the country receives less for one of the elements of its wealth and prosperity than it would do if prices were at the level of the early part of last year; but that, again, does not follow. It is not the mere money price which is received for an article that measures the advantage to the country, but the amount of other goods which can be obtained by that price; and, if those other goods generally are relatively as cheap as iron is, the country does not suffer by selling at the low price. In fact, it is quite conceivable that the country may be receiving as large a return for its iron at present as it received in the inflation years 1872 and 1873, although prices then were so much higher than they are now, because the prices of all other commodities were equally high. To take another instance, if cotton imported from America or India, or wool imported from Australia, or silk from China or Japan, is relatively as cheap as the prices we receive for those articles when manufactured, the profit not only to the manufacturer but to the country generally must be highly remunerative. Low prices, therefore, are not necessarily unprofitable. They may or they may not be so; but they are not necessarily so, and we believe that, as a matter of fact, there is at present a fair profit upon the trade which the country is doing. Prices generally are low; both the prices which we pay for foreign goods and the prices which we receive from foreigners for our own goods, and, therefore, we believe the margin for profit to be fair.

Further evidence of the improvement in trade is afforded by the reports of the metropolitan banks. We find that of these, four have declared larger dividends than at this time last year, while all the others maintain the same dividends. Again, we find that the deposits had increased in the twelve months over 10 millions sterling, and that the loans and discounts increased over 20 millions sterling. It is quite clear from all this, both that the banks have done very profitable business during the past half-year, and that trade generally is more active than it was in the first half of 1880. That the banks have done a more profitable business follows from the fact that four of them have, as we have said, distributed larger dividends than they did twelve months ago, although some of these

had increased their capitals in the meantime, and, therefore, had to earn a larger sum to pay even the same dividends. And that trade is more active follows from the fact that both the deposits and the loans and discounts have increased so largely. The increase in the deposits is evidence of savings. We do not, of course, mean to say that the whole increase represents savings; for when a bill is discounted or a loan advanced by a bank, the proceeds are entered to the account of the person for whom the bill is discounted, or who borrows the money, and takes the place of a deposit. But to a considerable extent the increase in the deposits does represent actual savings, and, therefore, bears out what we have just said respecting the fair profits earned upon the business done. Against the evidence afforded by the increase in the loans and discounts of the greater activity of trade it has been urged that the loans are made chiefly to the Stock Exchange. But, even if this were true, it would not much affect the position. We do not believe that it is true to the extent commonly asserted, for we make no doubt that a fair proportion of the loans and discounts were on account of legitimate trade. But, even if it were true to this extent, it is to be borne in mind that speculation is not altogether wild gambling. Solvent and well-managed banks do not lend money upon securities which are absolutely worthless; the securities are such as a careful bank manager believes to be worth the money, and a speculation in good securities of this class means that the securities are likely to earn larger dividends than they have been earning, and, consequently, are worth higher prices. In other words, it means that the industrial undertakings of the country, in the opinion of prudent people like careful bank managers, are earning more than they did some time ago, and are likely to continue to earn more. Granting, therefore, that speculation is wild and pushed too far, and that it is a dangerous kind of business to engage in, it still affords evidence that trade has improved and is improving. Still further evidence to the same effect is afforded by the railway reports. Although the railway dividends in general have been disappointing, the reports prove that trade is steadily improving. Take, for example, that of the London and North-Western Railway Company. This great railway serves the most important manufacturing and industrial districts of the United Kingdom, and therefore affords the best index as to the condition of the country. Now the report of the directors tells us that, owing to the exceptionally severe weather in the early part of the year, to the strike among the colliers in the Lancashire district, and to the falling off in the trade with Ireland, at one time the diminution in the receipts, as compared with the corresponding period of last year, was as much as 94,000*l.*; yet at the end of the half-year the receipts exceeded those of the first half of last year by 47,000*l.* In other words, so great has been the improvement in trade during the second three months of the first half of the year that, not only has the decrease in the receipts just mentioned been made up, but 47,000*l.* more has been earned; or during this three months 141,000*l.* more than in the corresponding three months of 1880 were earned by this line. A more striking proof could hardly be afforded of the marked change in the economic condition of the country that has occurred since the beginning of April. And that this marked improvement has taken place in the second half of the six months is of special importance. It shows that trade had then begun to improve, and went on improving to the end of June. That it has since continued to improve is clearly proved by the railway traffic returns. Thus, for the six weeks ending August 6 we find the increase in the receipts compared with the corresponding period of last year on seventeen principal railways of the United Kingdom, exceed a quarter of a million sterling, of which 153,000*l.* was derived from goods. The increase in earnings in the corresponding period of last year over 1879 was very large, and here we see again very considerable increase upon 1880. The greater part of it, too, being from the carriage of goods, it follows, as we have said, that the improvement in trade which began with April has gone on steadily augmenting ever since, and is assuming larger proportions at present. There is no better evidence than the earnings of the railways of the condition of trade, for unless there was a demand for goods, they would not be moved about from one part of the country to another at considerable cost. This increase in the receipts from goods traffic is proof, therefore, that the volume of business being done is very large and is steadily augmenting.

One further piece of evidence of the improvement is afforded by the returns of the Bankers' Clearing House. For the eight weeks ended last Saturday there has been a decrease in the cheques and bills passed through the Clearing House only in a single week, while in the other seven weeks the increase has amounted to nearly 123½ millions sterling and for the eight weeks the net increase is fully 100 millions. Making what allowance we may for the part played in this increase by speculation, it is evident that the volume of business being done must be enormously large to account for such an immense increase in the short space of eight weeks. We might go on adding other proofs of our position from the Revenue receipts, trade reports and circulars, and other sources; but we have said enough to show that the growth of trade is steady and large, and that it is acquiring greater momentum as the year progresses. It is stimulated by the very low prices of all articles at present. It is a common experience that low prices stimulate consumption, and it is quite clear that consumption is at present being stimulated very greatly; more especially it is being stimulated at home. The home consumption would seem, from all the evidences before us, to be growing more

rapidly than even the foreign demand, although the foreign demand also is increasing, and, what is worth noting here, the foreign demand for iron and steel is decidedly increasing. For the first time for a great many months there has been an increase in the exports of iron and steel last July as compared with the preceding July, and all the trade reports and circulars are to the effect that the trade being done at present in manufactured iron is very large, and points to a rise before long in prices. In pig iron there is not the same evidence of improvement. The production is still larger than the consumption, though the production is not so much larger but that a very little increase in the consumption would absorb it, and would lead to a rise in prices. But in all branches of the finished iron trade there is a very large and steadily increasing business being done. If the harvest proves as good as is now expected; if the weather continues favourable, so that the corn is got in safely and in good condition; and if the minor crops also are fairly satisfactory, we may expect a very great improvement in trade before the end of the year. The agricultural depression has weighed upon the country for the last two years, and has prevented the revival in trade which began in September 1879 from proceeding as rapidly as was expected. If now the farmers were to find themselves in a better position, the effect would be magical. No doubt the present harvest is not good enough to compensate farmers for all their previous losses. The summary of the agricultural returns published this week shows that there is a falling off in the area under wheat, barley, and peas, and that there is also a decrease in cattle, sheep, and lambs. It is not possible, therefore, that the present harvest can recoup the farmers. It is further to be remembered that in many parts wheat is thin, the straw is short, and though the ear is good, and may be saved in good condition, yet there is much still to be desired for the farmers' sake. But undoubtedly the harvest is very much better than those of recent years. It will put the farmer in better courage, and will repair his credit with the country banks, the country banks themselves will recover courage, and altogether the effect upon the agricultural classes will be most beneficial. If so, the improvement in trade may be expected to be marked and rapid in the coming autumn. Very dear money, indeed, may check the improvement; but, for the reasons we have stated on various occasions lately, we do not expect very dear money. No doubt money will be higher in value than it has been for some years back, but it will not be so dear, we think, as to interfere with trade.

## REVIEWS.

### MR. SYMONDS'S LITERATURE OF THE RENAISSANCE.\*

THESE two volumes complete the work of Mr. Symonds on the Italian Renaissance. In the *Age of the Despots* he discussed the political, in the *Revival of Learning* the scholastic, and in the *Fine Arts* the artistic life of the period. To each of the earlier treatises one volume only was devoted. The literature of the age, in which the character and spirit of the people find their fullest and most varied expression, is discussed more exhaustively. The two volumes give the completest account of the subject yet published in English; and they include, besides what belongs strictly to the period of the Renaissance, introductory chapters of great interest, tracing the earlier growth of the Italian language and literature. Of the whole series they form probably the most practically useful part, and give, in a condensed and attractive form, information which has been gathered from the most multifarious sources, and, what is of great value, the latest results of native Italian criticism and research. The general principles according to which the Renaissance is to be judged and investigated are so clearly fixed that it would be no compliment to the soundness of an author's judgment to say that he had offered an original view of the period; but whatever a wide and intimate acquaintance both with the literature itself and with the labours of other scholars in the same field can produce is here offered to the English reader. Like all that Mr. Symonds writes, these volumes are remarkably pleasant reading; and though there are in them some linguistic singularities, to which we shall presently call attention, the exuberance of style which characterizes some of his earlier writings has here been considerably, and with great advantage, tempered and chastened. It may be added that the practical usefulness of the work has been increased by a copious index to these and the preceding volumes.

The first chapter traces the earlier and less known influences which shaped the beginnings of Italian literature, and, in particular, the influence of French poetry and legends, and of the cosmopolitan Court of the Emperor Frederick II. in Sicily. The persistence throughout the greater part of the Peninsula, as compared with other parts of the Roman Empire, of the old civilization, and the absence of feudalism and of an overpowering aristocratic caste, furnished to Italian literature a ground at once popular and historic to start from; and foreign ideas and examples served only, at this earlier period, to suggest the first steps to the native Italian genius. In Dante, Petrarch, and Boccaccio—the triumvirate of

the period which followed—this genius appears in its full originality, strength, and independence, borrowing from sources outside itself no more than is inevitable with all literature, and stamping whatever it borrows with its own spirit and character. The lifetime of the three leaders of Italian literature marks the first period treated by Mr. Symonds. The next is the period of the scholars, in which the re-discovery of classical, and particularly of Latin, models suspended for a time the cultivation of a native literature. But here it is to be remarked that it was by no means a foreign influence which led the men of that period to ignore or despise the capacities of their own language. In preferring Latin to Italian they were only conscious of preferring a past rich in a great literature, and associated with great historical memories, to a present which, because seen without illusion, is always apt to be unfairly disregarded. It must further be borne in mind that humanism furnished a common ground on which men from all parts of Italy could meet, and embraced numbers of persons to whom the Tuscan language and spirit were, if not foreign, still about as much so as the newly-found classical literature which was drawing all Italy after it. Further, the influence of a new spirit, different from all that the men of that age had hitherto known, opening fresh avenues of thought and action, and tending to emancipate men from the thralldom of a Church which the Italians have always seen at its worst, so engaged the interest and enthusiasm of the intelligent classes that, even had they been able to do their own literature justice, they could not but have neglected it for a season to enjoy the new world which was disclosed to them. After a while, however, when classical literature became familiar to them, and had lost the charm of surprise, the balance was redressed, and the language of the people was once more brought back to honour. The second, or humanistic period, with its exclusive devotion to classical models, thus led the way to the third period, in which the Italian genius, trained and developed afresh by long and intimate study of the models of antiquity, turned again to native sources. The greatest name of this third period, which dates from the latter part of the fifteenth century to the Counter-Reformation, is that of Ariosto.

The subjects discussed in these volumes are so manifold that it is impossible within the limits assigned to us to do more than touch briefly on a very few of them. They appear to us to be treated, for the most part, with excellent judgment. In particular we would call attention to the admirable chapter on the *Orlando Furioso* and the no less interesting chapter on Pietro Aretino. With nearly all that is said on the subject of Ariosto's great poem we can fully concur, or, at all events, with nearly all that is said on the subject of Ariosto himself. We should be inclined, however, to mark more strongly the contrast between the genius of Ariosto and the effect which the *Orlando* produces on the reader. From gifts like those of Ariosto, from his wonderful breadth and power, from his admirable sense of style, from his perfect mastery of the material he handles, something more might be demanded than what he actually gives us. This sense of inadequacy between the poem and the poet strikes us when we read the *Orlando Furioso* consecutively and as a whole. When we dip into it, when we read it occasionally, canto by canto, few poems can be more charming or impress us with a stronger sense of the high gifts of the writer. But when we sit down to read it through, and at the end try to give ourselves an account of the effect it produces on us, we are forced to admit that the total impression is far below what the first impression had led us to expect. And this is not due to a falling off in the merit of the execution, but rather from the sense that the poet has after all been engaged on a task that is beneath him, or at least that does not offer full scope for his power. The *Orlando*, to say the honest truth, is dull when we attempt to read it as we read other poems; it is fascinating when we read it bit by bit. It seems trivial and frivolous when we reflect that it is the poetical master-work of so great a man and so great an age. The writer is in earnest with his style and form, but not with his subject. There are plenty of passages in Ariosto full of dignity and tragic power; but they are scattered about here and there in his poem. The ground-tone of it is graceful irony; and this tone, though charming here and there, as the break or enlivenment to a more serious strain, becomes itself tiresome when it is protracted through forty or fifty thousand lines of poetry. Not only does the *Orlando* gain greatly by being read piecemeal, but it must have gained still more by being recited, as was commonly a custom at that period, canto by canto. There is much in it which would be greatly enhanced by skilful and dramatic recitation. It contains few or none of the countless passages in Dante and Shakespeare which have to be taken to heart and dwelt on before they can be truly apprehended. It aims at a momentary effect; and this effect is experienced by a listener more easily than by a reader. We have only to try the experiment with a few stanzas delivered by a good reciter to perceive the force of this contrast. There is little in Ariosto to feed on or to muse on. And yet, so great is his power, that we cannot help demanding from him that which he is unable to give. More than almost any other poet, he makes us quarrel with what is good because it is not better. In his case, as Mr. Symonds truly says, we must bear in mind the influence which at this period painting had on poetry, and which caused it to assume a pictorial and external character, to the neglect of the deeper elements of thought and feeling which are peculiarly its province. There are other reasons also why a great poet could not then find the atmosphere needed for the best poetic work—the absence of any genuine national and political life; the pre-

\* *Renaissance in Italy; Italian Literature.* By John Addington Symonds. In Two Parts. London: Smith, Elder, & Co. 1881.

vailing tendency, so fatal to literature itself, to take nothing seriously but literary or artistic interests; and a moral and social corruption so deep and widespread as to drive every thinking man to be either a cynic or a prophet of retribution.

There are few chapters in Mr. Symonde's work which may not be read with interest and advantage, especially those in which he deals with the purely literary aspect of the age. Many, however, of his general or philosophical reflections seem strangely superficial and unsound. "Nature," says the writer, summarizing the teaching of Valla, "nature can do nothing wrong; and that must be wrong which violates nature. It is man's duty, by interrogation of nature, to discover the laws of his own being and to obey these. In other words, Valla, though in no sense a man of science, proclaims the fundamental principle of science, and inaugurates a new criterion of ethics." In a note to this passage what Valla means by following nature is explained to be simply obeying sensual appetite. Now, in the first place, there is nothing whatever new in Valla's unabashed assertion of hedonism; it is as old as the human race, and it is daily exemplified by the beasts that perish. And in the next place it is in no sense a criterion of ethics, for all ethical systems worth consideration, even those which make pleasure the end of human action, insist on the subordination of temporary or personal pleasure to the permanent good of the individual or of the world at large. A more barren formula than "Follow Nature" was never invented; we all agree to it, but all differ as to what nature is, and how she is to be followed. But probably Mr. Symonde's remark is to be taken as rather rhetorical than as expressing his real opinion. With the English of the book we must again find fault; "resume" in the sense of "to sum up" as in the French *résumer*, "banality," a "back thought" for an *arrière pensée*, "civility" for civilization, and the like, cannot be regarded as improvements on the plain English to which we are accustomed, or as exemplifications of Cæsar's maxim to avoid an out-of-the-way word as we would a rock. One more remark it is necessary to make. Mr. Symonde protests, and with perfect justice, against the view that an analysis of the literature or manners of the Renaissance implies any desire to hold up the corruption which marks both as something to be imitated or as something even venial. Such a charge, if it has been ever made, needs no refutation. But there is another question, and that is how far it is desirable, in a work intended for general circulation, to give a minute account of customs and of writings which it is painful to dwell on, so profound is the heartless corruption which they reveal. The question is one of degree, and must be settled in his own way by each individual writer. A great age cannot be excluded from historical criticism because of the turpitude which marks it. In the Renaissance especially we find this union of what is noblest and most attractive with what is vilest and most hateful; and it is impossible to study the one without being forced to consider the other along with it. But it is to be regretted that the iniquities of the period should receive fuller illustration than is required for the purposes of impartial history; and, if the charge referred to above has been made against those who have written on the Renaissance, it is probably because this limit has not always been strictly observed.

#### MADAME DELPHINE.\*

IN this remarkable story an American novelist, who has already achieved a reputation in his native country, for the first time brings his name before the English public. As the author of a collection called *Old Creole Days*, and of an interesting novel entitled *The Grandissimes*, Mr. Cable has already shown himself to be master of a new field in fiction—namely, the curious Creole and Quadroon population of the city and environs of New Orleans. In *Madame Delphine* he takes a series of idyllic scenes from the same unexhausted source, and delights us with pictures of a strange, old-world, timid civilization of which it is safe to say that English readers know nothing. Those who have read the *Grandissimes* must not expect to find in *Madame Delphine* any situation so tragically pathetic as the death of the old, indomitable African king; in his latest story Mr. Cable has given himself up to the warmth and perfume of the tropical city, to the romance rather than to the tragedy of its population, and to the pathos of its divided races. At the same time, a certain dimness of style that gave a hazy effect to some of the pages of the earlier novel gives place in *Madame Delphine* to a more incisive and exact manner of writing. It should be said at once that Mr. Cable writes exceedingly well, with a rich and musical prose that suits his subject; his fault as a stylist is that he introduces too incessantly a profusion of ingenious detail, and is not content to let enough simplicity divide his "purple patches" from one another. But this severity is "what Nature never gives the young," and its absence is not to be very sternly reprimanded in the present dearth of novelists who take any thought whatever about their style.

It will give at once an idea of Mr. Cable's manner of writing, and of the scene to which he introduces us, if we quote from his pages a description of that part of New Orleans in which, some sixty years ago, the incidents related in *Madame Delphine* took place:—

You find yourself in a region of architectural decrepitude, where an

ancient and foreign seeming domestic life, in second stories, overhangs the ruins of a former commercial prosperity, and upon everything has settled down a long sabbath of decay. The vehicles in the street are few in number, and are merely passing through; the stores are shrunken into shops; you see here and there, like a patch of bright mould, the stall of that significant fungus, the Chinaman. Many great doors are shut and clamped, and grown grey with cobweb; many street-windows are nailed up; half the balconies are begrimed and rust-eaten, and many of the humid arches and alleys which characterize the older Franco-Spanish piles of stuccoed brick betray a squalor almost Oriental.

Yet beauty lingers here. To say nothing of the picturesque, sometimes you get sight of comfort, sometimes of opulence, through the unlatched wicket in some *porte-cochère*—red painted brick pavement, foliage of dark palm or pale banana, marble or granite masonry, and blooming parterres; or through a chink between some pair of heavy batten window-shutters, opened with an almost reptile wariness, your eye gets a glimpse of lace and brocade upholstery, silver and bronze, and much similar rich antiquity.

In the midst of this moss-grown suburb, a low brick house in the middle of a square preserves a close and discreet aspect which is noticeable even in so retired a neighbourhood; sixty years ago the wall of this house enclosed an ill-kept, shapeless garden, full of untriumphed roses and tangled vines, where, in the walks of pounded shell, the coco-grass and the crab-grass had successfully asserted their right to exist. The little house itself was muffled in jasmine and crape-myrtle, and deeply overshadowed by branching orange-trees, the whole forming an odorous and umbrageous retreat in the midst of the tropical city. And in this sequestered place lived Mme. Delphine Carraze, a little quadroon woman with faded eyes. In those days there existed in New Orleans a class which had sprung up between the Creoles and the negroes, and which belonged to neither. This was the free quadroon caste, a race illustrious for the extreme beauty and grace of the women, often almost absolutely white, with massive regular features, lustrous eyes and hair, and manners of the most bewitching grace and refinement. Yet, by the whim of that cruel law which forbade marriage with a white man until the ninth departure from the negro had been reached, these lovely quadroons and still lovelier octoroons were unable to form any legitimate attachments with men scarcely their equals in social standing. Out of this evil state of legislation there arose a condition of things which encouraged a universal laxity of manners, and which entailed, at the best, shame and embarrassment on the next generation. Mme. Delphine was euphemistically called the widow of an American, with whom she had long lived happily in this house of perfumes and shadows; but he had been dead nearly twenty years, and she was still living on the property which, in defiance of the law, he had left her. Their one child had been brought up in the North by his mother and sisters; but, after being separated for sixteen years, the mother's heart had yearned for her daughter, and Olive was now on her way back to New Orleans to live with Mme. Delphine.

We are next introduced to a quartette of very oddly-assorted friends. Père Jerome, a little fat priest; Evariste Varrilat, a doctor; and Jean Thompson, an attorney, are characters which Mr. Cable draws rapidly, but with a firm hand. These three are united in adoring and in lamenting a fourth, who should complete their number, but who has unfortunately adopted the profession of pirate and smuggler, and upon whose head the American Government has set a price. This is Capitaine Ursin Lemaitre, a weather-beaten young man of thirty, with noticeable eyes, who has been trained, rather against his nature, to remember "that none of your family line ever kept the laws of any Government or creed." He is doing a brisk, but highly illegal, trade between Cuba and Louisiana, darting occasionally over to New Orleans with the spoils he has taken along the northern coasts of the Antilles. It greatly shocks and grieves Père Jerome that his Ursin, who is the very pink of courtesy and gallantry, should have taken to such a life, but he cannot persuade the other two friends to see anything but a rare good joke in the whole matter. At last a wonderful story reaches the Creole suburb—namely, that a ship sailing from the North to New Orleans was boarded by pirates, and would have been ransacked, had not a beautiful girl stepped up to the captain, with a missal in her hand, and, pointing to the Apostles' Creed, commanded him to read it. Upon which he drew off his men, and left the vessel to make her way to New Orleans unmolested. This story creates a great sensation, and there is much speculation as to who this freebooter can be who was so suddenly converted by a passage in a missal. Varrilat and Thompson guess that it is their friend Lemaitre, and decide that he must have fallen in love with the beautiful heroine of the adventure. But the simple-hearted little priest will not hear of this worldly interpretation, and determines, on the other hand, to make this edifying circumstance the theme of his next sermon in the cathedral.

Among his auditors are Mme. Delphine and her lovely daughter, lately arrived from the North, and also, as the reader gradually perceives, the pirate himself. But something in the audience, a face or a movement, suddenly changes the current of the dear little priest's mind, and just as he is coming to the point of his story, and about to tell how the missal in the hands of a beautiful girl converted that desperate freebooter, he falters and stops, turning the anecdote into a less personal tale of how the fine order and exquisite appropriateness of nature so affected the pirate's mind in solitude, he being himself a very orderly person, that he determined to quit a mode of life so contrary to the design of nature. The audience is perhaps a little disappointed, but edified upon the whole, and Mme. Delphine is so much touched by the benevolent air of Père Jerome, that she determines to make him her

\* *Madame Delphine: a Novella; and other Tales.* By George W. Cable. London: Warne & Co.

confessor, and obtain his help and counsel in the terrible responsibility of her newly found daughter. Meanwhile Capitaine Ursin Lemaitre has not been miraculously converted by the missal, but he has fallen hopelessly in love with the girl who presented it to him, and in order to find her out he has given up his ship, said farewell to his men, and come back to live at New Orleans. But to do this is to endanger his head, and he is obliged, therefore, to adopt a disguise. He opens a bank in the Rue Toulouse, under the name of Vignevielle, it being known only to his three friends that the banker Vignevielle is one and the same man with their old comrade Ursin Lemaitre. But neither Varrillat nor Thompson suspects for a moment that the returned prodigal is in love, and if Jerome guesses it, it is more by an intuition than anything else; for Vignevielle, who used to be so frank, has become excessively reserved, neglects his business markedly, even for a Creole, and spends so much of his time wandering around the city, and peeping into windows and doorways, that he gradually gets a reputation for being crazed. Of course it is the beautiful octoroon for whom he is searching, but she is so carefully hidden in the shadows of that discreet garden full of orange-trees and crape-myrtle, that he never catches a glimpse of her. At last, one moonlight night, in a scene which is the gem of the book, and described with an exquisite charm of style, he pushes a gate open in his usual way, glancing and searching, and there, listening to the mocking-bird, with her face lit up by the moonlight against the rich darkness of the orange-tree, is the girl that he has been looking for so long, and he learns, what the reader has long ago found out, that it was Mme. Delphine's daughter Olive who faced him on the ship.

It would not be fair to Mr. Cable to tell the plot any further. How the hero contrives to become acquainted with Mme. Delphine, how the unsurmountable barrier between him and Olive is honourably removed, how roughly the course of their true love runs, and what a sublime sacrifice is made at the last by poor old Mme. Delphine, for all this we must recommend the reader to the pages of the novel itself. He is not likely to put the book down until he has finished it.

We think that a novelist's quality is often best shown in his conduct of a short story. *Madame Delphine* is followed by three tales, which really form part of the same study of old Creole life. The first of these, *Belles Demoiselles Plantation*, would be more striking if the reader were not irresistibly reminded by its conclusion of Edgar Poe's *The Fall of the House of Usher*. It might very well have been written by a man who had never read the earlier story, but for readers of Poe the similarity destroys the necessary shudder of surprise. *Madame Delicieuse*, on the other hand, is one of Mr. Cable's perfectly original pictures of the glittering, lazy, graceful life of the Creole population in its old palmy days. But we recommend any one who is still unconvinced that in Mr. Cable we have gained a novelist with new powers and of brilliant promise to read the last story, *Poison Jone*; we have every confidence in the result. For, unless we are greatly mistaken, he will recognize in the treatment of this short tale a skill in depicting riotous Southern masses of people, in full sunlight, moved by sudden passion to the exercise of whimsical and cruel revenge, combined with a sense of the gentleness and placability which make these races a paradox to Northerners, such as no writer of modern times, except Flaubert, has displayed. The destruction of the circus, and the horrible game played with the tiger and the buffalo, in this story of *Poison Jone*, may be recommended as certain to give the jaded reader that *frisson nouveau* of which he is so much in need. We must add a word on the dialect which Mr. Cable uses. It is new, and must be learned; but it is simple, and easy to learn. It is merely an alternation of French corrupted by English, and English directly translated from French; a soft and languid speech, invented by the easy Creole for his needs.

#### COLVIN'S LANDOR.\*

"NOT to know," writes Professor Colvin on the first page of this little volume on Landor, "not to know what is to be known of so remarkable a man is evidently to be a loser." Not to know what is to be known of all remarkable men is, no doubt, to be a loser, but the loss is one to which the wise will oftentimes submit patiently. The amount of knowledge that can be gathered by even the most unwearied student is small indeed. Some choice must be made in picking up the pebbles and the shells on the shore that is washed by the great ocean of truth. Of many great men—of most great men—we must contentedly remain in profound ignorance. For among the famous dead it is not acquaintances, but friends, that we should seek. We should know a few well, and let the rest pass by us, honoured, indeed, on the report of others, but not loved for that worth which we have ourselves tried, and tried thoroughly. If we have the command of a good library, it is no levée of an American President that we should hold. We should not summon a throng to pass before us so rapidly as to allow ourselves scarce time to learn each man's name and to give him a hasty shake of the hand. We read for our own instruction and for our own pleasure. In the midst of our books, if anywhere, we should lay aside all

hypocrisy, all pretence of knowledge without the reality, and taught by them should, without the least feeling of shame, own not only to others, but still more to ourselves, how little it is that we know and how much there is to be known. Let us often say, as young Isaac Newton, in Landor's Dialogue, said to his friend and tutor, "I am slow, and there are many parts of ordinary learning yet unattained by me." We cannot but fear, however, that these handbooks and manuals of literature and men of letters, which are springing up as fast as September mushrooms after warm showers, are a sign that there is at present in a high degree a restless desire for the appearance of knowledge, while there is but an infirmity of purpose for attaining its reality. The source of the evil may likely enough be found in the modern system of examinations, which in its deadening effects on genius is, we verily believe, only second to the Goddess Dulness herself. Examinations beget handbooks, and handbooks beget both ignorance and conceit, which in their turn, uniting in marriage, bring forth more handbooks.

In thus passing a sweeping sentence on manuals of literature in general, we ought, perhaps, to except those which are written by men of ability, who are masters of the subject which they have taken in hand. Their works may serve either as an introduction to those who intend to study an author, or as a critical review to those who are already familiar with him. When, however, as too frequently happens, the attempt is made to combine these two kinds of writing, the result must almost certainly be a failure more or less complete. Passages which may be instructive to the ignorant are wearisome beyond measure to the student, while in the criticisms and the summing-up in which he takes an interest his fellow-readers must find themselves out of their depth. In the work before us, for instance, Professor Colvin keeps, as it were, one eye fixed on the lowest form and the other on the highest in the daring attempt to teach both at the same time. While he instructs those at the bottom of the school, those at the top will first begin to yawn, and then fall asleep; while, if he bestows on these too much of his time, the others will take to playing, or will give their master the slip altogether. Take, for instance, the following account that he gives of the third volume of the *Imaginary Conversations*:—

Landor's materials for his third volume comprised no less than twenty dialogues, including one very long, rambling, and heterogeneous, between the Duc de Richelieu, a vulgar Irish woman of title, a general also Irish, and a virtuous English schoolmaster turned sailor. With this were associated some of Landor's best brief dialogues of character and passion, notably the Roman two of Marcellus with Hannibal and Tiberius with Vipsania; several of his monumental satires against tyranny and superstition, including the terrible dialogue of Peter the Great with his son Alexia, and the playful one of Bossuet and the Duchesse de Fontanges, a discussion between Rousseau and Malesherbes, which is one of the best of the modern meditative class, &c.

Now we put it to any fair reader, however evidently a loser, to quote again the Professor's words, it may be, not to know what is to be known of so remarkable a man as Landor, is the knowledge increased, and the loss so far lessened, by passages such as the one we have just quoted? If we came across a student who had never seen a copy of Shakespeare, should we do him any good by telling him that the book comprised no less than thirty-seven plays, including one—very long, rambling, and heterogeneous—between a wicked King of Denmark, a mad Prince, a young lady, also mad, and a virtuous King turned ghost; while with this were associated some of Shakespeare's best dialogues of character and passion, notably the Italian two of Antony with Cleopatra and Romeo with Juliet? Should we even give him any analysis of the various plots, any account of Shakespeare's life, or any criticisms of his writing? We should simply place in his hand the plays and bid him read them, telling him that, if he were to know all that had been written about Shakespeare from the Elizabethan age to the present time, and yet had never read him, he would be more ignorant of the poet than a man who knew only a single play and had never even so much as heard that there were any commentators at all. In like manner, if Landor is to be known as a writer, he can only be known by those who will take the trouble to read him. There is no popular path to that great and strikingly original genius. Each man must beat his own way as he strives to follow him. "He walked along the far eastern uplands, meditating and remembering," writes Professor Colvin, quoting his hero's fine saying, "and to the far eastern uplands," as he goes on most justly to maintain, "those who would walk with him must brace themselves to mount." But then let them begin the ascent not by going into a panorama or peeping into a *camera obscura*, but by that side of the mountain where it will be easiest to climb. Let them take the shorter dialogues, let them read them and not read about them. Tiberius and Vipsania, Marcellus and Hannibal, Metellus and Marius, taken together are far shorter than many a speech made on the Irish Land Bill. Let them next take a longer dialogue, choosing one in which the characters are men in whom they have a strong interest, or with whose writings they are familiar. They will soon find out whether they are "true Landorians," to use Professor Colvin's words, "who may at present," he says, somewhat rashly perhaps, "be counted on the fingers." If they are not interested, if they cannot see in Landor the greatness which others find, let them not be discouraged. Let them neither come to a hasty judgment, nor feign an enthusiasm which they do not feel. Let them remember how he of all men most scorned affectation, and how he would in a fury have thrust out of his house a worshipper whose insincerity he had detected. Let them wait a few years.

\* Landor. By Sidney Colvin, M.A., Fellow of Trinity College, and Slade Professor of Fine Art, Cambridge. London: Macmillan & Co. 1881.

A liking for him may come with time, for he writes for "the full man" who is made and made only by reading.

Professor Colvin says that "a selection or golden treasury of Landor's shorter dramatic dialogues . . . would be, as was said long ago by Julius Hare, one of the most beautiful books in the language, that is to say in the world." Against such a selection not a voice could be raised; for it would no more be incomplete than a chance volume of Shakespeare's plays. Each dialogue stands by itself, and suffers nothing by being removed from its neighbour. On the contrary, we are inclined to think that they all suffer by the artificial arrangement of the latest editions, in much the same way as Wordsworth's poems suffer by their classifications. But when the Professor goes on to suggest that from the longer dialogues a selection for popular use might, perhaps, be made "on the principle adopted by Mr. Hilliard—a selection, that is, of detached sentences and sayings"—there we are dead against him. Landor's Dialogues do not belong to the class which Bacon described. They are not of those which "may be read by deputy, and extracts made of them by others." They are not "of the meaner sort." He knew that his day would not come till all days were alike to him; but he was content. "I shall dine late," he wrote, "but the dining-room will be well lighted, the guests few and select." He would have been little pleased, indeed, had he known that the plums would be picked out of his pies, and scattered to a lazy crowd waiting below the windows in the street. Let not our editor trouble himself about "what has to be done in order to extend to wider circles the knowledge of so illustrious a master." Let him remember how Landor has himself in his own noble words described the progress of those writers "who are to have a currency through ages." "In the beginning," he says, "they are confounded with most others; soon they fall into some secondary class; next into one rather less obscure and humble; by degrees they are liberated from the dross and lumber that hamper them; and being once above the heads of contemporaries, rise slowly and waveringly, then regularly and erectly, then rapidly and majestically, till the vision strains and aches as it pursues them in their ethereal elevation." It is not through extracts that the great writer gets known, so far as he ever does get known, to the little readers. It is through those who have sat at his feet, who have loved him, followed him, honoured him, learned his great language, caught his clear accents, made him their pattern to live and to die, that the master makes his voice heard throughout "the world's great school-room." He changes the few small loaves into a bountiful meal, and they in their turn hand the food about among the surrounding multitude. But the miracle lasts from age to age, and the distribution calls for prolonged and unwearying service.

There is one side of Professor Colvin's work which we have not as yet considered—his sketch, namely, of Landor's Life, and his criticisms of his writings. He has carefully examined the various accounts that we have of this great man, and he has spared no pains in working up the materials into a whole. The sketch is readable, and in parts interesting even to those who were already well acquainted with the main facts. But greater praise than this it does not, we fear, deserve. The criticism is of a higher order, though even this, from faults of style which we shall presently point out, is scarcely worthy of the subject. The following passage will show the Professor at his best:—

The massive individuality of Landor's mind was accompanied, as we have seen, by a many-sided power of historical sympathy, which made him at home not in one only but in several, and those the most dissimilar ages of the past. The strenuous gravity and heroic independence of Puritan England had entered into his imaginative being, as well as the contented grace and harmonious self-possession of ancient Hellas. But of all things he was perhaps the most of a Greek at heart. His freedom from any tincture of mysticism, his love of unconfused shapes and outlines, his easy dismissal of the unfathomable and the unknown, and steady concentration of the mind upon the purely human facts of existence, its natural sorrows and natural consolations, all helped him to find in the life of ancient Greece a charm without alloy, and in her songs and her philosophies a beauty and a wisdom without shortcoming.

Far too many passages, however, of Professor Colvin's writings are marred by faults into which no "Landorian" should ever fall. Landor, to use his own words, was "a magistrate in language." We only wish that a few of our modern writers "were," to carry on the quotation, "brought before him, and obliged to undergo his sentence." If he is to be made known to wider circles, let the knowledge be spread by showing that there are those who are willing and eager to work under him in restoring the purity of our language. "The days of pure English are over," he wrote in his old age; "as people do not perceive the loss of freedom until it is utterly gone, neither do they the loss of language; nor would they be persuaded though such a prophet as Milton rose from the dead." Professor Colvin does not seem to differ from Landor in this. "Nor was there ever a time," he writes, "when a sentinel [over the English language] was more needed." He points out how Carlyle, Dickens and Macaulay, had each in his way accustomed Englishmen "to find their language forced into all manner of startling or glittering usages, of extravagant or unquiet forms and devices." By the way, in the sentence that comes just before "the sentinel" he falls into a grammatical blunder. "So massive and minute a literary acquaintance with his mother-tongue, combined with so jealous and sensitive an instinct in its verbal criticism have (*sic*) probably never existed in any other man." But it is not with errors of grammar that we are troubling ourselves at present. Our complaint is that our author does not always take care that his words have any meaning. If a meaning they have in these cases, it must, at all events, be a conventional one. What, for instance, we may with good reason

ask, is "a massive literary acquaintance with our mother-tongue"? Later on we find Landor "idealizing peccadilloes into enormities, and denouncing and seeking to have them chastized accordingly." As my Uncle Toby owned that he never rightly understood the meaning of the word analogically, we too are not ashamed to confess that we never rightly understand all the meanings of this word that is in so high favour just at present—idealizing. But, allowing that peccadilloes can be idealized into enormities, how are we to explain the rest of the sentence?—"denouncing and seeking to have them chastized accordingly." What is it that was denounced? It is not a word that can stand by itself, and yet there is nothing that rightly belongs to it. Passing on we come to the following piece of criticism:—"The true strength of the discursive *Conversations* resides in the extraordinary richness, the originality of the reflexions and meditative depth and insight scattered through them—reflexions generally clenched and illuminated by images, and adding the quality of beauty to the qualities of solid ingenuity or wisdom." Here is a fine clatter of words, but little we fear more than a clatter. Ixion tried to grasp the cloud, but what was his attempt when compared with images that clench reflections at the same time that they illuminate them? But worse than this—through these reflections is scattered not only a depth but a meditative depth. It is in these image-clenched, image-illuminated, and depth-scattered reflections that the true strength of Landor's *Conversations* resides. Since the days when strength resided in Samson's hair, we doubt whether it has ever found a stranger home.

Once more passing on, we read:—"In his work, as it seems to me, Landor is a great and central artist in his mother-tongue, and a great creative master of historic sentiment and of the human heart." A central artist in his mother-tongue is no doubt very commendable as a good phrase, but possibly it may be found by some as hard to explain as accommodated was found by Bardsolph. We are reminded how Landor said that "the establishment of an academy for painting has much infected our language. If we find five metaphors in a chapter, four of them are upon trust from the oil-and-colour-man." Through want of space we must content ourselves with merely noting such phrases as "a shining promise which smouldered off into disappointment and mediocrity," "a cultivator of men of genius," "a voice lustrous in all its tones," "a story lightning-lit with flashes of romance," "unmitigated and Titanic tragedy," "the essence of proud urbanity and compendious force," "a pointed and clenching method," and, perhaps worst of all, "he commissioned a bust." If Landor, in his strong way of speaking, maintained that "none but a sugar-slave would employ the verb *originate* actively," what abuse might he not have poured on the commissioner of a bust?

It is disappointing to find that the careful study of one of the greatest teachers of style and one of the greatest masters of English has borne no better fruits than these. We shall not, we fear, have the younger men on our side, for of the new kind of writing that has so rapidly sprung up they are the staunchest adherents. Their admiration outstrips by far their understanding. Yet, if in the midst of the applause that they bestow on their favourite writers, they were forced to try to explain the meaning of the words that so tickle their ears, they might now and then have to confess, in the words of Epimedeus in Landor's "Pericles and Aspasia," "I could not understand one word in twenty, and what I could understand was sheer nonsense." That the day may quickly come when, of their own free will, they shall make this confession, the day when "men of plain, simple, sound understanding" shall be once more, if not the judges, at least the acknowledged jurors of our language, must be the earnest prayer of every "true Landorian." So far as Professor Colvin's book tends to bring this day nearer we can give it a welcome. But when that happy time has at length come, then we fear that one "true Landorian" will find that some of his readers have given him the slip.

#### COUNTRY PLEASURES.\*

*COUNTRY PLEASURES* is addressed, and ought to be dedicated, to real lovers of the country, nor do we know that we have ever read a more fascinating book of the kind. City-bred folks, though they can hardly fail to be pleased by the charm of its style, will scarcely appreciate its more delicate beauties. We cannot say that Mr. Milner makes much of little; for there is no nobler subject than nature, and in the infinite variety of nature's works, none are unworthy of minute attention. This very volume of his is proof to the contrary. But it needs something of a regular rural apprenticeship to understand the depth and tenderness of the associations that may be awakened by some apparently insignificant flower; to enter into the feelings which can be agreeably excited in blustering storm or blinding sleet; to follow with interest the sympathetic descriptions of land, sea, and sky in all aspects of the weather; and to realize, in short, that an uneventful country existence may be full of events and sensations though it seems dull and monotonous. But there are few lovers of the country, we fancy, however much they may pride themselves on their knowledge of things rural, who will not acknowledge Mr. Milner for their master. His has been a life of that close observation which has ripened with habit almost into intuition, and so he has accumulated the miscellaneous

\* *Country Pleasures: the Chronicle of a Year, chiefly in a Garden.* By George Milner. London: Longmans & Co. 1881.

stores of information which make him the most intelligent and trustworthy of guides as he is the most agreeable of instructors. He is an enthusiastic gardener, though he has studied his gardening in the school of nature rather than under professional experts. He is a good naturalist and a practical botanist, and he has the genius of an artist, as we see in the pictures after nature that are scattered everywhere over his pages. Few men know better how to translate into words, each of which has its definite meaning, his clear impressions of natural objects as he has viewed them through different atmospheric effects. But, above all, what gives its most distinctive character to his volume is the range of his acquaintance with the English poets. He presses them all into his service, or, rather, he borrows their brightest ideas, though never without acknowledgment, with the flattering freedom of an intimate friend. And any one with a fair knowledge of poetry will be astonished to find how many beautiful rural allusions have eluded his notice in a general perusal of the works of our poets. For Mr. Milner has read them all with a purpose, and nothing that fell naturally within the sphere of his tastes appears to have escaped his retentive memory. Were we to glance through his pages for the quotations alone, the book must still leave delightful recollections. But, to do the author ordinary justice, we ought to remark how happily each of the quotations falls into its place; how gracefully it suggests an appropriate train of thought; or how justly it illustrates one of his characteristic reflections.

Necessarily, in describing his home and his haunts, Mr. Milner has painted himself and his habits, till we seem to know him almost as well as we know his old-fashioned garden. He likes to perpetuate old traditions, and to preserve the memory of old English festivals. In his neighbourhood the bustling enterprise of the present rubs shoulders with the relics of the past; and his house stands now almost in the suburbs of one of the great and growing Lancastrian manufacturing towns. But, almost under the shadow of smoky chimneys, he still kindles the yule log on Christmas Eve, and decks the rooms with mistletoe and holly; and the decorations are left to wither upon the walls till cleared away with all due solemnity at Shrovetide. And the work of removal must be done carefully, under heavy supernatural penalties; for, as Herrick sung in a quaint poem that is quoted:—

For look how many leaves there be  
Neglected there; maids, trust to me,  
So many goblins you shall see.

The bonfire blazes on the 5th of November, while all the household joins hands for the ceremonial dance round the blaze. But festivals like these are celebrated at long intervals, and the plan of the book is keeping a regular journal of the slight incidents of the weeks and the seasons. As Mr. Milner announces in the title-page, it is the "chronicle of a year, chiefly in a garden," and the garden must be a very pleasant one. He has no great fancy for the modern fashion of setting trim flower-beds ablaze with masses of gorgeous bedding-out plants. He rather recommends leaving nature to herself, and he joins practice to precept. He cultivates the English flowers of long descent—though, indeed, they need but little cultivation—many of which have been glorified by his favourite poets. Nor does he greatly object to what we call weeds, when in their proper places; and, above all, he delights in the drooping foxgloves, which have a special bank in his garden devoted to themselves. There are wild flowers of many species, besides, in the little woods and the orchards; there is a glen which shows a rich variety of forest foliage; and there are rough pieces of meadow and untrimmed hedgerows. Where there are thickets and dense patches of laurel and rhododendron, with luxuriant ivy and climbing plants clinging to old walls and buildings, of course birds swarm, though the city is so near. Nothing is more interesting than some of Mr. Milner's notes on nesting-time and the situations of nests, and the rapid growth of the nestlings. He points out the absurdity of popular notions as to the unerring instinct which is supposed to guide birds in concealing their nests. It is true that some of them, like the wary chaffinches, choose the materials of the very colour of the bough which gives its support. But others, such as the "poor foolish thrush," actually appear to court observation; and nothing but its extreme fertility can save the race from extinction in districts where many bird-nesting boys are abroad. Then there are others which, building in open fields near the ground, confide eggs or broods to the chapter of accidents. He mentions one nest of the meadow-pipit which he stumbled upon, though most ingeniously concealed in a tuft of coarse rushy grass; but which all the same might be wrecked at any moment by some grazing animal crushing it under foot. While the starling, on the other hand, shows a happy mixture of cunning and confidence. "Here is the starling creeping through a small hole in the tiles to his snug nest. His sense of security makes him impudent; he stands and looks at you with his head cocked up, and goes in and out of the house with an unnecessary frequency, as if he would say, 'This is where I live, and I don't care if you know it.'" As for the rapidity of the growth of the young, we have it carefully noted in the story of a hedge-warbler's family. On May 10th the young were out of their shells, and huddled together in an undistinguishable jumble in the bottom of the nest. Five days afterwards they had already grown too big for it; so that one was always being smothered under his three companions, who were gaping open-beaked for food. "All birds' nests," Mr. Milner observes, "seem to me to err by defect"; or,

in other words, they have not been constructed with an eye to the inevitable expansion of their inmates. On May 18th the young warblers looked ridiculously large, so that it seemed as if they must either fly or fall. And on that evening, or the following morning, fly they did, and only nine or ten days after they had struggled out of the shell.

But we should give a very imperfect notion of Mr. Milner's book if we implied that it was occupied altogether, or even chiefly, with mere notes on natural history, botany, and gardening. It abounds in passages of minute and most exact description, inspired by a genuine artistic feeling, and in bits of poetic meditation and moralizing that have nothing pedantic or affected in them. Indeed, it is difficult to make selections for quotation, because the style is always easy and natural; so that we are rather pleased by the effect of the whole than impressed by any particular passages. But here is a reflection suggested by the stillness of a winter night which attracted us by its truth as by its simple beauty:—"It is at night, however, that the feeling of winter is most strong; and the *dumbness* of it is the first thing that strikes you; there is much to see, but nothing to hear. The watercourses are frozen; the birds are all hidden—who knows where?—and the winds are still; but how beautiful are the white leaning roofs of an old homestead, and the red glimmer in the windows of the neighbouring farm, seen across a long stretch of snow; and how marvellously the stars seem to dance among the black branches of the trees." Nor does Mr. Milner confine himself in the chronicle of his year to notes on his own home in Lancashire. Although even when there he is by no means limited to the bounds of the pleasant garden and farm, for the place lies within easy reach of the hills, and many is the ramble that he takes over the expanse of the lonely moors. Some of his best chapters are dated from North Wales, or the neighbouring seashore, or from Shropshire, and, above all, from the island of Arran, where he invites us to spend the months of August and September. But, wherever he goes, and though he changes from plain to hill, or from the shady lanes of the Midland Counties to the sands and flats of the seacoast, there is never a breach in the continuity of his work. He says himself that in making a move, it is his first object to find points of pleasant contact between the old home and the new, and in that he undoubtedly succeeds. A chief point of contact he finds in the wild flowers. Even in Arran they are much the same as in the neighbourhood of the smoky Lancastrian towns, though many of them may be more beautiful:—

In the thicket behind the garden here the wild bramble trails its prickly stem and its white flowers up and down, just as it is doing now in the thorn hedge above the foxglove bed in our own garden far away; and as we ascend the lower and pastoral slopes of the mountain we see all our old favourites—the brilliant dandelion; the little red-tipped bird's-foot; the delicate eye-bright; the blue campanula, swinging its airily-lunged bells in every faint breeze; and the daisy, with its yellow disk and its white rays reduced to one-fourth their usual size, but brighter than ever—a perfect diamond in the green pasture.

He goes on to remark that the higher one climbs the smaller, but more vivid in colour, the flowers become. And the remark will be confirmed by every one who remembers the lustrous brilliance of the wild flowers in the upper meadows on the Alps and the Pyrenees, notably of the little blue gentianellas where they enamel the borders of some mountain pool. But our experience, so far as it goes, confirms the accuracy of every one of Mr. Milner's observations; though we confess that in reading his book we have learned among other things how little we know and how unobservant we have been. We see lists of volumes every day advertised as suitable for the holiday season; but to those who are contemplating tours in the country we can recommend no volume more heartily than these simple and beautiful "Country Pleasures."

#### LIFE OF VOLTAIRE.\*

NOBODY can say that a Life of Voltaire was not wanted in English, for there is really nothing of the kind on any sufficient or satisfactory scale. There are, indeed, certain very well-known essays on the subject, but they deal for the most part with inferences rather than with data. It is, however, but a short time since M. Desnoiresterres's elaborate series of volumes was finished; while the Voltaire centenary of three years ago produced a flood of writing on the subject, some of it worthy to be taken into account; and the progress of literary investigation is constantly unearthing fresh work of the indefatigable philosopher's own. In default of a better, Mr. Parton's work will be useful enough, but it is only in default of a better. We have not often read a book which was fuller of small blunders. The enumeration of these would be tedious enough, but we hardly remember to have noted down a longer list against a book of the kind. At one time it is a slip in nomenclature, such as *Jean Stobée*, *Denys* of Halicarnassus, and so forth. At another it is ignorance of the details of history, such as the statement that Congreve left his fortune to Duchess Sarah of Marlborough. At another it is bibliographical errors. Of these last there is a glaring example at the very beginning of the book. "In a satirical romance," says Mr. Parton, "published when Voltaire was a boy, there is," &c. This satirical romance is explained in a footnote to be the *Roman Bourgeois*. Now Voltaire was born in 1694, and

\* *Life of Voltaire*. By James Parton. 2 vols. London: Sampson Low & Co. 1882.

the *Roman Bourgeois* was published in 1666. Mr. Parton is therefore a good half-century out—for in his footnote he quotes the 1712 edition, apparently under the impression that it is the first—as to the date of not the least remarkable work of fiction of the French seventeenth century. In itself the error is nothing; but it gives a very definite and unsatisfactory idea of the writer's ignorance of general French literary history.

Inaccuracies of detail, however, may be too severely as well as not severely enough visited. They have often been shown to be compatible with a real grasp of the general history of a person or a period, and with a real power of representing that history. It is awkward certainly for the trusting disciple; but *caveat lector* is perhaps as good a maxim as *caveat emptor*. But it is otherwise with certain radical faults of general handling and view. When a biographer commenting on the history of the Arouets says, "probably the family had been established in the neighbourhood for generations. An ancestor may have witnessed the battle of Poitiers," &c., a kind of despair seizes the reader. History by peradventure is surely not worth writing, and still less worth reading. Nor is this Mr. Parton's only excursion into that most unprofitable region. All readers of Voltaire's pleasing story of his English travels remember the highly symbolical account of his adventures when he landed at Greenwich. "He observed," as Mr. Parton's version has it, "a prodigious number of well-formed young people on horseback cantering round a racecourse." Instantly Mr. Parton's imagination is on fire. He is, let it be observed, an American, and his book is written rather with a view to the United States than to England as it would appear. "Ben Franklin was a journeyman printer in London then. What more likely than that he was at Greenwich that day? He may have been one of the stout fresh complexioned youths whom Voltaire admired," and so forth. Comment on folly of this kind is hardly required, and indeed it is not probable that any one foolish enough to commit it would understand the way in which other people regard it. It would be venial, however, if this were the only way in which Mr. Parton goes out of his way to catch the ear of his own particular audience. "It is difficult," he says, "for an American citizen to realize the fond anxiety with which the French people watched the growth and listened to bulletins of the health of this little boy" (Louis XV.) An American citizen must in that case be a very dull person, and Mr. Parton may be assured that it is perfectly possible for an Englishman, notwithstanding an exactly parallel difference, to realize the fond anxiety with which Americans have lately been listening to bulletins of the health of President Garfield. Elsewhere Mr. Parton must needs drag in "inflation." Law, of course, comes in for some terribly strong language, language which goes far to show that Mr. Parton has a very indistinct notion of what Law actually did. Gürtz, he tells us, again, "was the only person who ever suffered death for the pernicious error of inflating a country's currency." What does it matter, we should like to know, to the readers of a biography of Voltaire whether the biographer is for "hard" money or for "soft"?

Mr. Parton's general critical standpoint as to his hero is hardly more satisfactory than his attitude in regard to these details. To him Voltaire is not what he is to sober critics, a literary figure of the very first, or all but the very last, importance; a significant landmark in the history of social and religious opinion; a personality, questionable indeed, but on the whole rather attractive than the reverse; a politician almost unimportant. M. Victor Hugo's discourse on the Voltaire centenary, in which that great writer showed himself at his very worst and weakest, seems to Mr. Parton "the crowning utterance of the century"; it is "the highest effort of the kind in French literature"; Béranger's "Baptism of Voltaire" (as poor a thing for Béranger as the speech just mentioned for Hugo) "will be a fresh possession to each generation after the trivial episode of the Restoration has been generally forgotten." The reason of these extravagant estimates is sufficiently clear. It is not respect for Béranger or for Hugo, but for Voltaire, which induces Mr. Parton to make them. He has accepted to the full, and exaggerated not a little, the view of those who see in Voltaire's "*écoutez l'infini*" the watchword of modern Europe. He would fain, if he could, make of the patriarch, not merely a great religious, but a great political, reformer, though in his character of American citizen he has readily to confess that it was very wicked of Voltaire to speak of the lower classes as *canaille*. That Voltaire had no definite political views at all, or, if he had any, would have liked a thoroughly enlightened and amiable despotism; that his religious, or anti-religious, crusade resolved itself partly into mere mocking, partly into a carrying out, not altogether according to knowledge, of English ideas as to toleration, Mr. Parton seems not to have the slightest idea. The Revolution itself might have taught him better. It was very far, and is very far, from seeing an ally in Voltaire; and the sole reason for the revival of affection for him in the France of to-day apparently is that to the French Radical of the moment anybody who ever annoyed the Clericals is a saint.

In point of critical grasp, therefore, Mr. Parton's book is as destitute of value as it is in point of literary execution. The translations in which it abounds are extremely ill executed, the ignorance of French idiom, or else the incapacity to reproduce it in English idiom, which is displayed being portentous. "You will find it impertinent that the same hand should paint the king and me" instead of "you will consider it." "I pretend to be ignored of all the world except you," instead of "I insist upon being ignored by all the world except you," &c. &c. But these

same translations almost make up in matter what they lack in manner. They are, as has been said, very numerous, and they are impartially selected from Voltaire's own letters, from letters to him, and from writings about him. The merely English reader has, therefore, a very considerable body of first-hand evidence from which to judge Voltaire. Moreover, the narrative which connects these extracts is very copious, very minute, and on matters of great importance tolerably accurate. Every now and then, indeed, the remarkable faculty which supplies the place of the judicial faculty in Mr. Parton's case makes itself apparent, as in his odd acceptance of a solution of the *vacatissima* *questio* of the name Voltaire, for which he has, or at least produces, no other authority than a quotation in the English *Pall Mall Budget* from the French sporting newspaper *Le Derby*. Of the actual facts of Voltaire's strange and busy career, however, a very full, and on the whole sufficient, account has been got together in these voluminous pages. Every praise that may be due to diligent compilation fairly belongs to Mr. Parton. It has, indeed, not been necessary for him to do more than to take the trouble of reading a certain number of very accessible books. But the number was considerable, and the trouble is one which, unfortunately, as every week shows us, a very large number of authors altogether disdain to undergo. It was perhaps more than it is fair to expect from human nature that he should have refrained from spicing the results of his investigations with the flowers and sprouts of his own brain. Mr. Parton no doubt thinks that to say "it savoured of good breeding to be Cartesian—the last resource of error that has received its death wound" is rather neat, and perhaps the citizens of a free and not over-polished Republic like to be told that good breeding is the last resource of error. He may be of opinion that "Voltaire's empty sarcophagus speaks more powerfully than if it were a Tamerlane's pyramid of bones" is a vigorous picture and an appropriate image. Perhaps it is not too much to allow him these innocent exaltations in consideration of the good solid work which he has actually done.

No one who has hitherto derived his ideas of Voltaire's visit to Frederick merely from Mr. Carlyle and Lord Macaulay should omit to correct them by the account here given—one of the most careful parts of the book. So, too, the account of the Cirey stay is very interesting, and much the fullest that we know in English. Indeed, a full one was hardly possible before the publication of that part of M. Desnoiresteres's work which deals with the subject. Voltaire's bondage to his Marquise is very well exhibited, though it is fair to remember that the witness most damaging to the fair Emilie was a lady (Mme. de Gragny), who admits that her hostess treated her very badly, and who seems to have been a very little jealous of her influence over Voltaire. The last part of the story, that relating to Ferney and Les Délices, is less elaborately treated; but as this is also one of the best known, and as the various visits to Voltaire of Burney, Moore, Casanova, &c., are public property, there was perhaps less need for minuteness here. On the other hand, the youth of Voltaire and his last visit to Paris come in for very elaborate treatment, and, as far as the information given is concerned, very little is left to be desired in connexion with them.

On the whole, then, this is one of the very few books of which it can *not* be said that the picture would have been better if the painter had taken more pains. Mr. Parton's mere diligence is fully satisfactory and sufficient. It is his art that is in default. Indeed, if he had tried to do a little less, and avoided all attempts at doing anything but setting forward the facts, without comment, criticism, or view of his own, he would have done a great deal better. But in that case he would have been a rather superhuman person. And it is, perhaps, on the whole, unreasonable to find fault with a human being for not being superhuman.

#### THE VIOLIN AND ITS MUSIC.\*

IF there is any musical instrument which deserves to have its history written, and read, not once but many times, it is the violin; for even the general public might well afford to know something about one of the most wonderful and perfect inventions of men. The pianoforte is, of course, the most familiar, the most useful, and to some people, for these very reasons, the most obnoxious of instruments. The organ is supremely impressive, but it is not delicately expressive; it is the most romantic of instruments, and has a long history, but it is too easily profaned; and, as it supplies the greatest amount of noise at the least expense of mental or muscular labour, it meets more often with profanation than respect. The violin is not so easily profaned. A layman can do nothing with it at all; it is a speech which is hard to learn and hard to keep, even in a moderate degree, so that it is much more sacred to the initiated in the most intimate musical mysteries than are its larger brothers. But, most of all, it is the most perfect means of musical utterance which has ever been devised. Its resources of expression are almost without limit, both in kind and extent and in degree. A man can express passion and tenderness, wisdom or humour, grandeur or delicacy, on a small or a large scale, without subterfuge and without compromise; and he can do it without the complicated machinery of bellows and trackers and stops, or the labour of lungs or pinching of lips and the elaborate mechanism to let out the right sound in the right place, or

the marvellous delicacy of pianoforte action. With his own fingers alone he stops a few strings just where he will, and with his bow, guided by his own well-trained muscles, he makes the sound for himself. All complicated machinery lies between the man and his musical speech, and shuts him off further from spontaneity, but the violin lies close to a man's soul, and with it he can tell the most intimate things of his nature to those that have ears to hear.

It is rather a proof of the nobility of the instrument and the smallness of the average man that great violinists should be so rare. If we take our own country, for instance, it seems rather a strange matter for reflection in relation to music and men's musical powers that it has not produced a single great violinist of the first rank. Italy, France, Germany, and even little Belgium, have their great names, and a fair row of them; England has not one, and few even of such free and able spirits as can do their duty by it. However, it is not yet too late, and there may be improvement; and, moreover, though mankind as a rule think little of things they do not themselves excel in, it may be confessed without vanity that there has generally been a small nucleus of people in this country who know what music is at its best, and appreciate in others gifts which are denied to themselves. This is a very honest trait, and it is one to be encouraged; and Mr. George Hart is quite right to give them the opportunity of improving their information and increasing the numbers in so worthy a circle by putting forth a large and attractive volume on what he is no more than reasonable in calling the king of instruments. It is difficult to think of a man whose position would better fit him for the work; and the broad range of interest in the book which appears at the very beginning, and the evident appreciation of the romantic as well as the practical side of the question, shows that the man is not merged in the specialist, and that outsiders as well as experts may look to find amusement as well as instruction therein. The range of the book is of the widest, and the author endeavours rather fruitlessly to dive into the obscurity of the middle ages for the springs and sources of his subject. He takes up with the view of Roger North as to the viol when he says, "I cannot but esteem it perfectly Gothic." A considerable space is devoted to this point, though there are but dim glimmerings of inference to guide the devious way. The Troubadours of Provence had something to do with the viol, and so had the Violas of Spain, and yet more the Meistersingers of Nuremberg and the other great German towns. But this does not help much to a judgment. Moreover, the viol was not the direct ancestor of the violin, nor was the treble viol its counterpart. These were larger and coarser, and differed somewhat radically in shape, and were fretted on the finger-board. The direct ancestor or prototype of the violin was rather the instrument called by Anglo-Saxons *fithle*, or *rebec* by the French, and *geige* by the Germans; and its existence went on for a long while side by side with the viol, but in different company. The viols were the instruments of polite society, and the fiddles of the vulgar. The latter were at home in the fairs and the taverns, and the former in the houses of the then intelligent classes. Many people believe the rebec to have come from the East, and some authorities go so far as to say it is the common ancestor of both viol and violin. The sculptures of ancient cathedrals and minsters and the vignettes and borders of manuscripts may throw some light on the question; but it cannot be hoped that so obscure a matter will ever have a decided solution. The particular view held by the author is not likely to gain strength by his saying, "Though I have named the Goths as the possessors of a bowed instrument which gave rise to the viol, I have done so for the sake of simplicity rather than from conviction." So that, on the whole, it will seem agreeable to a logical mind to get on to more stable ground.

It is certain that a book by Carmine Angurelli, published at Verona in 1491, contains a woodcut of a seven-stringed viol of somewhat rude construction, and that German paintings of nearly the same epoch, or a little later, contain representations of similar but rather better constructed instruments. This, however, may not count for much in respect of the superiority of one nation over the other as far as regards the instruments, for the Germans may have had the more accurate powers of observation. The chief point which is certain is their general diffusion and development. The improvement of instruments and of the music written for them generally goes hand in hand; they act and react upon one another. While these stringed instruments were without bridges to support the strings, or had only flat bridges, and no hollows in the sides to enable the bow to get to the outside strings, it is obvious that little real musical work could be done with them. When and how a better state of things was attained cannot now be ascertained; it is only clear that by this period—about the end of the fifteenth century—viols must have reached sufficient development to be available for real music, though their tone cannot have been at all remarkable, or near in beauty to that of a violin.

The beginnings of polite instrumental music were almost certainly from vocal madrigals, which were the earliest forms of domestic music. Vocal music, of course, was the branch which was earliest cultivated, because the voice was the organ which nature had given to man ready to his will. The early masters of the Netherlands brought this art of writing for voices up to a very high point, and carried their powers with them to Italy, where many were engaged in high musical offices by Popes and nobles. When this vocal writing became very elaborate, viols were introduced to assist the voices and keep them

together. Then, for variety's sake, the voices were sometimes dropped and the viols played alone. The step from this is not far to compositions exclusively for viols. Of this emancipation Andrea Gabrieli and his nephew Giovanni are sometimes credited with being the heroes. They were both in highest musical authority at St. Mark's, in Venice, and the former was the pupil of the great Dutchman, Adrian Willaerts, who occupied the same post before him. "Sonate a cinque per i stromenti," by Andrea, were published at Venice in 1586; and the nephew Giovanni is credited with being the first to use violins in a dignified position, namely, in his "In Excelsis" for soli and chorus, with orchestra of violins, horns, and trombones. It is, however, certain that works for instruments alone were published in France before this, though they may not be held to be sufficiently dignified to take precedence. A book was published, in Paris, by Attaignant, from 1547 to 1555, which contains galliades and pavanes and other dances for viols in four and five parts; and if such things do not appear as important in themselves as the madrigals played on the viola, they had, in fact, quite as much share in the parentage of sonatas and quartets and symphonies. It must be just noticed in passing that the spread of printing had not a little to do with the development of music. Petrucci began printing music in Italy in 1495, and Wynkyn de Worde in England in 1530, and very little later the musical world was most wonderfully alive and taking giant strides of progress.

Till the latter part of the sixteenth century the viols still held possession of the field, but Gaspar di Salo was making violins in 1560, and time had already come round to the famous family of Amati, who began with making viols, but very soon after attained the highest possible perfection in the art of making violins in the beginning of the next century; which also was to see the appearance of Antonio Stradivarius, whose violins in these days are canonized by the familiar name of Strads. The music for the instrument cannot in this case be said to have kept pace with such a rapid blaze of achievement. So far progress was tentative and slow, and was as usual hindered by the dulness of perception of executants and auditors. Monteverde, among many other experiments which we now take as a matter of course, tried some new effects with his strings which so alarmed his players that they at first refused to try them. He used violins in his opera *Orfeo*, which was played at Mantua in 1607, but the fretted viol was not yet by any means driven from the field. A considerable amount of good music was written for it after this date, and it may be a little comforting to know that some worthy work of the kind was done in this country; as for instance by our Orlando Gibbons, in the "Fantasias of three parts," which the author has either forgotten or preferred not to mention. At all events, they have some extremely fine points in them, and if we could do anything relatively as good nowadays we might be very well contented with ourselves.

The violin must have been for some time creeping up and gaining on the viol, but the final victory was reserved, historically, for Corelli. His opera prima, called "Sonate di Chiesa a tre, due Violini e Violone eccet.," was published in Rome in 1681, and this and the works which shortly followed clinched the matter. But some honour should be reserved for the violin-makers, and for the nameless sons of art whose labours were the foundation upon which Corelli built, or gathered and bound into perfect and convincing order. The author discusses some anecdotes about him, given both by detractors and encomiasts, and rightly points out the unsatisfactory nature of such personalities. The most satisfactory item quoted is the account of his ideas on the ensemble of a string band; this is given by his pupil Geminiani, who reported that he "regarded it as essential to the ensemble of a band that their bows should all move exactly together, all up or all down; so that at his rehearsals, which constantly preceded every public performance of his concertos, he would immediately stop the band if he discovered one irregular bow." This will remind some readers of the practice of the Paris Conservatoire. Corelli's solos appeared about 1700, and in 1701 Scarlatti wrote his opera *L'odiouso e l'avernice*, in which there is an obligato violin accompaniment to an air, and his orchestra contained violins, tenors, cellos, and basses. The steps here go quickly in the direction of things as we know them familiarly. Porpora was Scarlatti's pupil, and Haydn was Porpora's. But, while the world was getting ready for the artistic achievements of Haydn, it was tolerably well occupied with such remarkable men as Veracini, Tartini, and Nardini in Italy, and Le Clair and Gaviniés in France, and with such giants in composition as Bach and Handel. The worst of this state of things for the general reader is that, in order to approach to anything like sufficiency and completeness with such a crowd of witnesses as there then were, many pages degenerate into mere lists of names and references to compositions. The author puts in a plum here and there to keep the interest alive, but it is hard to trim the balance. As Halifax says, "Resolving to serve well, and at the same time resolving to please, is generally resolving to do what is not to be done." But, at all events, there is a great deal of information in the book about the early stages of violin history and the earlier violinists; and, if the great masters have not a due proportion of space left for them, it may, at all events, be said that it is easier for the public to get their own information about them and to hear their works if they will. To an exacting critic, however, the author will not appear to be so perfectly at home or so thoroughly interested in general matters of musical information in the later and grandest period of art; and his information, though undoubtedly rich, is not complete. It is rather

curious, for instance, to find him writing of John Sebastian Bach that, "had he possessed the quality of ambition, perhaps the world might have been richer in masterpieces"; and, further on, if he could have commanded an orchestra, "his cantatas and large works might have been quadrupled in number." As Bach wrote a Grand Mass of the largest dimensions, four small ones, five Passions, five Sanctus, the Christmas Oratorio, two Magnificats, and a good deal over two hundred Cantatas, besides a colossal pile of instrumental music, a reasonable man might very well be satisfied, and quadrupling would seem, perhaps, a little superfluous. In another place he speaks of Clementi as a writer of nocturnes, and the notice he makes of Schubert is very inadequate, as he goes to Mr. Chorley for criticism, and makes no mention of some of his finest works which belong to the subject of the violin. Moreover, the consideration he gives to the great John Sebastian is quite inadequate to his importance in relation to the violin, and the list of compositions for the instrument appears to be incomplete. It may be said, as a set-off, that there are some excellent remarks about the position of Philip Emanuel Bach in relation to music generally which could not come from a man who had not a remarkable range of knowledge apart from his special subject, and there are criticisms and remarks on general subjects throughout the work which are of the same calibre.

Haydn, Mozart, and Beethoven offer subjects too large to be brought easily within the range of a history of the violin; but there is a good deal set down which is of general interest, if not a little too general. All three did something themselves in the way of playing stringed instruments, but naturally not in a manner to make much impression on the history of technique. From the violinist's point of view, pure and simple, Viotti is more of a great landmark. With him, the writer says, began the modern school of the violin. He was born in Piedmont, in 1753, and an important part of his life was spent in Paris, where he had the opportunity of influencing several very remarkable players of his time. Among these was Pierre Baillot, who is said to have taken his style as the ideal of perfection and to have modelled his own therefrom. Baillot was himself a pupil of Nardini, who was a pupil of Tartini. Tartini in his turn is looked upon as a follower of Veracini, whom he undoubtedly surpassed, and Veracini was a pupil of Corelli. This brings an interesting genealogy very near to our own time. In another line the famous violinist Rode was a pupil of Viotti, and the admiration which Spohr had for Rode caused him to become, in his own estimation, his most faithful imitator. In this manner Rode, through Spohr, influenced the greater part of contemporary violin playing; and Ferdinand David, the friend of Mendelssohn and Joachim, was the pupil of Spohr.

The writer holds that the position Spohr occupied in relation to the progress of the violin was hardly less important than that of Corelli. He effected "the union of Italian, French, and German art." "The style of composition which Spohr brought to bear upon the violin as a solo instrument necessitated a special education on the part of the executant." The conclusion from which is, that "something more is needed than correct time keeping and perfect mechanism; in short, that the painter must ally himself with the poet," &c. This is large-minded and true in general, and possibly of Spohr in part; but there were men of the right stamp before Agamemnon, and other influences may have had more to do with the development than the great German violinist is accountable for. Men had to learn to express what the greatest composers provided for them, and in relation to every instrument this has more influence than commonly appears.

There is a very great deal more which is well worth discussing in the book if it were possible; such as the account of that phenomenal prince of virtuosi, Paganini, and his musical genealogy, and the estimate of his position in relation to genuine art; and there are anecdotes about great musicians and their works, some of which are a little garrulous and some of no little interest and illustrative value; but people who have time for anything reasonable may not find it amiss to look for them themselves. It is probably not possible to fit amusement with the completeness of a work of reference, but so far as such things are compatible in relation to a very rich subject, the writer has made an admirable effort.

#### OLD ALI.\*

THE title of this work is somewhat fantastic. A tour which took place in 1860 can scarcely be classed with propriety among "travels long ago." And the Persian servant whose name Mr. Osmaston tells us he feels a pleasure in bringing "conspicuously forward" on his title-page was, in reality, not called Ali, but Agha Baba. But these are details of small importance. The principal fault to be found with the book is that the information it contains is, if not absolutely stale, at all events deficient in freshness. Had it been published immediately after the traveller's return home, it would perhaps have inspired a lively instead of a languid interest. After the lapse of a score of years there might seem, at first sight, to be no sufficient reason for its appearance now. But the author takes care to inform us that he has had special reasons for publishing now his long-suppressed notes of travel. He fears, though he finds it hard to believe, that there exist "Englishmen of the present day, in the year of grace 1880,

so unenlightened as would join our Church of England to such a painted charnel-house" as the "so-called Greek or Russian Church." And therefore he is glad to testify, "at the present time more especially, to the gross ignorance and lamentable superstition, the outcome of priestly rule," which are linked with the ceremonies of that Church, as witnessed by him on half-a-dozen occasions during a six-weeks' tour in Russia. It has also been his "pleasant duty," his preface proceeds to state, to record "some marked Providences"—that is to say, several evident interpositions of Providence in his behalf. These do not seem to have begun to manifest themselves while he was in Protestant Scandinavia. But during his progress through superstitious Russia and infidel Persia they were as frequent as valuable. His meeting with an English companion on his way to Astrachan was "a Providential over-ruling." When his departure from Astrachan was facilitated by the abrogation of one of the laws which used to hamper the movements of travellers, he "most strongly" felt that the change was "a marked Providential occurrence"; and the present of a work on Persian travel which he had previously been unable to obtain was, in his eyes, "another link in a Providential chain." A vigorous faith of this kind naturally carried him cheerfully through many difficulties and some dangers. On several occasions his capacity for believing lent a pleasant enchantment to the views on which he gazed. When he saw the supposed tomb of the Prophet Ezekiel, it occurred to him that, "though two thousand five hundred years have nearly run off the roll of time since that great prophet's day, still there is no reason for believing that this is not the hallowed spot where he lies buried"; and when he was shown "a most ancient copy of the Book of Ezekiel," he rejoiced to think that it was "possibly the very one inscribed by the great prophet himself." After remarking that Aleppo is the Zolah of the Bible, formerly ruled by the Haddadezer whom David overcame, he adds:—"A striking verification of this was found some time ago in an old Hebrew inscription on stone, discovered somewhere near the castle in Aleppo, which recorded 'that Joab, the son of Zeruiah, the general of the great King David, came and took this city in battle from the King Haddadezer.'" On linguistic questions he does not often record an opinion. But we are told at p. 326 that "it is remarkable how very many Persian words correspond in sound to our own; and it is evident that both the Saxon and the Celtic are largely derived from this Persian source." He found that many of those words had "a most unmistakable Saxon ring in them"; among others, the equivalents for "orange" and "balcony."

Mr. Osmaston's book is readable throughout, his descriptions are often picturesque, and his remarks on what he saw are usually sensible. But so much has been written since he travelled about most of the regions through which he passed, that there is little in the first half of his volume which has not been already rendered sufficiently familiar. While in Norway he witnessed a fire at Christiania, and on the way to Drontheim a flood compelled him to turn out of his railway carriage and take refuge on board a steamer. He visited the North Cape, but was prevented by mist from seeing from its summit the midsummer midnight sun. He went to church at Hammerfest, and was on the whole edified by the service, though he was surprised to see the minister put on over his surplice "a crimson cloth, which hung down in a peak behind, and having a large golden cross worked upon it, looking, I must own, very Popish-like." With the Norwegians he was much pleased, though they were too lazy ever to run, and they smoked and spat in an annoying manner; and by the Swedes and their country he appears to have been favourably impressed. On his description of St. Petersburg it is unnecessary to dwell. "Why we English saint it (he says), I don't know; the Russians give it no title, calling it simply Petersburg." This is a mistake, but a natural one. The *Senkt* really forms a part of the name of the city, which was called after the saint and Apostle, not the Tsar, though it is colloquially suppressed.

The story told to Mr. Osmaston by a Russian friend about the preparations to fire the city made by the authorities during the Crimean war, may be set down as one of the tales concocted for the benefit of travellers. "He assured me that Petersburg was considered to be so defenceless and unprotected at that time, while our sailors were sporting themselves in the Baltic, that immense piles of faggots were laid up in the corners of the chief streets in order to commit the city to the flames sooner than that the hand of the spoiler should touch it. 'As we did to Moscow, so we would have done to Petersburg,' he said." In travelling in Russia Mr. Osmaston met with no difficulties. While still at St. Petersburg he took the singular step of turning all his paper money into gold, which he secured in a leather girdle, fastened night and day round his waist. The sight of his gold must have created a sensation in a land but little familiar with the aspect of that metal except on gilded domes and other ecclesiastical ornaments. The necessary expenses attendant on Russian travel he found moderate, in spite of the absurd stories to the contrary in which some imaginative tourists delight. At Moscow he visited the usual palaces and churches, marvelled at the wonder-working pictures above the Kremlin gates, drove to the Sparrow Hills, and looked down upon "the city, with its domes and towers and spires glittering in the broad and luxuriant plain, and the river Moskowa meandering slowly through, often lost in the overhanging trees and behind the wide sweeps of green"; and boldly made his way to the front during a great review in presence of the Emperor himself, whom he describes as "a man only, after all,

\* *Old Ali; or, Travels Long Ago.* By John Osmaston. London: Hatchards.

and no more—a middle-aged, well-proportioned man, handsome, even delicate, in feature, wearing a dark, curling moustache, and no beard." He also made his way into a nunnery. The two inmates whom he saw were elderly, so he wrote in his diary:—"This sex, it seems, generally begin to renounce the world and its vanities just when the world renounces them, and to take the vows of eternal virginity, when all chance of entrapping a partner for life has fled away"; an over-hasty generalization. The description of the drive from Moscow to Nijny Novgorod is rendered interesting by the fact that it records a state of things now passed away. At present the traveller glides comfortably along by rail; but Mr. Osmaston by no means enjoyed his journey, the jolting being terrible, "like the rocking of a ship at sea," no sleep being procurable in the floundering vehicle, and no food in the miserable, mud-surrounded posting-houses. From Nijny Mr. Osmaston sailed down the Volga to Astrachan, and thence across the Caspian to Baku. There is nothing remarkable in his description of this part of his journey, except his assertion that Calmucks have "an extraordinary reverence for cats," and that during Napoleon's invasion of Russia, "the French dreaded none more than these hordes of Calmuck barbarians," on account of their great skill in archery. Whoever told him this must have been himself an adept at drawing the long bow.

Passing from Russian to Persian soil, Mr. Osmaston made his way as far as Teheran, where he engaged the "Old Ali," after whom his book is named. On his way home he visited Bagdad, inspected the ruins of Nineveh, and made the acquaintance of the Protestant missionaries at Aleppo and Antioch. His account of the Christian community at Aintab is interesting. It is the custom at Aleppo, he says, for the peasants who bring in food from the country to pay toll at the gate, and their baskets are rigorously examined, however much they may protest that they are not introducing provisions. There is only one exception to the rule. "If the man is a Protestant from Aintab, and declares himself to be such—is known to be one—he goes on without search on the integrity of his word." Mr. Osmaston says, "I am very thankful that I was led to visit this place, and to witness with my own eyes the power of a heartfelt Christianity in the midst of darkness and superstition." But he does not aver that he stood at the gate and saw with his own eyes an Aintab Christian passing in with baskets unsearched on the strength of an affirmation. With the Nestorian Christians he naturally felt much sympathy, especially as he was assured by Mr. Rassam that they had no doubts about their being the descendants of Israel. Mr. Rassam "believed himself to be of the tribe of Ephraim; but affirmed that no Israelite now can possibly be certain of his tribe, for that there was not a man living who had his pedigree of descent—all was tradition, everything having been lost or destroyed." In the belief that the Nestorians are "a remnant of the 'lost' ten tribes" Mr. Osmaston is inclined to acquiesce. "But why called always 'lost' [he says] I do not know, or why they should have been searched for in so many unlikely places, for it would be most probable to find them, surely, where they were first taken, which was into those very mountainous and adjacent countries where they were placed by Shalmanezzer, the King of Assyria, when they were taken captive." In spite, however, of his readiness to believe anything in the Nestorians' favour, and the fact that their form of worship is simple, he fears that "there is little real spiritual life among them."

#### PAR PALIMPSESTORUM DUBLINENSIMUM.\*

THE *Codex Rescriptus Dublinensis* is known by name to every critic and almost to every student of the criticism of the text of the Greek Testament, although it has not been mentioned in Mr. Hammond's useful little work on the subject. It has been described in Mr. Hartwell Horne's *Introduction to the Scriptures*, and more recently by Dr. Scrivener in his *Plain Introduction to the Criticism of the New Testament*. It was discovered in 1787 by Dr. Barrett, who published a copy of it with the Greek characters tolerably well imitated, the pages and the lines corresponding with those of the original in a quarto volume in 1801. The present, which is modestly spoken of as "a new edition revised and augmented," has not been printed because there was any demand for the earlier edition, which for all practical purposes has been superseded by the collation of it with the original in 1854 by Dr. Tregelles, and by the text, with Dr. Tregelles's collations, edited by Mr. Hansell at Oxford in 1864. The additions made by Dr. Tregelles were but few, as may be seen by the page in the appendix to Mr. Hansell's work, where they are printed in red ink. The edition by Dr. Barrett had, as might be expected, several errors; but, considering the extreme difficulty of reading the palimpsest, we quite agree with Dr. Scrivener and Mr. Abbott that the comments on its inaccuracies have been unnecessarily severe. Mr. Abbott considers that he has discovered about four hundred letters and marks which

have escaped the notice even of Dr. Tregelles. We have compared the two collations, and find a considerable number of additions of letters and half letters, whilst here and there a letter has been omitted, which we suppose Dr. Barrett printed from carelessness; and if we may judge from the facsimile page that is given in this volume, it is much to be wondered at that the text was printed as correctly as it was.

We must confess that we do not see the advantage of printing a book with letters which are cast to resemble the average shape of the letters of the MS. We should have been quite content to have the lines and the pages preserved as they are in the original, and printed in ordinary Greek characters. And there was the less occasion to reprint what is called a facsimile, because Dr. Barrett had already done it. But we protest against the term "facsimile" as applied to such productions by Dr. Scrivener and others. Mr. Abbott has, however, not used the term, except as applying it to his two plates, which are real facsimiles.

The MS. itself is in uncials, and contains 290 verses of St. Matthew's Gospel, and is of the fifth, or possibly as late as the sixth, century. It consists of 32 leaves, written in beautiful round and square uncials, and, what is most important to our present purpose, has very few mistakes. Mr. Barrett has carefully examined it, and detects about 25 errors—nearly all of them of the kind called *Itacism*—and one omission of two letters of the class *homocoteleuton*; *ov* being omitted between *χρῶν* and *ἡμετέρας*. This, however, can be allowed little weight in defining the critical value of the Codex, which must be estimated by its agreement with the other principal authorities for the text of St. Matthew's Gospel. But the fact that there is only one such certain careless omission, while there are no repetitions of words, will have some weight in determining that omissions of whole words, when they occur, are by design and not by carelessness. Unfortunately it has only 23 verses in common with the Alexandrian MS., but in the short space common to it and (Z) our MS. there are 14 differences, whilst the variations from the Sinaitic are only 7 in number, and those from the Vatican 11; a comparison which falls in very accurately with what we had expected from reading it in conjunction with the *Textus Receptus* and the early uncials. Mr. Abbott has counted the variations in 26 pages, and, having taken so much trouble, it is to be regretted that he did not take a little more, and examine the whole 64 pages for the same purpose. However, it would probably not have altered the proportion of the figures by which he establishes that (Z) closely resembles the most ancient codices, differing from the Sinaitic MS. in only 30 places, and from the Vatican in 44, while its variations from the text of Stephens are 95. There are 13 readings enumerated by Mr. Abbott in which it stands alone; but the greater part of these appear to be due to the carelessness of the scribe, and ought to be counted amongst the errors we were mentioning just now, and do not affect our judgment of the critical value of the Codex. Besides this, there are 8 readings in which it agrees with one or more of the cursives, unsupported by any other uncial. These last are too few to found any argument upon; but the rest of the analysis seems to us to afford good ground for argument both as to the value of the text of the MS. and also as to the comparative value of the Sinaitic and the Vatican Codices when estimated separately, as well as the value of their united testimony. We shall take it for granted, without troubling our readers with any induction of particulars, that this is really one of the most ancient MSS. existing, and also, independently of its antiquity, one of the most valuable. We have compared its testimony with the text which would be pronounced almost certainly right from a comparison of the most ancient documents, and it gives its suffrage in favour of such text about forty times, and very rarely against it. But, though this would go far to prove the value of the MS., it might perhaps be said to militate against its utility, as the same text would have been produced with or without its testimony. And its utility must of course be judged by the aid it gives in more doubtful cases. We have only counted cases in which the Sinaitic and the Vatican texts agree, and are supported by at least one other uncial and considerable independent testimony.

But it seems to us that there is another kind of value belonging to the MS. which is quite independent of the contributions it has directly made towards producing a correct text of St. Matthew's Gospel. If the general correctness of its text be conceded, independently of mere errors of copying or omission, it ought to be judged a competent witness as to the comparative value of the other ancient codices, with which it is sometimes in agreement and sometimes not. Few will be disposed to deny that the Sinaitic and the Vatican MSS. are the two most valuable known. But issue is joined as to their comparative value, and also as to the weight of their combined testimony when they agree. Thus Tischendorf is accused, and perhaps with some reason, by Dr. Scrivener of an excessive and irrational deference to the Sinaitic, and of course it was likely beforehand that he would be prejudiced in favour of a MS. which he must regard as his own child, as he was its discoverer. "The evidence of Cod. *Δ*, supported or even unsupported by one or two authorities of any description, is with him sufficient to outweigh all other witnesses, whether manuscript versions or ecclesiastical writers." On the other hand, he quotes on the very same page from another writer a eulogium of the Vatican manuscript which we transcribe:—

Seeing that the Vatican manuscript does not contain one single passage that can be demonstrated to be spurious, or that by the evidence of other manuscripts and of the context admits of just doubt as to its

\* *Par Palimpsestorum Dublinensium: the Codex Rescriptus Dublinensis of St. Matthew's Gospel (Z)*. First published by Dr. Barrett in 1801. A New Edition, revised and augmented; also Fragments of the Book of Isaiah in the LXX. Version, from an ancient Palimpsest, now first published. Together with a new discovered Fragment of the Codex Palatinus. By J. K. Abbott, D.D., Fellow of Trinity College and Professor of Biblical Greek in the University of Dublin. With two Plates of Facsimiles. Dublin: Hodges, Foster, & Figgis. London: Longmans & Co. 1880.

authenticity, a position that no other manuscript enjoys, man is bound to accept the testimony of that manuscript alone as his present text of the sacred record wherever he possesses its teaching.

So extravagant a statement could scarcely be deemed worthy of the elaborate refutation with which Dr. Scrivener has condescended to honour it. But though Tischendorf's deference to the Sinaitic MS. appears to us somewhat exaggerated, we have always been of opinion that this was the more valuable of the two. We wish Mr. Abbott had extended his analysis of the differences of (Z) from M, B, C, L, and Stephens's text to the whole of the document, but we are content to take his figures as he gives them for the twenty-six pages he has professed to examine for this purpose; and on the supposition that this MS. is of first-rate value, it certainly gives its suffrage in favour of the Sinaitic as against the Vatican and the Vatican against the Alexandrian. And this conclusion is further strengthened by the acknowledged fact that, as far as the Gospels are concerned, the Alexandrian MS. is decidedly inferior to the other two. The value of this argument may be very variously estimated; but no one, we think, will deny that it has some force, and that it establishes at least a slight probability in favour of those who lay more stress on the Sinaitic than on the Vatican text. This conclusion is still further fortified by the fact, which Mr. Abbott also mentions, that in a few instances Z agrees with the Sinaitic alone of uncials, but that in no instance does it agree with the Vatican alone.

And now what light does the text of Z throw upon the value of the combination of (M) and (B)? Here we have nothing to guide us in Mr. Abbott's remarks beyond the single observation that it agrees with both of them against the remaining uncials in at least ten instances. But we observe that in most of the places we have noticed in which it lends its support to the Sinaitic and the Vatican combined it is confirmed by (C), and very often by (D); more often indeed by (D) than by (C); but then it must be remembered that (C) is frequently deficient in passages which are found in (D). Now the very general resemblance of the Sinaitic and the Vatican manuscripts is such as to render their joint testimony of less value than the conjoint testimony of either of them with the Alexandrian—as being more nearly akin to each other. But the fact that this MS. so often agrees with them when they agree together does away, to a certain extent, with the suspicion that attaches to their agreement, and must therefore be allowed some weight in increasing our estimate of the value of each of those manuscripts separately.

Of course it may be said to be something like arguing in a circle to establish the value of a more recent document by reference to documents older than itself, and then to prove that these manuscripts are of great value because they agree with the more modern one. Nevertheless we submit that the considerations we have adduced establish to some degree of probability that the Sinaitic is more trustworthy than the Vatican manuscript, and that their combined testimony is of greater value than we should naturally have supposed if we had not had this manuscript to compare them with.

The great interest of the subject has kept us from noticing the particular edition of the MS. which we are reviewing; but it is only justice to Mr. Abbott to say that our argument, whatever it may be worth, has been mainly derived from the facts detailed in the editor's exhaustive analysis of the document. To this it must be added that the volume is beautifully executed, and though we do not ourselves consider it worth while to produce an imitation which is not an absolute facsimile, in the absence of this latter we cannot affect to regret either the labour, the time, or the expense bestowed upon the production. Short of its not being a photographed copy of the original manuscript, the work leaves nothing to be desired; and we may observe also that, in order to produce a more exact copy, several letters appear to have been cast in two or three different forms.

Of the other fragment which appears in the volume we shall only express our regret that the four leaves of which it consists should have been thus connected with the celebrated Dublin palimpsest. The same remark seems to apply to the last leaf of the volume, which consists of a beautiful facsimile of a missing leaf of the Codex Palatinus, containing the passage from Matt. xiii. 13-24, purchased by Dr. Todd some time before the year 1847. But we shall only say of this that, as it is part of St. Matthew's Gospel, it is more in point to the present subject than the few fragments of the prophet Isaiah, which have only this in common with the palimpsest, that they are found in the same library and the same volume, and are probably nearly of the same date.

Of the labour bestowed on the manuscript and its results the following is the editor's modest description—

If I have succeeded beyond what could have been expected in discovering letters and marks which escaped Dr. Tregelles (over 400), it is because being resident in Trinity College I was enabled literally *nocturna versare uana, versare diurna* this important Codex. It has often been only after repeated examination in different lights that the existence of a mark or a letter has been placed beyond all doubt.

The paragraph lines, which are barely visible, long escaped notice. I had not thought of looking for them until I accidentally detected one (at the top of Tab. xxxix.), which at first I did not understand. It was the same with the marks of quotation.

It can hardly be said that this manuscript has actually turned the scale in favour of any doubtful reading; but there is one passage where it might do so if the editor's conjecture about it is right. In Matt. xiv. 3 the *Textus Receptus* has *ἔδωκεν αὐτὸν καὶ ἄβρο ἐν φυλακῇ*. Now here there are no two of the earlier uncials that are in exact agreement. The editor thinks that the MS. read

*ἔδωκεν αὐτὸν ἐν τῇ φυλακῇ*, which there is no doubt it does, but adds that there is room for the words *καὶ ἀπέβρο* after it and before the following words—*ναῖκα φιλήσπου*. Now, on his own showing that there is either half a line or a line and a half wanting, into which, upon his theory, there has to be got *καὶ ἀπέβρο* διὰ Ἡρακλῆδα τὴν γν—it is plain that, if this is to be got into a line and a half, the lines containing each about eighteen letters, there can be but little preference for *καὶ ἀπέβρο* over *καὶ ἔβρο*. The former, which is the reading of the Sinaitic and Vatican MSS., seems to us the more probable; but we think the editor has overstated the case when he says that these words are cut off, but the space shows that they stood here originally. Upon the whole, the argument appears to be in favour of the reading *ἔδωκεν αὐτὸν καὶ ἐν τῇ φυλακῇ ἀπέβρο*, and if he had stated the reading he has assigned to (Z) as probable instead of certain, we should quite have agreed with him.

#### GERMAN LITERATURE.

THE rise of few great nations will have been so fully related as that of Prussia, should the enormous publication of Frederick the Great's correspondence be ever terminated, and should Herr Droysen be enabled to complete his historical labours. The thirteenth volume of his great political history of Prussia (1) is occupied with the transactions, or rather the negotiations, of less than three years, from the beginning of 1746 to the signature of the Treaty of Aix-la-Chapelle in October 1748. Frederick himself declined to relate the history of this period, on the ground that "political intrigues deserve no attention when they lead to nothing." It does not, indeed, appear that the destiny of Europe was materially affected by anything spoken, written, or transacted during this period, which has nevertheless left a mass of diplomatic memorials behind it, of which Herr Droysen, an historian of the school of Ranke, for whom the histories of Cabinets are the histories of nations, is obliged to take ample note. The most important incident was the conclusion of an alliance between Austria and Russia, with the ultimate object of recovering Silesia from Prussia for the former Power. Frederick knew that his title was merely that of the sword, and that, as an upstart and a despoiler of his neighbour, he could expect little sympathy in Europe. He stood, therefore, on a diplomatic defensive, until the exhaustion of all parties to the European war brought about a general pacification. Frederick's unwearied vigilance is surprising, and his correspondence indicates most forcibly how completely he was the life and soul of his administration. It must also be acknowledged that all we learn here respecting the disposition of the Austrian, Russian, and Saxon Courts confirms the probability that he had substantial reasons when, at a later period, he anticipated his adversaries by beginning the Seven Years' War. The most remarkable episode in the correspondence not directly connected with Frederick is the mysterious tragedy in Sweden, when the English physician Blackwell perished on the scaffold.

The second volume of Prince Bismarck's select speeches (2) comprises those delivered from 1871 to 1877. Although including several upon the Eastern question, the conflict with the Roman Curia, and other interesting topics, there are few, if any, which would have attracted much attention apart from the personality of the speaker. From this point of view they possess a peculiar interest, it may almost be said a peculiar charm. Not including any of the speaker's more recent questionable deliverances on political economy, they represent the mind evidently of a thorough man of business, and of a man of business who feels it unnecessary to affect to be anything else. The speaker's case is invariably well put, but without any special effort to persuade or overawe. The whole tone is that of a plain man talking to plain men, and the absence of rhetoric, the sole reliance on argument, the real or apparent candour and disinterestedness, the superiority to all the ordinary arts of oratory, render them, when it is remembered who the speaker is, more impressive and really persuasive than many much more artistically constructed orations. The absence of anything arrogant or offensive to the speaker's opponents warrants the supposition that editorial care has been exercised in the selection or revision.

Professor Joseph Langen possesses remarkable qualifications as the historian of the early Roman Church (3). He is learned, impartial, a sincere Catholic, but an adversary of the dogma of Papal infallibility. He, therefore, stands apart from the various influences which might otherwise have clouded the judgment of an orthodox historian, whether Protestant or Catholic, and his work seems to attain the standard of impartiality as nearly as can be expected from a writer to whom the subject is one of personal as well as scientific interest. As a critical historian Professor Langen finds it impossible to allow that the Bishop of Rome, during the first ages of the Church, claimed any sort of superiority over other dioceses, further than such a precedence as, in virtue of the importance of his see, is accorded to the Bishop of London among English prelates of the same rank.

(1) *Geschichte der Preussischen Politik*. Von J. G. Droysen. Th. 5. Bd. 3. Leipzig: Veit & Co. London: Williams & Norgate.

(2) *Ausgewählte Reden des Fürsten von Bismarck*. Bd. 2. Berlin: Kortkamp. London: Williams & Norgate.

(3) *Geschichte der Römischen Kirche bis zum Pontifikate Leo's I.* Quellensamml. dargestellt von Dr. Joseph Langen. Bonn: Cohen. London: Williams & Norgate.

There is no trace of any such pretension being systematically maintained until the days of Leo I. at the beginning of the fifth century. With Leo's predecessor, accordingly, Dr. Langen's history of the primitive age terminates, although he half promises to write the annals of the Church's second period. It is to be hoped that this promise may be redeemed. Dr. Langen's pen is guided by the most scrupulous fairness, as he has amply shown in the discussion of episodes so delicate for members of his Church as the department of Popes Zephyrinus and Callistus, Oyprian's part in the Novatianist controversy, and the affair of Pope Liberius.

A work by the late Professor Keim on another department of primitive ecclesiastical history, the conflict between Christianity and Paganism (4), may prove somewhat of a disappointment. Though new to the world, it is not a new book, having apparently been composed as long ago as 1855; while the author's omission to publish or complete it seems to imply that he was not fully satisfied with it. It was intended to have been brought down to the establishment of Christianity, but only reaches the reign of Commodus. Herr Ziegler has, nevertheless, judged rightly in considering it worthy of publication; although many of the most interesting points, such as the nature of Celsus's attack on Christianity and the date of the Epistle of Barnabas, have been more fully treated by the author himself in other places. The most interesting part of the book is the discussion of the various causes which assisted the diffusion of Christianity, such as the intrusion of Oriental religions into the Roman world, the cosmopolitan spirit of administration, the humanitarianism of philosophy, and the reaction towards definite religious faith in the age of the Antonines.

The centenary of the publication of Kant's *Kritik der Reinen Vernunft* will hardly produce a more adequate memorial than Dr. Vaihlinger's (5) ample, but not ponderous, commentary. Besides the explanation of the text itself, Dr. Vaihlinger has brought together a mass of references, showing how Kant has been understood by disciples or opponents, especially contemporaries. His historical introduction and bibliography are also very useful. Dr. Werner's *Kant in Italy* (6) is an account of the reception of Kant's system by the philosophers of that country, which has been rather respectful than cordial.

W. von Reichenau's (7) sketch of the development of Spinoza's philosophy to our times is a prize essay. The writer considers Leibnitz, Kant, and Schopenhauer as legitimate successors of Spinoza, a classification against which they would all three have protested. In our own time, he maintains, their mantle has fallen upon Geiger and Noiré, whose importance many people will think greatly over-estimated by him. It is manifest, at all events, that their method of research differs widely from Spinoza's or Kant's, being almost exclusively the deduction of principles from the actual observation of material phenomena, especially of language.

Herr Meyer's (8) history of the mediæval guild of goldsmiths at Strasburg consists of two dissimilar sections—the "Urkunden," unreadable except by proficient in old German, and the "Darstellung," or summary of the information deduced from them, which is very clear and agreeable. The system of excessive restriction on masters and paternal despotism over journeymen would appear intolerable now, but no doubt answered well in its own day. The fifteenth and the early part of the sixteenth century were the most flourishing period of German industry. About 1540 a reaction set in, attributed by Herr Meyer to the great increase of population, as well as to the political circumstances of the times.

Another volume of the valuable series of works on trade and political economy (9) conducted by Dr. Schmoller, relates to more modern matters, being a treatise on stock-broking as at present carried on in Germany and in England. The materials for comparison are chiefly afforded by the reports of two English Committees, the Foreign Loan Committee of 1875 and the Stock Exchange Commission of 1878. The self-government of the London Stock Exchange excites the writer's admiration, and he thinks it should be the object of legislation and public opinion in Germany to discourage as far as possible speculation by members of the Stock Exchange in their individual capacity, and to build up an organized corporation out of the various exchanges dispersed throughout the country. It is mentioned that the securities of various descriptions officially quoted in the Berlin list have risen from 11 in 1820 to 636 in 1880.

The late Baron von Weber (10), the son of the composer, was one of the most distinguished engineers in Germany. Shortly before his death he made a tour of inspection of the principal

canals of Great Britain and Sweden, in the service of the Prussian Ministry of Public Works. His posthumous volume is not merely an account of the canals, but a history of the legislation respecting them, with copious statistics. The prolonged frosts in Sweden are evidently a great impediment to water traffic; nevertheless, nine out of fifteen canals are said to be paying well.

Lessing's wife was an amiable and interesting woman (11); his courtship is one of the most pleasing, and her death one of the most pathetic, passages of his history. It is merely as his wife, however, that she holds any place in general biography, and Herr Thiele's attempt at a monograph is not so much a supplement to Lessing's biographers as a repetition of things already too circumstantially related by them. It probably owes its existence to the Lessing centenary, and, being unexceptionable in taste and style, may pass muster fairly enough as a complimentary memorial.

Johann Georg Müller's notes of his residence with Herder (12) are much more worthy of republication. Müller, who afterwards became a considerable man, was in 1780 a young Swiss student, who sought Herder's acquaintance as an asylum against religious and philosophical doubt, and found all he sought. It is but natural that the visitor should dwell chiefly on the aspects of Herder's character of most concern to himself in his then state of mind; his account is, therefore, far from affording a complete picture of the man. It is nevertheless full of interesting traits, and especially displays the reaction in Herder's mind against the insipid rationalism of his day, which went so far as to dispose him to believe in intercourse with supernatural beings. Generally speaking, the mystical and devout side of Herder's disposition is more prominent than would have been anticipated—a circumstance which may be accounted for by the idiosyncrasy of his guest. In general he appears as a charming character of the purely idealistic type, refined and aspiring to a fault, but deficient in the perception of reality. Shaftesbury and Fénelon, kindred spirits, are mentioned among his favourite authors. Müller was greatly impressed by Goethe, although he saw but little of him; his account of Wieland, against whom Herder probably prejudiced him, is by no means favourable.

The Early English compositions whose authorship is investigated by Dr. Einkenkel (13) are the "Hali Meidenhad" and the legends of St. Juliana, St. Margaret, and St. Catherine, edited by Mr. Morton and Mr. Cockayne. All these, as well as the "Ancoren Riwele," are attributed by Mr. Cockayne to the same writer, whom he conjectures to have been Bishop Richard le Poor. Dr. Einkenkel, on the other hand, maintains that "Hali Meidenhad" is by a different author to the lives of St. Juliana and St. Margaret, but that these proceed from the same pen. The authorship of the legend of St. Catherine is reserved for a subsequent investigation.

Dr. Eugen Oswald has accomplished an excellent piece of work in preparing for the German public a memoir of Carlyle (14), with a selection of brief and pregnant passages from his writings. His appreciation of Carlyle, though warm, is discriminating, and better adapted than extravagant panegyric to recommend his hero to judicious readers. He might, perhaps, have made more use of the recently published autobiography, from which he would have learned, among other things, that the story of the destruction of the first MS. of the "French Revolution" is authentic.

No property of a good edition is wanting to the first book of Martial (15) as edited by J. Flach. The notes convey all requisite information in a surprisingly brief space, and the same conciseness and clearness distinguish the biography, notice of MSS. and editions, and other prolegomena.

The plot of Alfred Friedmann's version of *Don Juan* (16) is original. The statue of the Commander is omitted, and the action turns upon Don Juan's unsuccessful endeavours to seduce his brother's wife, in the course of which he evinces a sensibility and a sentimentality more like a character of Schiller's early period than the gay ironic hero of Molière and Mozart. The book is beautifully printed. "The Loss made Good" (17), by the same writer, is an amusing tale in the taste of Boccaccio, told very cleverly in musical verse, but with too many twists and interpolations for the sake of rhyme.

Besides a new but so far not very promising story by Gustav zu Putlitz, the *Rundschau* (18) has two biographical articles of considerable interest, and two more on the politics of the day. The latter consist of a survey of the present situation in South Africa, in which the humanity of English policy towards the natives is

recognized with sympathy and appreciation; and a review of the recent reaction in Russia, which promises to give the Panславic or "Muscovite" party their first opportunity of exhibiting themselves as serious politicians. The writer thinks that much might be urged in favour of this policy from a Russian point of view, if its execution could be entrusted to men of capacity, but that the paucity of such men in the "Muscovite" party renders it a dangerous experiment. The biographical papers include portraits of Conrad von Marburg, the first German Inquisitor, known to English literature as a leading character in Kingsley's *Saint's Tragedy*, and the modern Italian statesman Gino Capponi. The men have a certain resemblance to each as austere and dignified figures; Conrad a fierce and gloomy fanatic, the preacher of a crusade against heretics, the evil genius of St. Elizabeth of Hungary; Capponi, a loyal, uncompromising, unfashionable Italian Whig, devoted to his country as well as his Church, but for whom the times moved much too rapidly.

## NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

## THE SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,347, AUGUST 20, 1881:

Fair Trade. Mexico. Mr. Gladstone's Compromise. Cyprus.  
The Post Office Report. The Sallors' Strike. The French Elections.

The National Portrait Gallery. Agnostic Morality. A Pattern Sheriff. The Police in 1880.  
The Manners of the Omnibus. Mr. Whymper's Ascents in the Andes.  
A Forgotten Satirist. The Great Discovery in Egypt.  
Trade Prospects.

Mr. Symonds's Literature of the Renaissance.  
Madame Delphine. Colvin's Landor. Country Pleasures.  
Life of Voltaire. The Violin and its Music. Old Ail.  
Par Palimpsestorum Dublinensium. German Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

## ADVERTISEMENTS.

**DORÉ'S GREAT WORKS, "CHRIST LEAVING the PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH,"** each by 25 feet with 100 plates a Week. "Christian Martyrs," &c. at the DORÉ GALLERY, 35 New Bond Street. Daily, Ten to Six. 1s.

**ST. BARTHOLOMEW'S HOSPITAL and COLLEGE.** OPEN SCHOLARSHIPS IN SCIENCE.

TWO SCHOLARSHIPS of the value of £150 each, tenable for one year, will be competed for on September 20th, and the three succeeding days. One of the value of £120 will be awarded to the best candidate at this Examination, under twenty years of age, of sufficient merit. For the other, candidates must be under 25 years of age.

The subjects for Examination are Physics, Chemistry, Botany, and Zoology. The Entrance Examination will be completed for at the same time. The subjects of examination are Latin, Mathematics, and any two of the three following languages, Greek, French, German. This Open Exhibition of the value of £250.

Candidates must not have entered to the Medical or Surgical Practice of any Metropolitan Medical School.

The successful candidates will be required to enter at St. Bartholomew's Hospital in the October succeeding the examination.

For particulars application may be made to the WARDEN of the College, St. Bartholomew's Hospital, E.C.

**ST. GEORGE'S HOSPITAL MEDICAL SCHOOL, Hyde** Park Corner, W.

The WINTER SESSION will commence on Monday, October 2, with an INTRODUCTORY ADDRESS by Mr. J. WARRINGTON HAWARD, at 4 P.M.  
A Prospectus of the School, and further information, may be obtained by personal application between One and Three P.M., or by letter addressed to the DEAN at the Hospital.

**THE LONDON HOSPITAL and MEDICAL COLLEGE.** Mile-end, E.—The SESSION 1881-82 will Commence on Saturday, October 1, 1881. FOUR ENTRANCE SCHOLARSHIPS, value £20, £40, £30, and £20, will be offered for competition at the end of September to new Students. Entries on or before September 30. Fees for Lectures and Hospital Practice, 30 Guineas in one payment, or 100 Guineas in three instalments. All Resident and other Hospital Appointments are free. The Resident Appointments consist of Five House-Physicians, Four House-Surgeons, and One Aconchourship; Two Dressers and Two Maternity Pupils also reside in the Hospital. Special entries may be made for Medical and Surgical practice. The London Hospital is now in direct communication by rail and tram with all parts of the Metropolis.

MUNRO SCOTT, Warden.

**ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.**  
For the Science and Practice of Agriculture.  
For Intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c.  
The R.A.C. Farm, surrounding the College, is an excellent farm of about 500 Acres.  
Chairman of Committee of Management—The Right Hon. the Earl of DUCIE.  
For Prospectus of College and Farm, List of Scholarships, Prizes, Diplomas, &c., apply to the PRINCIPAL.

**CRYSTAL PALACE SCHOOL OF PRACTICAL ENGINEERING.**—The NEXT TERM opens on Monday, September 5, 1. Mechanical Course. II. Civil Engineering. III. Colonial Section—Preparation for Colonial Life, &c. Prospectus in the Office of the Crystal Palace Company's School of Art, Science, and Literature, in the Library, next Bazaar Court, Crystal Palace.

F. K. J. SHENTON, Superintendent Literary Department.

**MALVERN COLLEGE.** The NEXT TERM commences Tuesday, September 27. For particulars, apply to HENRY A. BARNES, Esq., Secretary.

**S. ANDREW'S COLLEGE, CHARDSTOCK, Dorset.** BE OPENED September 15. Preparation for Universities and Public Schools. Moderate and satisfactory terms. Apply to BARNES.

Principles and Practice of Medicine .. Prof. John E. Morgan, M.D., M.A., F.R.C.P.  
Surgery ..... Prof. Edward Land, F.R.C.S.  
Practical Surgery ..... Assistant Lecturer, Fred. A. Southam, M.B., F.R.C.S.  
Pathology and Morbid Anatomy ..... Thomas Jones, M.D., B.S., F.R.C.S.  
Surgical Pathology ..... Prof. J. Bruce, M.D., M.R.C.P., Alfred H. Young, M.B., C.M.

SUMMER SESSION.

Practical Physiology and Histology .. Brackenbury Professor, A. Gamgee, M.D., F.R.S.  
Practical Anatomy ..... Prof. Morrison Watson, M.D., F.R.S.E.  
Midwifery and Diseases of Women .. Prof. John Thorburn, M.D.  
Diseases of Children ..... Henry Ashby, M.D.  
Maternal Medicine and Therapeutics .. Prof. D. J. Leech, M.D., M.R.C.P.  
Medical Jurisprudence ..... C. J. Collingworth, M.D., F.R.C.P.  
Hygiene and Public Health ..... Prof. J. Bruce, M.D., M.R.C.P.  
Practical Morbid Histology ..... Prof. J. Bruce, M.D., M.R.C.P.  
Mental Diseases ..... George W. Mould, M.R.C.S.  
Ophthalmology ..... David Little, M.D.  
Operative Surgery ..... Thomas Jones, M.B., B.S., F.R.C.S.  
Practical Chemistry ..... Prof. H. E. Rose, LL.D., F.R.S.  
Embryology ..... Prof. A. Milnes Marshall, M.A., D.Sc.  
Botany ..... Prof. W. C. Williamson, F.R.S.

IV.—DEPARTMENT OF EVENING CLASSES.

Classes conducted by the Professors and Lecturers of the College and external Lecturers are held during the Winter Months in nearly all the Arts and Science subjects.

The NEXT SESSION will commence in the Medical Department on October 1; in the Arts and Law, and the Science and Engineering Departments on October 4; and in the Evening Classes Department on October 10. Candidates for admission must not be under Fourteen years of age, and those under Sixteen will be required to pass a preliminary examination in English, Arithmetic, and Elementary Latin.

Prospectuses of the several Departments and of Entrance and other Scholarships, amounting in the aggregate to about £1,500 a year, may be obtained at Mr. COHEN'S, Piccadilly, and at other Booksellers in Manchester, and they will be forwarded from the College on application.

J. HOLME NICHOLSON, Registrar.

## BRIGHTON COLLEGE.

Principal Rev. T. HAYES BELCHER, M.A., Queen's College, Oxford.  
Vice-Principal—Rev. J. NEWTON, M.A., St. John's College, Cambridge.

The NEXT TERM will commence on Tuesday, September 20.

F. W. MADDEN, M.R.A.S., Secretary.

## ISLE of WIGHT PROPRIETARY COLLEGE, APLEY

(near Ryde).

The WINTER TERM will commence on Friday, September 16.  
Full particulars from the Rev. Canon TEESDALE, Head-Master; or the SECRETARY, The Cottage, Melville Street, Ryde.

## SOMERSETSHIRE COLLEGE, Bath.—The CHRISTMAS

TERM commences Saturday, September 17.

Boursers are received by the Head-Master.

## ABINGDON SCHOOL.—This Foundation (A.D. 1563), Six

Miles from Oxford, has complete new buildings in large grounds. Classical and Modern Departments, with strong staff of Masters, valuable University Scholarships. Thorough preparation for the Military and other Professional Examinations, and careful grounding for Boys whose destination is the larger Public Schools. Well-ventilated Private Studies and Libraries, Five Courts, rowing for Boys who swim.  
School Fees, £27 to £33, advantages to the Sons of the Clergy.  
Apply to the Rev. E. SUMMERS, B.D., Head-Master.

## PREPARATION for the UNIVERSITIES, for the NAVAL,

MILITARY, and CIVIL SERVICES, and for general purposes, under the direction of the Head-Master, the Rev. JAMES WHITE, M.A., late Head-Master of the Oxford Military College, and formerly Instructor of Mathematics at the Royal Military Academy, Woolwich; assisted by a large staff of Resident Masters, Graduates in Honours of Oxford and Cambridge. The Michaelmas Term commences on September 16. Applications for information as to Cadetships, Exhibitions, Scholarships, Medals, Terms, &c. to be made to the Secretary.  
By Order of the Council,

Royal Naval School, New Cross, August 1881.

ALFRED EAMES, Secretary.

## TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.

The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially for Modern Languages. Special preparation for the Universities, Army, and all competitive Examinations. Exhibition to the Universities of £50 per annum. Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Terms 50 and 60 Guineas. Apply to the WARDEN.

## SOUTH KENSINGTON PREPARATORY SCHOOL,

35 Hereford Square, Gloucester Road, S.W.—The SONS of NOBLEMEN and GENTLEMEN are thoroughly prepared for Eton and other Public Schools. Careful individual attention. Special care of young boys just leaving home. Experienced Governors for young Pupils. Head-Master, A. B. SCOTT.

## HIGHGATE SCHOOL.—The Next Term commences Tuesday,

September 20. In the Indian Civil Service Examination of this year a Pupils passed direct from the School 17th out of 31 successful Candidates, and was first for Greek and first for Latin of all the Candidates.—For particulars of admission, apply to the Rev. C. McDOWALL, School House, Highgate, N.

## FINDEN PARSONAGE, WORTHING, Sussex.—The Rev.

W. D. ALLEN, M.A., Vicar of Finden, Fellow and, from 1872-1881, Tutor of Magdalen College, Oxford; old Englishman, has vacancies for HOUSE PUPILS, to be prepared for the Universities, &c.

## OVERSLADE PREPARATORY SCHOOL (near RUGBY).

The Rev. G. F. WRIGHT, M.A., late Fellow of C.C.C. Camb., formerly Assistant-Master at Chesham School and Wellington College, prepares BOYS from Eight years of age for the Classical or Modern Side of Public Schools.

**COLLEGE AND GRAMMAR SCHOOL, AUCKLAND.**  
NEW ZEALAND. A HEAD-MASTER IS REQUIRED for this Institution. It must have graduated in Honours at one of the leading Universities in the United Kingdom, and experience and success as a Master in some important Public School. The salary will be £200 per annum, without house allowance, but with a Capitation Fee of 10s. for every child paying school fees. £150 will be allowed for passage money to the Colony.  
The following references are requested to be sent as soon as possible to the Secretary,  
Master, Rugby School, Edinborough; Professor Jowett, of Oxford; Arthur Sidwick, of Oxford; and the Rev. S. M. Wilson, Clifton College. Intending candidates can obtain at the undersigned application forms and printed statement giving further particulars as to the School, and conditions of the appointment. All applications must be made on or before August 1st, 1907.  
Apply to the Principal, Mr. C. H. B. GIBSON, Headmaster, St. Albans School, New Zealand Government Office, Wellington, or to Messrs. W. & A. GILLESPIE, NEWBAY, New Zealand.

**FURNISH YOUR HOUSE OR APARTMENTS**  
THROUGHOUT OR PART OF THE WIRE SYSTEM. The original, best and best.  
liberal. Cash Price, \$100.00. Cash Price, \$100.00. Cash Price, \$100.00.  
Illustrated price list, \$100.00. Cash Price, \$100.00. Cash Price, \$100.00.

## THE FRENCH COMMERCIAL TREATY.

IT is hardly worth while to discuss the question whether the French Government had legal power to prolong the Commercial Treaty for three months after the 8th of November. The official assurance that they were prohibited from entertaining the proposal was conclusive as an answer to the English request. It is equally true that Lord GRANVILLE and his colleagues were fully justified in refusing in present circumstances to continue a useless negotiation. It is by its own deliberate act that the French nation has precluded itself from taking the steps which would render a new Commercial Treaty possible. Foreigners have neither the right nor the duty of inquiring how far the disability is irremovable. It is a commonplace rule in international transactions that no State can plead municipal law, which is merely the expression of its own will, as a reason or excuse for dereliction of duty, or, as in the present case, for an error in policy. The fact is that the discretion which is withheld by a recent law from the French Ministers was purposely renounced by themselves when they introduced into the late Assembly the measure relating to commercial treaties. The Cabinet, or M. TIRARD, who seems to have had the exclusive conduct of the business, thought that the hands of the French Government would be strengthened by a compulsory limitation of the time allowed for discussing the treaty. It has hitherto proved impossible to convince French politicians that English traders would in any case allow the existing relations to expire. In arranging bargains, public or private, either party is at a disadvantage if it miscalculates the ultimate resolution of the other. The French Ministers, not themselves disinclined to moderation, were anxious to conciliate the manufacturers and other Protectionists by an increase of the tariff, which, as they fancied, would be deemed in England less objectionable than the alternative of the general scale of duties, which is nearly prohibitive. They therefore invited the Legislature to tie their hands, for the purpose of placing pressure on the English Government.

The consequent refusal to continue the sittings of the Commission appears to have taken M. TIRARD by surprise. The journals which represent the Department of Commerce unanimously profess astonishment at the only decision which would not have been grossly inconsistent with the repeated Parliamentary declarations of the PRIME MINISTER and the PRESIDENT of the BOARD of TRADE. The English Government had from the first announced, as an indispensable condition, that any treaty which might be concluded must be, on the whole, not more unfavourable than the convention which is about to expire. It may be assumed that they had satisfied themselves that no such arrangement could be concluded in the six or seven weeks which are now left for negotiation. The refusal of the French Ministers to extend the time proves that the Commissioners had not even approached to an agreement. Under the authority which had been demanded of the Legislature by M. TIRARD himself, the term might have been extended to the 8th of January, if the negotiations had arrived at such a stage as to give assurance of a final settlement. It was because the French Commissioners were bent on obtaining additional protection, which their colleagues were not authorised to concede, that the negotiation was refused, and that the English Government consequently discontinued the negotiations. One of the official or

semi-official paragraphs contains the curious statement or conjecture that the newly-elected Assembly will be more adverse to Free-trade than its predecessor. There seems to be no sufficient ground for an opinion which is declared for the purpose of urging on the English Government an additional motive for concession. The reactionary party, which is largely reduced in numbers, is generally opposed to sound economic principles, while the Republicans are divided in opinion. The extreme faction, which, in France as elsewhere, is hostile to commercial freedom, has not increased its strength by the result of the late contest. It may be added that at the beginning of a new Parliament members are comparatively independent of their constituents.

Notwithstanding the disappointment which is expressed by the Ministerial press, it is doubtful whether the French Government really desires to conclude a treaty not more irrational than the last. M. TIRARD supposes himself to be an advocate of Free-trade, and some of his colleagues theoretically hold the same opinions; but they know that competitors for office will be ready to take advantage of any unpopularity which the Government might incur by an alleged sacrifice of French interests. They are perhaps also hampered by the clause in the Treaty of Frankfort which secures to Germany the privileges of the most favoured nation. Any concession which might be sold to England would become at the same time a gift to Germany. There is no doubt that such clauses hamper the free action of Governments, though they are commonly, and not without good reason, inserted in treaties. It is useless to stipulate for a moderate duty on the products of the negotiating State, if similar articles may be imported from another country at a lower rate. Low duties on Bordeaux wines would not be acceptable to the grower of the Gironde, if he were undersold by the untaxed importation of the produce of Spain and Portugal. The provisions of the German treaty furnish no valid excuse for a refusal to deal equitably or rationally with England. The favoured nation clause has now operated for ten years in conjunction with the existing English Treaty, which is not more illiberal in its stipulations than any substitute which is likely to be proposed. Although the hands of the French Government were not free in 1871, it has really suffered nothing by any policies which may have been offered to German commerce. One of the evil consequences of the artificial system of commercial treaties is that they foster the prejudices which indeed account for their existence. Mr. COBDEN himself, though his French Treaty did more good than harm, is responsible for some of the delusions which now affect the commercial policy of France. Under the enlightened rule of NAPOLEON III. and M. ROUHER the French obtained compensation for advantages conferred on themselves; they now, under less intelligent rulers, demand an additional price for a continuance of the same benefits.

If the professed desire of the French Government to conclude a treaty is sincere, there is no reason why the negotiations for the purpose should not be instituted at any time which may be deemed convenient. The disabling law which M. TIRARD induced the Legislature to pass only applies to the existing treaty, which will apparently be allowed to expire. A new treaty might be concluded in 1882 as well as in 1881. It is true that the cessation or suspension of trade in the interval would be a serious evil to both countries. The sufferings which

it is on some industrial communities in England which possibly incline them to promote conciliatory negotiations difficult. In the meantime there would be an animated demand for retaliation, which would ultimately take the form of a proposed increase of the duties on French wines. There would be much stronger objections to duties on articles produced in England which would necessarily have a protective operation. Only a rudimentary acquaintance with economic principles is required to distinguish between the respective effects of taxes on exotic luxuries and on competitive products. A duty on wine would have no protective tendency, unless, indeed, it indirectly caused an increased consumption of beer. A duty on silk goods, or on French brandy, which competes with English spirits, would, as far as it was levied on imports, contribute to the revenue; but it would at the same time increase the price of English silks or English gin, for the exclusive benefit of the manufacturers. It is for this reason that duties on tea, wine, and tobacco are legitimate as far as they are fiscally expedient. Duties on machinery or on textile fabrics would be largely paid to private persons, who have no claim on the national funds. It would be inexpedient, and indeed impracticable, to tax large classes of French imports, including eggs, poultry, rabbits, fruit, and vegetables. The great mass of Englishmen will never submit to an artificial increase in the cost of provisions.

Mr. GLADSTONE, as long as he directs the financial policy of England, will be loth to discourage the importation of French wines. When he introduced, in 1860, the legislation which was necessary to give effect to the French Treaty, he persuaded himself, with characteristic facility, that, in cheapening claret, he was not only promoting commercial intercourse, but effecting a moral reformation. Not without reason, he thought that light claret would be wholesome in moderation, and that it would seldom be consumed in excess. He even amused the House of Commons by expatiating on the advantage to be derived by maids of all work if they were no longer sent for pots of beer to the public-house round the corner. To some extent his hopes have been justified by the result. An innocent, if not palatable, beverage is largely consumed by the middle classes, though light claret has hitherto scarcely penetrated the haunts of drunkenness. An increase in the price of ordinary wines would be a serious evil, though the additional charge on costly vintages might be almost imperceptible. That Mr. GLADSTONE'S enthusiasm for the cause of light claret has not subsided after the experience of twenty years, is proved by his Budget of 1880. He then made considerable changes in the system of taxation for the purpose of facilitating the commercial treaty which he then regarded as a certain result of negotiation. Another reason against a hasty alteration of the duties on French wines is to be found in the complications which might arise in dealing with Spain and Portugal. Any preference which might be granted to either country, though it might procure some relaxation of existing tariffs, would be objectionable if it caused any impediment to the renewal of commercial relations with France. It is well that no hasty fiscal legislation is possible at this time of year. In enacting or abolishing commercial treaties in all other important transactions, it is undesirable to be in a hurry. There is nothing to prevent the newly-elected French Assembly from passing any law which may remove the difficulty which was created by M. THIERS.

#### THE INDIAN BUDGET.

THE bankruptcy of India is a long time coming. By this time, according to calculations which seemed plausible when they were published, she ought at least to have made a composition with her creditors. As it is, the financial abyss which makes the staple of Mr. HYNDMAN'S sermon turns out, now that it is reached, to be not at all a bad sort of place. Surpluses grow there quite naturally, though like trees on a mountain side when they get to the level of the wind, they are apt to be cut down by unforeseen war expenses. The nation that has no history naturally gives birth to the Secretary of State who has no listeners. If Lord HARTINGTON had had to speak of impending loans, and to hint at Imperial guarantees, the

House of Commons might have been excited even in the third week of August. But to both of aggregate balances of income over expenditure—even though those balances, and something more, have as a matter of fact been spent—is dull work, and this was really all that Lord HARTINGTON had to give the members whom a sense of duty, or the want of any better way of getting through the evening, kept in their places.

The cost of the Afghan war is at last known. Including the making of the frontier railways, it is £11,500,000. Into the extraordinary miscalculation which, sixteen months ago put the expenditure at about £10,000,000, this sum, Lord HARTINGTON did not enter, and, perhaps, it is enough to know that, under the system of keeping the accounts which has since been adopted, it is impossible for such a mistake to recur. If it is to happen at all, it is best that a war should be the occasion of it. As regards other kinds of expenditure, the actual figures are an important element in determining whether the outlay shall be incurred. But we had known what the Afghan war would cost, and should still have gone on with it. The policy of the late Government may have been right or wrong, but as it was not adopted because it was cheap, it would not have been abandoned if it had been known to be dear. The money has been provided from four distinct sources. The ordinary surpluses of the four years, from 1878 to 1881, have provided nine and a half millions; the Famine Insurance Fund has been appropriated to the amount of four millions; four millions and a half were taken from the cash balances; and the Imperial Treasury contributed five millions. It was reasonable that India should give up her surpluses during the war, and as she will reap the unexhausted benefits of the frontier railways, there is no great hardship in burdening her with the money which has to be borrowed to replace the cash balances. But the Famine Insurance Fund ought not to have been diverted from its proper purpose. Scarcity will not be staved off by the fact that we were fighting the Afghans during the years when we ought to have been making provision to meet it, and the money which the Government of India could not provide without laying hands on funds set apart to meet equally unavoidable demands, might well have been contributed by England. A grant of nine millions, in place of one for five, would have fairly distributed what was, in the fullest sense of the word, a joint liability. For the future the cost of provision against famine is to be included in the estimated expenditure of the year. If any charge for actual famine relief arises during the year, it will be defrayed out of this sum. If there is no call for any such expenditure, the money will be appropriated partly to protective works—that is, works which cannot be expected to yield any direct return in the way of rent or increased revenue, and partly to the reduction of debt. Among the protective works which are first to be undertaken are a canal in the Deccan and a railway in the Punjab. It is to be hoped that, now that works are to be undertaken without reference to immediate money profit, the tanks made under the native rulers of India, which have been allowed to fall into ruin, will have a chance of getting repaired. They are uninteresting, no doubt, to modern engineers, but there is good reason to believe that, if they had been properly kept up, they would have averted, not, indeed, the great historical famines, but some of the recurring local scarcities. It is satisfactory to learn that the agricultural department, which was unfortunately given up a few years back, is to be reconstituted. No doubt, if such a department were to attempt any sudden introduction of European methods of farming, it would do more harm than good. In agricultural matters the Government of India has to learn as well as to teach. It has to study and compare the traditional rules of thumb which are most valued by native cultivators, to discover the scientific laws which underlie them, and to modify the application of these laws by the experience thus gained. Administered in this spirit, the Agricultural Department may be of the greatest possible value to India.

Lord HARTINGTON'S observations on the Indian cotton duties will be variously taken as confirming the views of those who think that they ought not to have been meddled with and of those who think that they ought to have been altogether repealed. The advocates of total abolition have, however, the immense advantage over their oppo-

ments that, as the reimposition of the duties which have been taken off is impossible, and the maintenance of those which remain is disadvantageous like to India and Lancashire, there is but one practical conclusion from Lord HARTINGTON'S reasoning. We have, it seems, ingeniously managed by one and the same process, to destroy a particular type of native manufacture and to close a number of English mills. A duty which combines these opposite demerits cannot be too soon got rid of. We retain our former doubts as to the propriety of touching these duties at all, and the Indian revenue contained no more objectionable item; but there can be no advantage in retaining a tax which has ceased to be important from the financial point of view, while it has become useless to the native producer, and positively injurious to the native consumer. The latter is forced, if Lord HARTINGTON rightly describes his position, to take from England, not the class of goods which he wants, but the class which the English manufacturer is able, owing to the peculiarities of the tariff, to supply most cheaply. The coarser fabrics are now admitted free of duty; the finer fabrics are still taxed. The result is that, as regards the goods which the native manufacturer was able to supply, he has been driven out of the market; while the duty excludes those finer fabrics which are especially suited to English machinery.

It is no commendable in members of the House of Commons to take an interest in Indian affairs that we are unwilling to speak harshly of Mr. FOWLER'S motion for a Committee of Inquiry into the financial and general administration of India. But a more inappropriate way of showing this interest could hardly have been devised. It is not merely that, as Lord HARTINGTON pointed out, it is not good for the Government of India to be continually burdened with the expense of sending over Indian officials to be examined, while it has at the same time to forego their services during their absence. A worse injury than this is the publicity and importance which the existence of such a Committee gives to the crotchets that grow up like mushrooms in the minds of a certain class of members whenever India is mentioned. A Committee on the financial and general administration of India would bring out men like Sir DAVID WEDDERBURN in their most terrible aspect. The knowledge accumulated in the course of a three months' tour, and the ripe meditation evidenced by an article in a monthly magazine, would alike be at the service of the Committee. The questions which such a member would put to the witnesses would be numbered by tens of thousands; the minority report signed by himself and one kindred spirit—who would, however, dissent from most of his colleague's conclusions—would make a Blue-book of itself. It would be interesting to know for what purpose members of Parliament who are eager to have Select Committees continually inquiring into Indian matters suppose that the Government of India exists. It would be far more reasonable to appoint a Select Committee to inquire into the financial and general administration of England, because the frequent political changes which take place at home make it quite important and difficult to maintain a continuous tradition in the public service. But in India, except as regards a frontier policy, there is such a tradition. Indian affairs are administered, not indeed perfectly, but as well as an unusually capable body of public servants find it possible to administer them. Mr. FOWLER seems to suppose that a Committee consisting of ex-secretaries and under-secretaries might with advantage "go into" all matters connected with India. If the Committee could be entirely drawn from this class no objection need be made to its appointment. Its report could be drafted beforehand, and would certainly be to the effect that, as your Committee are convinced that the questions referred to them are best left in the hands of the skilled and responsible officials actually engaged in the government of India, they have not thought it necessary to call witnesses or to pursue the inquiry further. But a Select Committee would not be exclusively composed of members representing the official view. It would contain a large proportion of members "anxious," as Mr. FOWLER puts it, "to show the people of India that the House of Commons is deeply impressed with a sense of responsibility towards them." If this anxiety were according to knowledge, it would take the form of leaving the people of India to the care of those who are most likely to govern

them well. Being what it is, it would simply prompt those inspired with it to follow the example of Mrs. NICKLEBY, and express a large variety of opinions on a large variety of subjects.

#### ELECTION AFFAIRS.

THE Irish Land Bill at home and various matters of more or less importance abroad have for some time diverted the eyes of most people from attending to what is really the most interesting of all studies to a practical politician—the progress and tendency of political opinion at home as manifested in the by-elections which occur from time to time. Indeed, from some chance there have been of late, till within the last few days, comparatively few of these elections, which were rather more than usually numerous during the first year of the life of this Parliament. A slight and rather remarkable instance of reviving interest in electioneering matters was afforded by the curious defeat last week of the Government in the matter of the Wigan Commission—"the great constitutional crisis," as a Liberal member, in what for the present dull House of Commons was not a bad joke, described it. As a matter of fact, no doubt, the victory, such as it was, was a cleverly snatched one, resulting from the clannishness of Lancashire, the discontent of the Irish members, and a sudden and skilful whip of the remnant of the forces of the Opposition. But it showed that, if the pressure of other affairs had allowed the Corrupt Practices Bill to come on, it would probably have been the cause of a lively fight, which would not by any means have been a merely party one. It showed, also, that a certain reaction of public feeling has taken place, as might have been expected, from the somewhat inquisitorial proceedings of the various Election Commissions, and from the results of those Commissions as far as they have yet manifested themselves in the trials of the offenders. The signal failure of the Boston prosecutions could only be set down by very shortsighted judges as due to local partisanship. It was almost an inevitable consequence of the revolt which such sense of fairness as is yet left in England makes at the present method of conducting election inquiries. That the Commissioners should choose certain persons to summon, and certain not to summon, and should by this choice ensure immunity from prosecution to the one, and render the others liable to prosecution, is not the sort of thing that commends itself to the possibly obtuse, but frequently generous, judgment of the average Englishman, especially as it generally results in the more hardened and skilful offenders escaping, and the novices and blunderers being caught. Nor is it to be forgotten that popular sentiment has as yet declined to recognize bribery as a crime, though it has ceased to regard it as altogether venial; and that there is a wholesome objection to the manufacturing by law of new crimes, the criminality of which is not generally recognized. The case of Wigan was, no doubt, an exceptional one; but there was something of the rule in it as well as of the exception.

This little comedy, however (in which Sir HENRY JAMES, after being caught out in his law and beaten in the division lobby, may perhaps have failed to recognize the comic part), is by no means the serious election affair of the day. Besides the seat for Tyrone, vacant by Mr. LATTON'S appointment to a Land Commissionership, no less than five seats were vacant in Great Britain at the beginning of the present week—three of them by official promotions and shiftings, two by death. One of these was the constituency of the Elgin Burghs, vacant—for the second time within a few weeks—by Mr. ASHER'S promotion to the Scotch Solicitor-Generalship. The second was that for Edinburgh, vacant by the resignation of the Lord Advocate on his appointment as a Lord of Session. The third was Mr. HERBERT GLADSTONE'S seat at Leeds, vacant by reason of his becoming what Lord ROSEBURY rather ominously called "the last Lord of the Treasury." The fourth was the county seat of North Durham, and the fifth the county seat of North Lincolnshire—both vacant by the death of the late members. All these were Liberal seats. The three borough constituencies have already made their choice, or rather have had no choice to make. Mr. HERBERT GLADSTONE, after indulging, under the patronage of a warlike Alderman, who announces that he intends to devote the remainder of his life to the

extermination of the House of Lords, in some of the precocious dogmatism which seems to form his intellectual stock-in-trade, has been returned unopposed. Edinburgh has entrusted itself without a contest to another very young person, who is unknown to public life, but who has a respectable Oxford record, and who did not win his spurs at the last general election against Lord Elcho. Elgin and its satellites have been constant to Mr. ASHER. For the two county seats a remarkable difficulty seems to have been found in finding Conservative champions. On the eve of the nomination two candidates who may fairly be called strong, Sir GEORGE ELLIOTT and Mr. LOWTHER, presented themselves; but up to that eleventh hour it was not certain whether these also would not be allowed to go by default to the highly respectable candidates, who, with a proper absence of self-committal to extreme principles, woo them on the Liberal side.

Had this been so it would have indicated the existence of a very curious state of things. As to the artificially vacated seats, it might be said that the Government, taught by uncomfortable experience in Wigton and Oxford, took care to disturb only those who were quite safe of re-election or of replacement by the right sort of man. The group of small constituencies which was so long represented by Mr. GRANT DUFF is traditionally Liberal, though its most important member—Peterhead—is said to have Tory leanings, which have hitherto awaited development in vain. Edinburgh declared itself in favour of Mr. GLADSTONE (who had virtually wooed it at the same time as its county) by an enormous majority last year. Leeds is perhaps more dubious. It can hardly be supposed that the entire population of a large, wealthy, and not unintelligent town shares its Alderman's bloodthirsty designs on the House of Lords, or that the inhabitants of the cloth capital are one and all beguiled by the honour of sending to Parliament a Prime Minister's youngest son, who has a fine capacity for indiscriminate assertion. Yet the Leeds Conservatives, who once held two of the seats, made no sign, which, as Mr. HERBERT GLADSTONE remarked, with the graceful courtesy which sits so pleasingly on youth, and which he has more than once exhibited, was "prudent" of them. The two county seats are, however, the most instructive. Neither is what may be called a Tory stronghold, but both were held in the last Parliament by Tories, and in both the Tory candidate was beaten last year by majorities of no very decisive character. The abandonment of them, therefore, would have been a sign either of remarkable apathy, or of singularly bad organization, or of some peculiar cause affecting the class from which candidates are drawn. In all of these reasons there is probably some weight. Landowners and great merchants—the only two classes of persons who can, as a rule, afford the expense of a county contest—are just now very badly off. The benumbing effect of the defeat of last year has not yet passed, and in very few cases is the organization of the Conservative party vigorous and complete. But a general reluctance to take the field would not have been of good omen, even if no merely party point of view were taken for considering it. Paradoxical persons have been found to maintain that the advantage of bribery was that it kept up a lively interest in political matters. The badness of the means may have exceeded the goodness of the end, but about the goodness of the end there can be no doubt whatever. A country in which individual interest in politics is replaced by a mere acquiescence in the dictates of caucus leaders is a country in a very bad way. Indeed, one of the very worst things about these new-fangled organizations is that they tend to render politics a mere tournament of Renaissance Italians, in which hard fighting is out of fashion. No human being can, without an extraordinary intellectual conviction, long take an interest in a party which will not fight. In how many persons this sort of intellectual conviction subsists must of course be a matter of doubt; but the number of voters in any particular constituency who can form with intelligence and support with knowledge political opinions of any kind is, and always must be, very small. Some means must therefore be used to keep adherents together, and of those means the most certain is giving battle on every occasion when there is the least hope of success. Nothing has been hitherto more remote from the general temper of English politicians than acquiescence in the domination of a mere prevalent party, no matter what the opinions of that party may be.

Nor can anything be less desirable from any point of view, Tory or Liberal, except from the point of view of those who simply desire to destroy as much as possible during the time of apathy, than that the spell of that apathy should continue. It is in the shock of opposing forces that healthy and vigorous political life consists, not in the continual acting of a tedious and monotonous drama of surrender.

#### THE POPE AT MALTA.

WHEN the POPE from time to time intimates through his recognized organs that in certain contingencies he may remove his residence from Rome, the menace is probably rather an expression of legitimate indignation than the announcement of a serious purpose. In former times the abandonment of the central seat of Latin Christianity would have alarmed the consciences of great numbers of Catholics in almost all parts of Europe; and even so late as the time when the late Pope commenced his reign, his compulsory exile might have been regarded as a cause of war. Through his own fanatical imprudence, combined with unfavourable circumstances, PIUS IX. contrived successively to alienate every Government which had treated the Holy See with devotion, with good will, or with tolerance. He refused to recognize the kingdom of Italy, he affected to regard the Constitution of Austria as non-existent, and at one time he provoked the great body of Englishmen, who might have treated his pompos proclama tions with contempt, into a temporary outburst of violent irritation. The so-called battle of civilization in Germany was provoked, though scarcely justified, by the absurd decrees of the Council of Rome. The POPE might perhaps be excused for resenting the patronizing protection of France; but a statesman would not have publicly designated the Emperor NAPOLEON by the name of PONTIUS PILATE. PIUS IX. could not have perpetuated the temporal power, but his vanity and weakness precipitated its fall. His manlier and more prudent successor cannot repair the mischief which has been done to the Papacy; but he will be well advised in retaining as long as possible his hold on St. Peter's and the Vatican.

While the POPE was still a reigning sovereign, officious Protestant advisers not unfrequently assured him that his influence over the faithful would be increased by resignation of his secular prerogative. Since he has been forced to submit to the result of their condescending counsels, he has found, as more sagacious observers anticipated, that his spiritual authority collapses almost as rapidly as his temporal power. Austria is united in close alliance with the persecuting Government of Berlin; the Subalpine KING, as PIUS IX., with feminine spite, delighted to call him, holds his Court on the left bank of the Tiber. Spain has formally disclaimed any purpose of defending the rights of the Holy See; and in France, which used to be called the eldest born of the Church, the clergy have lost all political power. It would be a suicidal mistake to renounce the security of the treaty or statute which is known as the Law of Guarantees. It is true that the Italian Government has culpably neglected to afford the protection which was due on the occasion of the late funeral procession; but it would be a poor revenge to resign the rights which are acknowledged, though they have been unduly withheld. Within his own palace and its precincts, the POPE is still nominally independent and sovereign. Elsewhere he would be a subject or a resident foreigner, with no claim to rank or pre-eminence except by the courtesy of the local authorities. It is doubtful whether the large revenue which the POPE derives from the contributions of the faithful would be forthcoming if Catholic liberality were required to flow in unaccustomed channels. In the so-called ages of faith the Popes who resided at Avignon, though in their own territory, were regarded with diminished reverence. There is now no possibility of acquiring a Papal appanage on either side of the Alps, and a Pope cannot afford to subside into the rank of a private person.

When the POPE or his partisans threaten a secession from Rome, they for the most part propose that he should establish himself at Malta; and it is easy to understand the reasons by which such a choice of residence might be recommended. The people of Malta are, perhaps, the most unsophisticated of believers in Roman Catholic Christendom.

Their language, which is a dialect of Arabic, secures them against communication with heterodox foreigners, although they are indebted to their present rulers for reducing their speech for the first time into writing. The island swarms with priests and clerics of every degree; and the pious practices which furnish the inhabitants with occupation and amusement might by a hasty observer be easily mistaken for Pagan celebrations. The clergy, who speak Italian as well as Maltese, entertain a peculiar devotion to the Holy See, and they are not unnaturally proud of the privileges to which their Church is entitled under the capitulations by which Malta was annexed to the British Empire. That the Roman Catholic Church is established has never been disputed, and the priests have added to its legal style the further qualification of "dominant." The ecclesiastical buildings and practices of the English heretics are supposed to depend for their existence on a toleration which would not be voluntarily accorded. The English Government and its representatives in the island have generally regarded the zeal of the Roman Catholic priesthood and its adherents with good-humoured indifference. Perhaps it had not been forgotten that, when the Republican French occupied Malta in the place of the Knights of St. JOHN, their profanation of the churches and their insults to religion induced the inhabitants to welcome the English besiegers, who, not without their help, at last compelled the French garrison to surrender. It is not probable that in future any Catholic invader will be able to appeal to the religious sympathies of the Maltese against the rulers who have always respected the susceptibilities of their subjects. Neither France nor Italy can at present easily assume the character of champions of the Church; and the Maltese also, scattered over the coasts of the Levant, prefer English protection to the patronage of any foreign Power.

The POPE would nevertheless not be a welcome guest. If he were to reside at Malta, the English Governor, though he would still occupy the Grand Master's Palace, would no longer be the highest personage in the island. The Roman Catholic clergy would delight in ostentatious preference of their allegiance to the POPE over their not enthusiastic loyalty to the Crown. The well-meaning population would easily be persuaded to regard as sovereign the spiritual potentate, who would not on his own account advance any territorial pretensions. Some years ago they submitted to a usurpation, which to their simple minds must have seemed far more startling than the subordination of the State to the Church. PIUS IX., with his usual puerility, transferred the Church of Malta from the traditional patronage of St. PAUL to the protection of the VIRGIN under her title of Immaculate; and such was the reverence of the Maltese for the Holy See that they accepted without remonstrance the wanton breach of the most respectable of their historical associations. As long as the Pope and his Court were content with ceremonial claims of precedence their pretensions might be rather troublesome than dangerous; but it is possible that cases might occur in which a conflict of secular and ecclesiastical authority might be seriously inconvenient. The English Government and nation have had no reason to complain of the present POPE, who has on more than one occasion deprecated rebellion and agrarian crime in Ireland; but his protests against revolutionary violence appear to be as impotent where some of the perpetrators are Roman Catholic priests as in the countries where the clergy are the victims. That law, morality, and order are regarded by some members of the Roman hierarchy as trivial in comparison with the supposed interests of the Church has lately been proved by Cardinal MANNING's surprising declaration of sympathy with the organization and objects of the Irish Land League. It could scarcely have been anticipated that a dignified ecclesiastic, by birth and education an English gentleman, would approve the communistic doctrines and the murderous practices of the associated enemies of the English Government. The complicity with the worst demagogues, of turbulent peasant priests, or even of disaffected Irish prolates, may not admit of excuse, but it is easily intelligible. It can only be conjectured that Cardinal MANNING preferred tampering with social and political revolution to the risk of giving offence to the malcontent Irish who form the majority of his flock. Any other conceivable explanation of his conduct would not be less discreditable. The incident illustrates the inconvenience of intimate relations with a Church which

will always regard its own special interests as paramount to all worldly duties. There would be something amusing and gratifying to national vanity in the opportunity of affording a refuge on English territory to a great spiritual potentate who might seem to be rejected by all the communities which nominally acknowledge his supremacy. If the case arises the Government of the day may, perhaps, think that the apparent harshness of a refusal would be more objectionable than the possible inconvenience of welcoming the illustrious exile. Until the proposal is formally made, it will be prudent to discountenance a project which, if it were accomplished, could scarcely fail to cause embarrassment. The POPE still possesses and exercises the right of receiving Ambassadors; and the presence of foreign representatives in a colony which is really a fortress would be both anomalous and troublesome. The duty of Roman Catholic bishops to visit the tombs of the Apostles at limited intervals would, if it were transferred to the temporary residence of St. PAUL, and the permanent home of the successor of St. PETER, overtax the hospitality of the English Government. It would be easy to multiply illustrations of the confusion which might arise from the conversion of a dependency of a Protestant Power into the spiritual metropolis of the Roman Catholic world.

#### THE FRENCH ELECTIONS.

WITH the single exception of Belleville, where the opposition to M. GAMBETTA proved itself to have more substance than had commonly been attributed to it, the French elections have gone precisely as they were expected to go. A large proportion of the outgoing deputies have been re-elected; the Republican majority is mainly composed of members who intend to give a general support to M. GAMBETTA; and the Conservative minority is reduced to insignificance. The narrow victory which M. GAMBETTA has gained in one circumscription of Belleville, and his relinquishment of a doubtful contest in the second, set at rest the question of his relations with the Extreme Left. If the voting in these exceedingly advanced constituencies had shown that the Paris Radicals retained a secret affection for their former leader, the action of M. CLÉMENTEAU, M. CAMILLE PELLETAN, and the other leaders of the Extreme Left would probably have been modified. It might have been unwise to go on proclaiming war to the knife against a politician who had just been chosen by a large majority to represent men who, in so far as they differ from M. CLÉMENTEAU, do so in carrying their violence to greater lengths. The voting of Sunday put an end to all uncertainty upon this head. It showed the rank and file of the Extreme Left in as open rebellion against M. GAMBETTA as M. CLÉMENTEAU need desire. After what has passed, it seems impossible that a reconciliation should ever be brought about between them. Consequently M. CLÉMENTEAU's course is now plainly marked out for him. He has to supplant M. GAMBETTA, and he will have the support of his party in making the effort. At present, indeed, that support may not count for much, since the Extreme Left is not very much stronger in the new Chamber than it was in the last. But as regards M. GAMBETTA it will be a united party, and amid so much Parliamentary uncertainty union is especially valuable.

It may seem that when so many of the outgoing deputies have been returned, uncertainty is scarcely the word to apply to the action of the new Chamber. To say this, however, is to forget the complaint which M. GAMBETTA has so persistently urged against the Chamber which has just been in a great measure re-elected. In that also there was a Republican majority; the fault he found with it was that it was a majority which did not know its own mind, or appreciate the conditions under which alone it could make its will felt. It was a Republican majority, but not a Ministerial majority. The deputies who composed it were of one mind as to the institutions under which they desired to live, and as to the general direction which they wished the conduct of public affairs to take. But they had no clear idea of what they wished as regards the politicians by whom public affairs were to be conducted. They were alternately satisfied and dissatisfied with their Ministers, and watched their advent and their departure with equal complacency. It may be, of course, that M. GAMBETTA's own attitude has been the

cause of this indifference, and that, if he had been willing to take office, a Ministerial majority might easily have been formed. In that case, however, it is not very clear why he should so steadily have refused not, indeed, to take office, but to assume the Parliamentary position which must in a very short time have placed office within his reach. He would hardly have been so bent upon altering the grouping of the electors had he thought that, even grouped as they are, they could be made to give him the steady support he wants. The fact that only a very small amount of new blood has been introduced by last Sunday's elections is not, therefore, as it ordinarily would be, a reason for confidence as to the policy of the new Chamber. In so far as it is like its predecessor it will have no decided policy at all.

There is ground, however, for believing that many of the former deputies will return with their lesson better learnt than before. The line between the general body of Republicans and the extreme section of the party promises to be even less distinct than it was in the last Chamber. In the first place M. GAMBETTA and M. FERRY have done their best to efface it. M. GAMBETTA has committed himself to that revision of the Constitution which only three months before the election he had openly opposed; while M. FERRY's conversion was even more rapid. It is possible, indeed, that in this sudden change of front M. GAMBETTA had the Extreme Left in view rather than his own followers; and that, now that he has seen how impossible it is to recall the Extreme Left to his side, he will give up the attempt to conciliate them. On the other hand, whatever may have been his immediate intention, the fact remains that the majority of the Republican candidates went to the electors with M. GAMBETTA's new programme in their hands, and that the result has thoroughly justified them in so doing. The majority in the new Chamber has to all appearance been returned to support M. GAMBETTA in getting the Constitution revised, in administering the Concordat in the harshest possible spirit, and in subjecting the magistracy to needless, if not injurious, changes. The long desired division of the Republican party into Liberals and Conservatives, with the consequent dissociation of Conservatism from impracticable monarchical ideals, seems to be further removed than ever. In a Chamber of 557 members there will probably be less than a hundred non-Republicans. The changes in the composition of the majority have all been in one direction. Wherever an outgoing deputy has been rejected in favour of a new candidate, the substitution marks an advance in political opinion. A member of the Advanced Left has in almost every case replaced a member of the Pure Left, except in the few constituencies which have for the first time returned a member of the Extreme Left. It seems probable, therefore, that M. GAMBETTA will find in the new Chamber the homogeneous majority for which he looked in vain in the former Chamber.

This result will be in part due to the past errors of the Conservative party. They have lost no opportunity of damaging the cause they have professedly at heart, or of showing how lightly they value it by the side of their own special crotchets. They have been Legitimists or Imperialists first and Conservatives afterwards, and in a country such as France is to-day to subordinate Conservatism to dynastic considerations is to condemn it to certain impotence. The French people have made up their minds upon the question of institutions. They are Republicans, and they mean to remain Republicans. There is nothing to show, however, that they have yet made up their minds upon the question how the Republic shall be governed. The true policy of the Conservative party would have been to turn this indecision to account. One of the few moderate Republican deputies who has retained his seat—M. RIBOT, the editor of the *Parlement*—says, in his address to the electors, that what France needs is a Government sufficiently strong to resist all coalition of extreme parties, sufficiently master of itself not to run after adventures either at home or abroad, sufficiently bold to take in hand necessary reforms, and sufficiently patient to accomplish them without precipitation and without violence. In the new Chamber M. RIBOT will, perhaps, find a score of deputies who could have put their names to his address without inconsistency. Had the French Conservatives been alive to their own interest these are the doctrines they would have preached. Instead of this they have always been occupied in devising how to fix on the Republic the discredit of every

passionate and unwise measure which has been undertaken or advocated in its name. The organ of the Legitimists professes itself delighted with the result of the elections, because they have put an end to the artifices, the reticences, the subterfuges of those who call themselves Conservatives without at the same time calling themselves Royalists. \*That the Legitimists will number little more than half the deputies they commanded in the last Chamber seems to the *Union* as nothing by the side of the glorious fact that the Orleanists and the Conservative Republicans will be still fewer. This is not a temper which is likely to endear Conservative principles to a nation which seems at present determined that, whatever else fortune may have in store, it will not have the Count of CHAMBOARD to reign over it. A Conservative party within the Republican majority has to be built up without any aid from outside, and, with the indifference to politics which usually characterizes the French peasants, from whom the main support of such a party must come, this is not at all an easy process. There was a time when it seemed possible that M. GAMBETTA himself might head such a party, and show that respect for social institutions was not incompatible with devotion to Republican forms. To expect such a transformation from him now would be to make too large a demand even upon his versatility. One gain, however, may be expected with some confidence to follow from the fact that the very large Republican majority returned last Sunday regard M. GAMBETTA as their leader. He will hardly evade any longer the responsibilities and the sanctions which properly belong to the leadership of Parliamentary parties.

#### PRISONS AND COLLEGES.

IN the exultation on one side, and the apprehension upon the other, provoked by the final arrival into port of the big Irish ironclad, after its tedious voyage over chopping seas, the foundering of minor barques is, we fear, disregarded, however full of misery the calamity may be to sufferers worthy of a happier fate. A little Bill which passed the House of Lords unanimously under the title, picked up during its progress there, of Contumacious Prisoners' Discharge Bill, deserves a tear. The immediate cause of the measure was the fatuous violence—inconceivable even from that body—of the Church Association which chose not only to hustle into prison, but to sell up, a hard-working pastor, Mr. GREEN, for offences which the Association exists to prove are not among the weightier matters of the law. In 1840 a Mr. THOROGOOD, a martyr to conscience on the point of Church-rates, found his release by an Act of Parliament which allowed the prisoner, after he had suffered for six months in prison, to regain his liberty with the consent of the prosecutor. In their innocence the legislators of that day thought this provision amply sufficient, but the Church Association have now taught us better; so Lord BEAUCHAMP in his Bill proposed to drop that limitation. But then the pertinent question was asked How is Mr. GREEN to be kept from getting into prison again if he shall decline to conform to orders which he believes himself conscientiously compelled to disregard? Lord SELBORNE was equal to the emergency, and cut the knot by throwing the responsibility of future proceedings on the Bishop, with a reasonable confidence in the average discretion of the Episcopate. So the Bill went down to the Commons, and was duly blocked when it got there. At last, however, it came on upon Tuesday, when there was still time to have had it passed during this Session, had not an anti-Church Radical of the clearest grit, by counting out the House, extinguished Mr. GREEN's hopes of freedom for many months to come, except under the almost impossible contingency of a return to sanity on the part of the Church Association. So that body may at least enjoy its Christmas gambols in the consciousness that it has done more to help Ritualism than myriads of Church Unionists could ever effect, while Ritualists have leisure to appreciate the tender mercies in store for them under a régime of disestablishment.

For the failure of the other Bill, which was to have substituted the Universities Committee of the Privy Council for the two moribund and unsatisfactory Commissions, the Government have only to thank their own procrastination and want of candour. As the measure passed the House of Lords, that Committee was to step into office as it was—

thus every one imagined—and all the peers, from Lord GRANVILLE to Lord SALISBURY, accepted the Governmental proposal so interpreted without demur. As soon, however, as the measure reached the Commons, Mr. BRYCE, burning to win in the field of politics distinctions as bright as those which he has achieved as scholar and traveller, rebelled against his leaders. Impetuous Radicalism thereby created a difficulty, for the passage of the Bill through the Upper House had been achieved by engagements which no man of honour could forget. However, an arrangement seemed to have been reached by which two more Privy Counsellors were to be added, and the names which were whispered appeared to carry with them the promise of fairness, moderation, and an equitable balance of opinion. The Bill was read a second time, and got into Committee; and not till then was it unostentatiously hinted that, under the original Act, there was an unexhausted but practically obsolete power of appointing one more member of that Committee than had been named on its formation. This was startling; but it was a more uncomfortable surprise to learn that a strong suspicion existed that this power was to be exercised so as to destroy that balance on the faith of which the understanding had been reached, while the straightforward expedient of coming out with the third name was avoided. Not only so, but the Government had been so much too clever as to drive the reconsideration of the Bill by the Lords to yesterday, when there was no longer any time for the two Houses to come to an understanding. The result is, no doubt, delay in the work of University reconstruction, but for that delay the Government, and the Government only, is responsible.

#### REFORM IN VICTORIA.

**T**HERE seems to be an intermission in the experiments which the politicians of Victoria have been for some years trying as to the possible perversities of extreme democracy. In that colony universal suffrage, or the unqualified sovereignty of the poorest classes, has not been able wholly to counteract the advantages of a productive country and a temperate climate; but the constituencies and the demagogues who alternately led and followed them have, to the utmost of their power, fought against the tendency of the natural advantages which they enjoy. In a thinly inhabited territory the most valuable of all commodities is human labour; and the Victoria Legislature has systematically discouraged immigration. Artificial dearth has been as far as possible promoted by the imposition of heavy duties on imports, with the natural result of enabling a neighbouring colony, under a more rational policy, to advance in prosperity more rapidly than Victoria. More plausible excuses may be given for the heavy and exceptional taxation which is employed for the purpose of discouraging the formation or retention of large landed estates; but envy and jealousy had at least as much influence in the agrarian legislation of Victoria as any economic theory. Professor PEARSON, one of the most extreme of the democratic politicians of the colony, has openly avowed the doctrine that wages ought to be raised to, or maintained at, a high level by legislative measures, if the result is not secured by the operation of supply and demand. The dominant working class and its chosen representatives make in Victoria no secret of their intention to pay exclusive regard to their own supposed interests. It is true that in other countries landowners, capitalists, or traders, may have been equally selfish, though they have for the most part been less cynical in their disregard of the welfare of their neighbours; but minorities are held in check by the latent force of the great mass of the community. From the despotism of universal suffrage there is no appeal.

The most conspicuous popular leader in the colony is Mr. GRAHAM BERRY, who has for several years been principal Minister. Few demagogues have succeeded more fully in promoting political discord and in setting classes at variance with one another. He has almost always commanded a majority in the Assembly which is returned by universal suffrage; but many of his schemes have been thwarted by the opposition of the Second Chamber. The Legislative Council of Victoria is returned by the holders of a property qualification; and although there is nothing in the colony which resembles an aristocracy, the representatives of electors possessing a competence

are, as might be expected, more cautious in allowing changes than the more popular body. The collision which Mr. BERRY probably desired to precipitate arose under familiar conditions. All the Constitutions which are copied with more or less alteration from an English model confer on the Lower House the exclusive control of taxation and finance; yet even in the original system the respective privileges of Lords and Commons have never been strictly defined; and it has been contended that the Upper House has the right, as it certainly has the power, to reject a money Bill, though not to amend it. There is less doubt as to the competency of the House of Lords to refuse to pass any legislative measure which may be improperly included in, or, in the technical phrase, tacked to a money Bill. The little rift within the English constitutional lute perceptibly widens in communities where the Second Chamber has neither social weight nor traditional authority. Some years ago the Legislative Council of Victoria rejected a Bill by which the House of Assembly had provided for the payment of its members. Mr. BERRY and his colleagues asserted that the measure was simply a grant of money; and the Council replied that the payment of members involved an important political issue. The contest was continued in many successive Sessions in varying forms, with the redeeming feature that both parties affected to rely on English precedents. A student of English history, such as Professor PEARSON, might have informed his fellow-colonists that the English Constitution would have long since proved impracticable, if contending parties had insisted on their extreme claims; but the popular leaders in Victoria were bent on inflaming rather than on appeasing political differences.

The Governors who represented in the colony the titular supremacy of the Crown were, with one exception, neutral; and it was scarcely of deliberate purpose that Sir GEORGE BOWEN appeared to favour the pretensions of the Assembly; yet neither scrupulous regard to colonial independence nor questionable conformity to the policy of the agitators prevented the attacks on the mother-country in which colonists indulge with certain impunity. Some patriotic orators threatened to put the GOVERNOR by force on board ship, and to deport him from the colony. Rhetorical threats of secession only subsided when it was found that the colony might at its pleasure throw off its allegiance. The tie which unites the centre of the Empire with its dependencies has, since the institution of responsible government in the colonies, become so elastic that it is in little danger of breaking. There is scarcely a greater pleasure in addressing seditious speeches to a Government which never interferes than in blaspheming the gods of EMIGRES. In neither case is there any avenging thunderbolt to dread. From impotent declamation against remote and conventional authority Mr. BERRY and his friends were obliged to concentrate their power of annoyance on their local antagonists. At one time the Minister refused to pay the salaries of the judges and the principal civil officers on the pretext that the Council had rejected a Budget which was in fact encumbered with a tack. Mr. BERRY also devised various schemes for amending the Constitution which he had entangled in a deadlock; nor was the Legislative Council indisposed to facilitate changes by which it might expect to acquire popular influence. Its proposal that both the franchise of the electors of the Council and the qualification of its members should be reduced was scornfully rejected by the Minister, who desired not only to diminish its authority, but to relieve himself from all constitutional opposition. One of his most audacious demands was that the Council should cease to be elective, and that it should be nominated by the Crown. It was, of course, understood that the Crown meant the Governor, that the Governor meant the Minister, and that the Council would, therefore, be appointed by Mr. BERRY himself. Although he and his partisans often threatened bloodshed as the alternative of compliance with their demands, they probably found that the multitude which applauded their turbulent policy was not prepared to engage in an unnecessary civil war. It is also possible that the unanimous disapproval of the respectable inhabitants of the colony may have exercised an unconscious influence on even the wildest demagogues.

As violence seemed to be undesirable or impracticable, while the Council was not likely to concur in abolishing itself, Mr. BERRY fell back on the paradoxical scheme of inducing the Crown to remodel the Constitution which it

had originally granted. The Council, perhaps for the sake of a trial, sanctioned a vote by which the Assembly made liberal provision for a mission, consisting of Mr. BERRY and Professor PEARSON, to appeal to the Home Government. Sir M. HICKS-BEACH, the Colonial Secretary, judiciously temporized with the deputation, and ultimately declared that the extreme case in which the intervention of the Crown might, perhaps, be allowable had, in his judgment, not yet arisen. The delegates were, therefore, advised to solve the question in the colony by compromise; and it seems that, through a change in political feeling, a settlement of the dispute has at last been accomplished. Mr. BERRY and his faction found on his return that his hold on the Assembly was shaken; and, after a time, his opponent, Mr. SERVICE, succeeded to his office. One of the most obnoxious parts of the scheme which Mr. BERRY had submitted to the Colonial Office was the outlandish device of a popular vote or plebiscite on occasions when the Council and Assembly found it impossible to agree. Even in Victoria the virtual abolition of Parliamentary or representative government appears not to have been generally acceptable; and certain novelties included in a project by which Mr. SERVICE sought to solve the difficulty were also thought objectionable. Mr. BERRY afterwards resumed office; but he has lately been left in a minority; and it is understood that the Council and Assembly will agree on an arrangement involving the reduction of the franchise and qualification. It is not known whether the supremacy of Mr. BERRY's party has been permanently disturbed. The Assembly which he has long ruled consists of members for the most part of humble origin, of imperfect education, and of manners such as those which have recently been obtruded on the notice of the House of Commons. It is possible that such a legislative body may become tired of a once favourite leader, and the fall of Mr. BERRY would be an unmixed advantage to the colony. His successors may perhaps be less ambitious and less active in devising and perpetrating mischief, and it is possible that through the example of New South Wales sounder economic views may gradually supersede the existing delusions. If the Council, in consequence of the proposed change in its constitution, acquires additional power, a wholesome check may be imposed on the caprices and blunders of universal suffrage. The Imperial Government may congratulate itself on the practical independence of a colony which would probably rebel against any external control.

#### FIRST FRUITS OF THE LAND BILL.

IT was perhaps natural that Sir RICHARD CROSS, speaking to the Lancashire farmers on Wednesday, should decline to say more than he could help, alleging the intolerable amount of talk which he had lately had to submit to, and the satiety of speech which had consequently come upon him. But if the late Home Secretary could find nothing to say about agricultural depression except to congratulate the farmers of the North on the advantages of their position as compared with the farmers of the South, and to pay farmers generally a well-deserved compliment on the stout heart with which they have met the stiff hill of their troubles, others have not been so reticent. Mr. GLADSTONE'S guarded, but significant, acknowledgment of the importance of the English land question has been taken as a cue by his supporters in the press, and they have begun to enlarge on the necessity of Land Reform if the farmer is to get over his woes. It is, perhaps, rather amusing to remember how short a time has passed since these same persons were elaborately reassuring halting supporters of the Irish Land Bill by pointing out that the cases of England and Ireland were so different that nothing that was done in the one case could by any possibility be taken as a precedent in regard to the other. The passage of the measure has done away with the necessity of this argument, and it is conveniently forgotten. It is discovered that the cases of England and Ireland are very much alike. The English tenant, like the Irish tenant, complains that he cannot get along, and the obvious way to help him to get along is in some way to cut him a comfortable slice out of his landlord's property rights, if not exactly out of his landlord's property. Indeed, with a fertility of resource which is not altogether common, the very argument that was used most strenuously for the advantage of the Irish tenant is now being used, with a "not" taken

out of it, for the benefit of the English tenant. It contended that the Irish landlord's rights must be cut down because he does not make the improvements; it is now contended that the English landlord's rights must be cut down because he does. "A farm improved and virtually created by another's capital offers no temptation to a tenant to cultivate it at a loss." It is certainly true that a farm, no matter how it be improved, or virtually created, offers very little temptation to any one to cultivate it at a loss; but the conclusion intended to be drawn, at least logically, from this remarkable premiss, does not appear. Unless, indeed, it be contended, as some people would have liked to contend in the Irish matter, that the higher the rent the tenant has to pay, the greater his grievance, whether the money represents money's worth or whether it does not.

The immediate occasion for these curious specimens of reasoning has apparently been a reported meeting of a considerable number of Aberdeenshire farmers, who have demanded alterations in the Land Laws and the condition of land tenure. It may be observed, and all who know anything of Scotch farming will endorse the observation, that from no class of agriculturists could any such demand come with worse grace. Scotch farmers, and especially farmers in the East of Scotland, have as nearly their own way with other people's property as the residence of any rights of property in the actual owner will allow. Their regulation nineteen years' leases are long enough for them to outlive any ordinary series of bad seasons and to get out of the land every farthing which, with any skill or judgment, they have put into it—a process of recovery, not to say exhaustion, which, unless they are belied, they very rarely fail rigorously to carry out. Their rents are seldom high, for the competition of solvent tenants is not very great, and few landlords are rash enough to hand over their land for so long a term of years to a tenant who is not pretty notoriously solvent. They are freely compensated by law for some damages against which in England the tenant would have little redress unless from the bounty of his landlord. In certain districts, and in consequence of the competition of the banks for custom, the smaller farmers are indeed dangerously far gone in credit, but that has nothing to do with the landlords. Lastly, the old grievance of hypothec has ceased to trouble them. If, therefore, Scotch farmers cannot get on, and demand, as these farmers are said to do, a general revaluation of rents, their demand amounts to neither more nor less than a simple demand for the redistribution of property. It would be exactly as reasonable for them to meet together and demand legislative interference to make the banks reduce their rate of interest. The landlord lends the land to the farmer to cultivate, the bank lends him the capital to cultivate it with, and the interference with the amount charged by both for the accommodation is on exactly the same footing. In the Irish case the fortunate discovery of the joint-proprietorship of the occupier helped the innovators out of this difficulty. But, putting the Highlands aside, even Radical invention may well shrink from attempting a similar find in England or Scotland.

It is, however, rather interesting to consider the attitude of the less extreme English Radicals towards these demands. They have not yet gone so far as to advocate the compulsory lowering of rent. It is from the Land Laws that the farmer may, according to them, be justly relieved. Now this expression—the Land Laws—frequently as it is used, is, for the most part, used without the least self-examination as to its meaning, and the knowledge of that meaning possessed by the speaker. If it were said that there were no Land Laws in England, the statement would doubtless be too sweeping; but it is certain that the legal provisions which even remotely affect the occupier of land are extremely few; and it is equally certain that their effect is grossly exaggerated. The intricacy of titles, the custom of primogeniture, the existence of life-estates, the absence of security to the tenant for his improvements, and the law of distress, pretty nearly sum up the list as it is presented even by the most industrious advocates of reform. Of these the law of distress is admittedly rather a sentimental than a practical grievance, inasmuch as landlords are not in general lunatics, and are exceedingly unlikely, in their own interest, to distress when they can possibly avoid it. Except the reckless demagogues who speak of primogeniture as if there were a law enjoining upon every landowner to leave his land to his eldest son,

no one affects to see in that custom anything but the carrying out by the law, in a case of presumable oversight, what, by an equal presumption, was the owner's intention. Few people are less likely to rejoice in the intricacy of titles than landlords themselves; and, if any one would point out a way to solve the difficulty, which no one has yet done with any success, it is scarcely likely that opposition would come from them. Compensation to the tenant for improvements made judiciously, and with his landlord's consent, is already recognized in exactly the same way as primogeniture or life-tenure is recognized—that is to say, permissively. There is, therefore, nothing left but the actual prohibition of life-tenure; and if any one with an actual knowledge of the subject seriously, and not for a mere political purpose, argues that this would counteract the effects of bad seasons, foreign competition, altered modes of life on the part of all classes, emigration, concentration of the population in towns, exhaustion of the soil, and all the rest of the conditions which make against the farmer, his faculty of persuading himself of what he wishes to believe may be admired at the expense of his reasoning powers. A more singular specimen of the MORISON'S pill remedy has rarely been known even in Radical programmes. It is supposed that, if limited ownership were abolished, owners would sell part of their land in order to improve the rest; it is supposed that in this case the price of land would fall; it is supposed that, if the price of land fell, small and moderately large capitalists would hasten to invest in it, and would not, as in such cases they have invariably done, rackrent their purchases, but would cultivate them themselves. Against every one of these hypotheses cause of the gravest kind can be shown; and yet, if all of them were granted or proved, agricultural prosperity would not necessarily or even probably follow. Yet this is all which the more moderate aspirants after "free land" have to promise to those who listen to them. Considering the amount of interference with property, custom, and society which the programme involves, it could scarcely be more modest in the corresponding advantages which, even on its own showing, it offers. The agitation, the beginnings of which have been so fondly welcomed in certain quarters, will, no doubt, become more enterprising in time; and something not much less remarkable than the discovery of the Irish tenant's property in his holding may, after all, reward ingenuity before long. There are indications that the farmers may after all be left in the lurch by their Radical friends, whose innovations would then be directed to acquiring the support of the more numerous and less intelligent class of labourers.

#### EGYPT.

THE Report of the Egyptian Daira recently published is full of interesting matter, both as regards the vast estates managed by the Council of the Daira under the control of the Government, and on account of the light thrown by it on the general state and prospects of Egypt. Much space is necessarily taken up with an account of the long series of legal and provincial difficulties which have just been brought to an end by the provisions of the Law of Liquidation and the intervention of the Government. Now, for the first time in its mournful and tangled history, the Daira has a clear start, is freed from embarrassment, and can fairly show the results of the joint management of natives and foreigners. In one way, however, the Daira stands by itself, for it is principally occupied with the production of sugar, and sugar is not an ordinary, nor is it a natural, product of Egypt. The climate is not hot enough for the cane to give its full yield. Still, sugar realizing good prices in the European market may be grown there, and is grown on the Daira lands. The general result if a normal year is taken, and no expenditure is brought into account beyond that which the enterprise, if free from debt and litigation and well managed, ought to have thrown on it, shows incomings and outgoings which balance each other so nearly that a very trifling deficit need not be noticed. In round figures it may be stated that the Daira has an income of 1,200,000*l.*, and that it is worked at a cost of 50 per cent. Out of the 600,000*l.* thus remaining, no less than 230,000*l.* is paid for taxes to the Government, and nothing could show the natural wealth of Egypt in a

more striking way than that cultivators can cultivate to a profit and yet hand over a fifth of the gross produce to the State. The remaining 370,000*l.* suffices to pay 4 per cent. to the bondholders. This is a very small return, but the capital on which interest has to be paid was wildly manipulated by the late Khedive, and is very largely in excess of what was necessary to put the undertaking in working order. Even if the estates of the Daira had to be bought at the greatly advanced prices which land in Egypt now commands, while the sugar factories were established with proper skill and economy, the return on the capital employed would be at least double what it is at present. How much the price of land has recently advanced the Daira has itself lately proved to its great advantage. It has numerous outlying estates which it cannot itself manage properly, and portions of which it is selling off as opportunity offers. It only sells in small lots suited to the occupation of the inhabitants of contiguous villages, and it finds that there are always villagers ready to buy who pay ready money, and never give less than the capital represented by an income of 5 per cent. The villagers, it may be presumed, generally borrow the money they pay; but the vast amount of foreign capital recently poured into Egypt enables them to borrow at a rate sufficiently low to make their venture profitable. The eagerness of the cultivator to make use of all the land he can get hold of, and also the obstacles which he has to encounter, are also shown by the recent history of some of the lands of the Daira in lower Egypt. These lands, which had long been lying idle, were let to peasants, who were to reclaim them, and were for some years to pay a very low rent. There were numbers who caught eagerly at the offer, and began, with high hopes and much energy, their humble operations. But the Government immediately imposed taxes, before the land had begun to yield any return; and these taxes were so high that the cultivators had to throw up their land in despair. Sooner or later the Government will see that it is thus killing its golden goose, and that it is depriving itself of revenue that would flow in if taxes were imposed with more prudence and moderation. But the habit of taxing blindly, so as to get something out of everybody, whether it can or cannot be paid without ruin to the taxpayer, is so ingrained in Egyptian Governors of all ranks that it will be long before the needs of the Government are supplied in the way most advantageous to those who supply them and to the Government itself.

The Report of Mr. COOKSON, the English Consul at Alexandria, tells the same story for the country at large of the rapidly increasing prosperity of Egypt, and at the same time it shows how this prosperity may have its results diminished by bad seasons, to which Egypt is as liable as countries with a less favourable climate. The sugar-canes on the Daira estates were nipped last year by a frost severe beyond all Egyptian experience. This was a rare calamity; but Egypt is always exposed to the evils attendant on the rise of the Nile being too great or too small. Owing to the unfavourable weather and to a low Nile many of the high lands failed to produce a wheat crop last year, and the total export of wheat was 25 per cent. less than in 1879. The cotton, too, was 16 per cent. less than in the year before, and of inferior quality. But, on the other hand, owing to the easy circumstances of the cultivators and their desire to hold stock, the crop of 1880 came very late to market, and the stock in store was larger than in any previous year. That the peasants should be able to hold their crop and wait for a rise in the market is a more significant proof of their growing comfort than a larger amount to export could have been, as that might have been merely due to the chances of the season. The total value of Egyptian exports amounted to upwards of thirteen millions sterling, falling short by about half a million of the total for 1879. The direction of Egyptian trade is shown by the fact that more than three-fourths of the exports were to England, and more than half of the total imports of Egypt came from England. The imports of 1880 largely exceeded those of 1879, and Egypt was able to pay for the excess, although she had not more, but rather less, to export, partly because the interest payable on the debt to foreigners was considerably reduced, and partly because foreigners provided her with the money that was wanted. The increase of imports was, to a large degree, in coal, iron, and machinery needed for the purposes of agricultural improvement, and the purchases of machinery were mainly

made by the peasants themselves through the agency of the various banking establishments which have rapidly sprung up, and supply so much capital that the competition is now to find borrowers, not lenders. A very considerable increase in the consumption of cotton and woollen goods, supplied, the former almost wholly by England, and the latter principally by Austria, indicates that the population is able to clothe itself better as it gets on in the world. That Austria should be able to eclipse England in providing woollen clothing for Egyptian labourers is deserving of notice; but it is not only in woollen goods that imports from Austria are increasing, the total having doubled itself in four years. From Italy Egypt has taken little more than a fourth of what she has taken from Austria, and the exports to Italy last year were only half what they were for the year before. The trade of France with Egypt, though vastly inferior to that of England, somewhat surpasses that of any other country; and, although the joint protectorate of England and France is justified by political and not by commercial reasons, it is not without importance that the two protecting nations take the lead in the commerce of Egypt.

While in this way the reports both of the Daira and of Mr. COOKSON show that Egypt is growing rich, there is good ground for anticipating that Egypt may grow much richer as time goes on. It is a country in which public money judiciously expended ought to produce large returns. Fertile as Egypt is, there are large tracts which might be made much more fertile, or which now lie waste and might be reclaimed, with an extended system of irrigation. The main estate of the Daira, for example, is traversed by a canal which is at present very imperfect and confers few of the advantages on the cultivators which it was constructed to give them. Like most of the undertakings of the late Khedive it had a magnificent beginning, but was never more than half carried out. If the canal could be properly finished the revenues of the Daira might be largely increased, and unless the canal is finished there is very little probability that good management can do more than keep these revenues at about their present level—sometimes higher in good seasons and sometimes lower in bad seasons. The Government has recently promised that with the first money at its command it will do what is necessary for the canal, and the Government may reasonably expect to have money at its command before long. The revenues now do more than provide for the ordinary administration and for the service of the debt. We are taken into the region of politics if we ask how long this happy state of things is likely to continue. It will be maintained as long as the joint protectorate works, and works well. It will cease, or, at any rate, its course will be arrested, if there is any serious hitch in the working of the protectorate; and this hitch may come either from an interruption of the friendly relations of England and France, or from an attempt on the part of the ruler of Egypt, whoever he may be, to shake off the protectorate. The prosperity of Egypt in one way constitutes a danger to the country. The Viceroy may urge that a thriving and peaceful country does not need the supervision of foreigners, that the days of tutelage are past, and that the Egyptians may fairly claim to be left to manage their own affairs. Such an appeal is not likely to be made at present, and would certainly be discountenanced if it were made; but there are conceivable changes in the politics of Europe which might permit it to be made with some chance of success. If Egypt was left to the Egyptians the country would in all probability go backward as rapidly as it is now going forward.

#### DECOYING.

THE Select Committee of the Lords appointed, on the motion of Lord DALHOUSIE, to "inquire into the state of the law relative to the protection of young girls from artifices to induce them to lead a corrupt life," has reported that the matters referred to them need a "much fuller and more prolonged consideration" than can be given to them in the present Session. The evidence already taken is abundantly sufficient to show the need there is of amending the law. Upon this point it can hardly be said that any further testimony is wanting. Indeed, before the Committee was appointed it was plain that the practice of "inducing English girls to become

"inmates of Belgian brothels"—Mr. Justice STEPHEN'S plain language seems preferable to the extraordinary circumlocution adopted in the order of reference—cannot be adequately, if at all, dealt with by the law as it stands; and that, as a consequence of this impotence on the part of the law, the practice has, or had "until lately, become exceedingly common. Mr. SNAGGE'S Report to the HOME SECRETARY placed the existence and methods of the trade beyond doubt. The proceedings of one KLYBERG, who has been employed in the business for some twelve years past, are there set forth in the most authentic possible form—that of extracts from his correspondence. The letters from which these passages are taken were found by the police in houses of ill-fame at the Hague and at Antwerp. They are just what might be written by an exporter of ornamental goods. In one, he says that the price for "several beauties" whom he "has to dispose of will be 150 francs per package (*colis*) here, or 300 at Ostend." In a second he reports the proceedings of a dealer who "arrived at noon, and at six o'clock left again for Ostend with two packages, for which he paid 300 francs." In a third he sketches his plans for the future. Several people have asked him for "packages," and he intends to be his own agent, and to travel constantly. In another he urges his correspondent not to miss the fine opportunity he offers him, for "one does not find such a package every six months." KLYBERG has not been uniformly fortunate, for in 1877 he was convicted at Rotterdam, and sentenced to two years' imprisonment. But in the autumn of 1880 he was at his old trade, for in a letter which came into the hands of the English police, he offers to bring two "packages" to the Hague for 300 florins. He is now supposed to be living in the Netherlands. Several other persons—both men and women—are mentioned by Mr. SNAGGE as engaged in the same traffic. A Frenchman, calling himself COURTNEY, has been accustomed to take over girls from England to various Belgian and Dutch towns. Another man, who signs himself "ALBERT, Coiffeur," and who lives in some street near Loicester Square, writes to the keeper of a brothel in Brussels "in order to enter into business relations" with her to know whether she would wish to be supplied with "English packages." The recent trials at Brussels disclosed similar facts about five dealers. The chief of these, one SELLECART, lived in London with a woman who picked up young girls, SELLECART'S share in the transaction being confined to taking them to the Continent, placing them in the hands of the keepers of the brothels, and receiving the price for them. Several letters from this woman are given, in one of which she assures her correspondent that she is much more careful to "fulfil the necessary formalities" than KLYBERG was. In some of these cases the girls know generally the purpose for which they are taken abroad; but a large number of girls are induced to go by the promise of some employment—usually as a barmaid or actress. A principal reason for importing girls from England seems to be the ease with which they can be got young. In France, Belgium, and Holland the registration of a woman as a prostitute under twenty-one years of age is forbidden. But as younger girls are found more attractive and more manageable, it is an object with the keepers of brothels to obtain them. Abroad it is apparently not easy to obtain a false certificate of age. But in England a certificate of anybody's age can be obtained for 3s. 7d., and the custom is for the dealer to go to Somerset House, obtain a certificate of some girl's age who is over twenty-one, and then present this to the Belgian police as proof that the girl to be registered is over twenty-one. In theory, of course, the girl can protest at the time of registration. But she is ignorant of the language and of the law, has usually no very strong moral objection to the life she finds that she is intended to lead, and so, half against her will and half with her own consent, finds herself a virtual prisoner in a foreign country. Mr. SNAGGE is of opinion that the existing law is inapplicable to these cases, partly from the difficulty of proving that false pretences have been used to entice the girl away, and partly from the fact that the offence is completed beyond the jurisdiction of the English Courts. Mr. Justice STEPHEN is "by no means sure" that the law, as it stands, provides no punishment for conduct such as KLYBERG'S and SELLECART'S. But he thinks that it is so doubtful whether it does so that the matter ought to be dealt with by the Legislature. He makes, however, one suggestion which the adjournment of the

inquiry has made specially valuable. It is that, if legislation on the subject should be impracticable during the present Session, it would be desirable, if possible, to institute a prosecution under the 24 & 25 Vict. c. 100, s. 49, in order that the scope of the existing law may be judicially determined. When there is no probability of the law being altered, it may sometimes be inexpedient to test it to the full, lest it should break down, and give the encouragement which comes from proved impunity. But where the Government is prepared to introduce an amending measure, it is important to know precisely where the existing law is inefficient, and needs strengthening.

There is another matter which is only incidentally dealt with in the evidence here brought together, but which, when the Committee resume the inquiry, will, it is to be hoped, be given a prominent place in the legislation they may recommend. Englishmen are not in a position to throw stones at foreigners. The licensing of prostitution has many evils connected with it; but there is an evil existing, and existing without any practical check, in London which far exceeds anything that can be charged against foreign systems. The evidence of Mr. HOWARD VINCENT, the Director of Criminal Investigations, and of Mr. DUNLAP, the Superintendent of the St. James's Division of the Metropolitan Police, is not pleasant reading for any of us, since we are all in some remote sense responsible for the things described in it; but it deserves the most careful attention. Mr. VINCENT gives it as his opinion that there is no city in Europe where juvenile prostitution—the prostitution, that is, of children of thirteen and the years immediately following—prevails so largely as it does in London. Mr. DUNLAP carries the age a year lower. “I should be quite within the bounds of prudence in saying ‘that there is a great deal of juvenile prostitution as young ‘as twelve years of age.’” We cannot quote the particulars which the Superintendent gives in confirmation of his statement, but they are amply adequate to support it. More than this, Mr. DUNLAP states that the thing is new. He has been thirteen years in the St. James's Division, but the prostitution of these very young children has only come under his notice within the last two years. There is a fashion in vice, and just now it runs in this direction. That cannot be helped; but what can be helped, but is not at present helped, is that the law should offer no impediments to the fashion. The police at present have no power to deal with it. They see children soliciting prostitution in the streets, they know the houses they frequent, they find them there if they have occasion to enter them for any other purpose; but as regards the children themselves they can do nothing. By the side of this shameful evil, the mere unsavoury condition of the streets is a trifling matter; but it does not seem a very creditable state of things that a high police authority should be able to say that “from three or four o'clock in the afternoon ‘Villiers Street and Charing Cross Station and the Strand ‘are openly crowded with prostitutes, who are there ‘openly soliciting prostitution in broad daylight’”; that, according to a calculation made some time ago, there are at half-an-hour after midnight “five hundred prostitutes ‘between Piccadilly Circus and the bottom of Waterloo ‘Place,’ and that the police, as the law now stands, are entirely powerless to deal with this nuisance.

#### THE SESSION.

AS was foretold in the Queen's Speech, the labours of the Session have been more than usually arduous. Parliament met in the beginning of January, and has sat almost into September. It has worked for whole days, it has gone through continuous nights of debate, and a docile majority was always at hand to vote as it was bid. But the Irish Land Act and the measures which made it possible to bring it forward have absorbed the whole attention of the most laborious of Legislatures. All the other measures foreshadowed by the Government at the opening of the Session have been abandoned. A Bill for introducing some scheme of county government into Ireland, even the outlines of which were never revealed; a Bill for giving a permanent shape to the Ballot Act; a Bankruptcy Bill; and a Bill to restrain corrupt practices at elections were promised only to disappoint the hopes of those who have long looked for some fragments of indispensable legislation. This time there has been no jostling of omnibuses in Temple Bar. The road has been kept for a solitary vehicle, which has been retarded by nothing but its own weight and by the friction it inevitably caused. The first complete Session of Mr. Gladstone's second Ministry has been absorbed in the passing of a measure of which neither he nor any of his col-

leagues dreamt when they took office. There were acknowledged to be from twenty to thirty great measures which the Liberal Government had to pass if it was to do justice to itself; but no Irish Land Bill figured in the list. The order of things is not as man proposes, and the whole force of the Ministry and its majority has been concentrated on a measure which at the date of last year's dissolution would have seemed as extraordinary and as uncalled for to the Government as to its opponents. And as the Session has been a Session of one Bill, so it has been a Session of one man. Mr. Gladstone has been everything and done everything. Never in the prime of life and the apparent fullness of his energy has he been so energetic, so copious in resource, so subtle in distinction, so thoroughly master of his subject, so varied in the compass of his rhetoric as in this Session of his old age. His leading opponents, with the generosity which characterizes the higher public life of England, have joined with his followers in expressing their admiration at his devotion to the oppressive duty he had imposed on himself, at his grasp of intricate details, at the inexhaustible ingenuity with which he reconciled his contradictions when he contradicted himself the most. He alone made the Bill, he alone understood it, he alone knew when the drafting of the Bill was right; and, as he was the only critic of the Bill whose criticism was tolerated, he alone could say when the drafting was wrong. He at last became so indispensable that, if he went away to eat a hurried meal, the Bill was at a standstill. As an intellectual feat, as a rhetorical feat, as a feat of Parliamentary direction, the conduct of the Bill by Mr. Gladstone has been as unique as the Session in which the Bill was passed, as the Parliament which passed it, or as its own wonderful self.

Parliament met on January 6th, and the discussion on Ireland, Irish difficulties, and Irish remedies began on the first evening of the Session. It took the House of Commons exactly a quarter of a year to get to the Irish Land Bill, and a little more than a quarter of a year to get through it. Before the great measure of healing could be brought forward, it was necessary to introduce some semblance of government in a country where, as was officially stated in the Queen's Speech, an extended system of terror had paralysed the exercise of private rights and the performance of civil duties, where the ordinary law had failed, and new powers were necessary to protect life, property, and freedom. A Coercion Bill and an Arms Bill were the necessary precursors of a Land Bill, but between the Government and the passing of these Bills there stood the grievous obstacle of Irish obstruction. Exactly a fortnight was consumed in the debate on the Address; and, after the House had closed a wearisome and most unproductive debate on Mr. Parnell's amendment declaring coercion unnecessary, it had to go through the tedious task of discussing and rejecting a wild proposal of which Mr. McCarthy was author, to the effect that the ordinary forces at the command of the Executive ought not to be used to carry out the judgments of courts of law. On January 24th Mr. Forster brought in his Coercion Bill; and the next night Mr. Gladstone moved that this Bill and the Arms Bill, which was to follow, should have precedence over all other Bills. It cost the House a continuous sitting of twenty-two hours to carry this motion, although ultimately only 33 members voted against it. The debate on the first reading of the Coercion Bill was virtually a prolongation of the debate on the Address. Mr. Forster had no difficulty in making out his case, as the outrages in the last quarter of the preceding year had been double the number of those in the first three quarters, and the insufficiency of the ordinary law was illustrated during the course of the debate by the acquittal of the traversers in the Dublin prosecution. Lord Hartington denounced with frank vehemence the miscreants who were troubling the peace of Ireland, and Mr. Bright announced that he had been convinced of the necessity of coercion by finding that the Land League had demoralized the people. The Opposition, represented especially by Mr. Gibson, naturally reproached the Government with the tardiness of its resort to extraordinary measures, but warmly supported the measure which the Government had declared to be necessary for the reintroduction of something like law and order. Mr. Parnell, in the early days of the Session, had spoken with a moderation, and even humility, which strangely contrasted with his language outside the House, although he subsequently assumed the curious position, as Sir Stafford Northcote pointed out, of an equal of the Queen, and of pronouncing when, in his opinion, an Irish insurrection ought or ought not to break out. When the final great battle of wanton, senseless, insolent obstruction was fought out, he and his followers showed that they believed that the game was theirs, and that they had only to speak on and on, saying the same wearisome things in the same wearisome way, to paralyse the English Parliament and bring it into deserved contempt. All one night, all the next day, and all the next night, they went on defying the majority, talking merely to win by talking, and determined to beat down, not so much the Ministry as Parliament itself, by sheer insolence and bravado. How long this disgraceful scene might have been protracted it is impossible to say, for it was brought to an abrupt end. Suddenly the Speaker appeared and desired the Irish member who happened to be the obstructionist of the moment to sit down, and, declaring that he would allow no more discussion, put the question of the first reading to the immediate decision of the House. The highest authority of the House had come to its rescue.

The summary blow thus dealt to Irish obstruction was followed

on the same day by the arrest of Davitt, a convict with a ticket-of-leave, who was specially dear to the obstructionists from the peculiar vehemence of his reditious language. On the next evening, accident rather than design relieved the House of all the obstructionists in a body. One of them was declared out of order by the Speaker; the rest, scarcely understanding what was happening, refused to obey his directions, and some and all were suspended from the sitting and forced to leave the House. Advantage was taken of this happy advent of temporary tranquillity to pass a resolution that when a Bill was declared urgent by a majority of three to one in a House of 300 members, on the proposal of a Minister of the Crown, the powers of the House for the regulation of all business connected with the Bill should be in the hands of the Speaker. The second reading of the Obstruction Bill occupied only a reasonable amount of time; but when the Bill had been in Committee for upwards of a week, the Speaker saw that, if the debate was to come to an end, he must use the exceptional powers given him by the House; and he instituted a rule which, in the shape it took after the leaders of both parties had been consulted, provided that, on the motion of a Minister of the Crown, supported by a majority of three to one, the House might fix an hour after which all amendments and new clauses in Committee should be voted on without discussion. This new weapon overcame obstruction. The Bill was reported in two more sittings, and in two more the third reading had been taken, and the Bill passed the Commons, which had been continuously occupied with it for more than a month. On March 1st Sir William Harcourt, in the absence of Mr. Forster, brought in the Disarming Bill, for which urgency was asked and obtained, and which, under the operation of the new rule, was got through in the moderately short space of ten days. By this time, however, the middle of March had been reached; it was indispensable that votes in Supply should be taken before the end of the financial year, and Mr. Gladstone proposed that Supply should be declared urgent. Sir Stafford Northcote, in a letter to his constituents, pointed out the danger or inconvenience of the precedent, and Mr. Gladstone's motion for urgency was not supported by the requisite majority. But it was soon apparent that no obstruction, or even delay, was to be feared. The Opposition gave every possible assistance to the Government, and the Irish faction was silent. Mr. Gladstone learned to speak of obstruction as of an evil dream that had passed away. At no subsequent period of the Session was urgency asked for; and when, on one occasion, a discussion arose on the forms of the House, and Lord Hartington expressed an opinion that some day the cloture, in some form, would have to be adopted, he was speaking, not of obstruction—that is, an abuse of the forms of the House—but of defects in the mode in which the House ordinarily conducts its business, which is a totally different thing. Obstruction, after an enormous waste of time, and through the courageous intervention of the Speaker and the ready action of the whole House, except an insignificant fraction, had been overcome. The reform of the procedure of the House, if it can be reformed, is left to the future; and the Government that undertakes the task will have as difficult a problem to solve as the most energetic and resolute of Governments could wish for.

Mr. Gladstone brought in the Land Bill on Thursday, April 7th. With all his mastery of the subject, and his unrivalled power of exposition, he failed to make intelligible to his hearers the details of a complicated and intricate measure. He spoke on the eve of the Easter holidays, and rather more than a fortnight was allowed for Parliament and the country to consider it. But no study sufficed to do more than to reveal the main outlines of the Bill. Its leading provisions dealt with relations of tenants to landlords during the continuance of the tenancy. The tenant was to be allowed to ask that a fair rent should be fixed for successive periods of fifteen years, and to sell at any time his interest in the holding, the landlord having a right of pre-emption and of objecting on specified grounds to the purchaser. If the tenant did not take the initiative, and the landlord raised the rent, the tenant might apply for a judicial rent, accept the result, and be thereby put in the position of having a fixed rent for fifteen years, or he might elect to go, and then either sell his tenancy, and receive in addition a sum imposed on the landlord as a penalty for raising the rent, or claim compensation for disturbance on a scale increased beyond that of the Act of 1870. If the landlord had land in hand or got land into his hands by eviction or purchase, a tenant to whom he might subsequently let was to be called a future tenant, and have the other advantages of the Bill, but not that of applying to have his rent fixed. Subsidiary provisions were introduced for promoting the creation of occupying owners, as well as reclamation and emigration, and the carrying out of the scheme was entrusted to a new Court or Commission. It was obvious that the Bill gave the tenant something undistinguishable from fixity of tenure and something almost approaching to free sale, and gave him in the most positive terms a means of getting a fair rent fixed. As there was to be fixity of tenure at a fair rent, and as what the tenant had to sell was the right of holding at a fair rent, the meaning of a fair rent was the key to the Bill. Here the Bill was hopelessly obscure. So far as the English language can serve as a guide to the language of Parliamentary drafting, the Bill seemed to lay down that a fair rent was to be ascertained by deducting from the amount a solvent tenant would pay, after tenants' improvements had been taken into account, a sum representing what the tenant who was not in any way being disturbed would have got if he had been disturbed.

This seemed monstrous, and yet if the clause defining fair rent did not mean this, what did it mean? During the long debate on the second reading, which began on April 25 and ended on May 19, this question was repeatedly asked by the Opposition, and with especial force and clearness by Mr. Gibson, but was never answered by the Government. Mr. Forster assured the House that the clause did not mean what it seemed to mean, but what it meant he could not or would not say. The division was taken on an amendment proposed by Lord Jelicho, which amounted to a vehement general condemnation of the Bill, and the majority for the Bill was exactly double the minority (176) against it. Mr. Parnell and his followers did not vote, and only seven Irish members voted against the Bill, while thirteen Irish Conservatives voted for it. After such a manifestation of Irish as well as English opinion it was evident that an Irish Land Bill had become a political necessity. But the task of getting the Bill through Committee in any reasonable time seemed almost hopeless. Upwards of a thousand amendments were placed on the paper, and although the obstructionists had been taught that obstruction could not be allowed, and the leaders of the Opposition watched and even aided the progress of the Bill with singular moderation and good temper, the Bill could never have got through Committee had it not been for the commanding influence and the perseverance of Mr. Gladstone. He had some special advantages to favour him—the Report of the Richmond Commission in favour of a judicial rent, the support given to the Bill by the Irish Conservatives, the longing of Parliament and the country to have a Land Bill and have done with it, and the happy discovery of an historical fact previously unsuspected, that the Irish tenant had always had the joint ownership of his holding. But great as these advantages were, no one but Mr. Gladstone, with a majority such as his at his back, could have used them as he did.

The Bill was eight weeks in Committee, and some changes of importance were made in it, although its main lines remained unaltered. It was left to the Court to decide on what grounds the landlord might properly object to a purchase of the tenant right, and fair rent was defined as that which a solvent tenant would pay, regard being had to the interests of the landlord and the tenant. The landlord was permitted, but only after a tenant had refused to pay an increased rent, to apply himself to the Court to have a fair rent fixed; the tenant was prevented from letting a site for a public-house without his landlord's consent, and the penalty for an increased rent was struck out. If these changes are to be considered as changes in favour of the landlord, the changes in favour of the tenant were much more considerable. Power was given to the Court to quash leases given since 1870, which have been imposed on the tenant by inequitable pressure. At the end of any existing lease the tenant was to occupy the position, not of a future, but of a present, tenant, and the question of arrears was settled by providing that if both parties agreed, and the tenant had paid the rent for the year last owing, preceding arrears might be liquidated by half being wiped out and the other half being borrowed by the landlord from the Irish Church Fund and repaid in instalments by the tenant. At the very last stage of the Bill the Government accepted a proposal suddenly made by Mr. Parnell that the Court should during the six months following the passing of the Bill have power to stay all proceedings for eviction on the tenant applying for a judicial rent to be fixed. The Government also rejected three amendments made for the protection of the landlord—that of Sir Walter Barttelot providing that the Court should be bound to purchase estates of landlords wishing to sell, according to a fair valuation; that of Mr. Hennege providing that the Bill should not apply to Irish estates managed on the English system; and that of Lord Edmond Fitzmaurice providing that the Bill should not apply to holdings of more than 100*l.* valuation. The last two of these amendments were moved by Liberals, and supported by an important section of the Liberal party, and were rejected by majorities very small in comparison with the majorities ordinarily at the command of the Government. Provisions were inserted for improving the condition of the labourers, who had been originally forgotten by the Government, by permission being given to reserve sites for cottages. The extreme section of the Irish members offered a violent resistance to the scheme for aiding emigration; and, although this resistance was overcome by arrangements being made for sitting all night to dispose of the clause, yet its scope was altered by the omission of all reference to British colonies as the proper field for assisted emigration, and by the condition being imposed that assistance should only be given when a sufficient number of families in a district should be found to desire it; while the possible effect of the scheme was much limited by the smallness of the sum which was to be applied to the proposed object. Little change was made in the provisions for reclamation and purchase by tenants; and Mr. Gladstone was supported by Sir Stafford Northcote in declaring that his duties to the English taxpayer demanded that he should not go further than to advance three-fourths of the purchase-money. The new court, it was decided, should consist of one legal member, with the rank and pay of a Puisne judge, and two lay members, with 3,000*l.* a year, to be appointed for seven years—a wise proposal, made by Mr. Smith, that the question of the continuance of the lay Commissioners in their posts should, after seven years, be decided by a Royal Commission, so as to avoid the necessity of reference to Parliament, being ultimately rejected by Mr. Gladstone on technical grounds after he had seemed willing to accept it. Finally it was announced that the new Commissioners were to be Serjeant

O'Hagan, Mr. Litton, and Mr. Vernon; and although some disappointment was felt and expressed at men of greater eminence not having been chosen, the plea of Mr. Gladstone that he could not get men of greater eminence, and that he had in vain applied to the Irish Attorney-General and to Mr. Shaw, was accepted as unanswerable. Irish opinion seems to have come to the conclusion that the working of the new Bill will be confided to men fair-minded, painstaking, and of presumably adequate ability.

The debate on the second reading in the Lords occupied the nights of August 1 and 2. Lord Salisbury, who rose after Lord Cairlingford had offered a summary of the provisions of the Bill, gave the key to the whole discussion by pronouncing the measure as revolutionary, as most unjust to the landlords, and as certain to fail in its anticipated effects, as all messages of peace to Ireland had hitherto failed, but announced that he would recommend that the Bill should be read a second time for two reasons—one, the present state of Ireland, due to the culpable negligence of the Government; and the other, the still worse state that must follow the rejection of the Bill, as the Lords had not the executive Government at their command, and had no means of combating the disorder that would arise. What he recommended was that the Lords should remove the most glaring injustices of the Bill, and leave to the Government the responsibility of the measure thus amended. Succeeding speakers on the Opposition side—among whom Lord Lansdowne, the Duke of Argyll, and Lord Cairns were the most conspicuous—were thus free to bestow the severest criticisms on the Bill, which, from the legitimate view of the defenders of property, it deserved, and also to make the political necessity of passing it, which they recognized as its only justification, an additional charge against the Government. The only speech on the Ministerial side that was at all impressive was that of the Chancellor, and it was impressive because it was personal. He owned that the Bill contradicted many of the opinions he had expressed when the Act of 1870 was under discussion; but he found himself this year in the position of having to do something new, and, after long and anxious reflection, he had come to the conclusion that anything short of what was now proposed would be useless. Every one who heard him knew that Lord Selborne was a scrupulously conscientious man, far above holding office for the mere sake of holding it, and that he reflected long before he acted or spoke. What he said, therefore, had all the weight that attaches to the utterance of a man of high character, and gave a warning that if Lord Selborne could have reconciled himself to the Bill, there must have been grave reasons to induce him to act as he had done. On the nights of August 4th and 5th the Lords inserted their amendments in the Bill, the Government when it ventured to divide being in a hopeless minority, as the Conservative Peers were reinforced by a large contingent of independent Liberals. The amendments of the Lords may be divided into three heads—those that removed what were thought to be glaring injustices, those that redressed the balance in favour of the landlords in minor matters, and those which remedied defects of phraseology. The amendments of the Lords were considered by the Commons during the following week, and just as the Lords supported everything proposed by the leaders of the Opposition so the Commons supported by majorities equally sweeping everything proposed by Mr. Gladstone. The amendments remedying defects of phraseology were welcomed, and many of those dealing with minor points were accepted as they stood, or with slight modifications. The main amendments, dealing with what Lord Salisbury called the glaring injustices of the Bill, were dealt with in two ways—some were altogether rejected, and some were met with concessions. Many of the concessions thus made were received with so much disfavour by the Irish party and by some extreme Liberals, that not only had the Government to reconsider some of its own amendments, but the debate was so protracted that it was only terminated by a Committee being appointed in the middle of the night to carry the Bill as amended to the three Peers who were sitting up in a state of extreme misery to receive it. As the Government had announced that it had stretched conciliation to the utmost possible point, and the Bill must now stand or fall as it was, it was expected that the Lords would accept a necessary evil, and let Mr. Gladstone have his way. This was not, however, at all the mood in which it was found that Lord Salisbury and the Opposition were prepared to deal with the Bill as then submitted to them. Where the Government had made no concessions, the glaring injustices complained of were once more summarily removed. Where the Government had made concessions, these concessions were sometimes rejected as insufficient, sometimes accepted with modifications, and sometimes accepted as they stood. Lord Salisbury adhered to the decision he had announced that the Government should have the responsibility of the measure, but only after the Bill had been shaped so that things to which he specially objected had been removed.

The history of the principal amendments may be summed up as follows. Estates or holdings managed after the English fashion were taken out of the operation of the Bill—that is, estates where the improvements had been created, to which Lord Salisbury added "or acquired" and substantially maintained, or, as he preferred to put it, in the main upheld by the landlord. The Lords inserted a clause giving the landlord who had bought up the tenant-right a claim to be repaid out of the purchase-money paid by a new tenant. This was struck out in the Commons, and reproduced by the Lords in the mitigated form of a provision that, where the holding is sold for the first time under the provi-

sions of this Act, the landlord may apply to the Court to apportion him any part of the purchase-money to which the Court shall think he is justly entitled. The Lords inserted and the Commons accepted a provision that the landlord's rent should be a preferential charge on the purchase-money in case of a sale. The new scale for disturbance was struck out by the Lords, restored by the Commons, and again struck out by the Lords. The same fate met the provision that the Court should, in settling a fair rent, have regard to the interests of the landlord and tenant respectively, and the provision enabling the Court to quash existing leases unfairly forced on the tenant. The Lords inserted an amendment that the rent as fixed by the Court should not be reduced on account of any money paid by the tenant to any one else than the landlord. The Commons rejected this, but proposed that the tenant should have no allowance for improvements for which he had been compensated by the landlord. The Lords restored their amendment in the shape that the amount paid for the holding should not of itself, apart from other considerations, be deemed a ground for increasing or reducing the rent. The Lords struck out the clause giving holders under existing leases a right to continue as present tenants on the expiry of the lease. The Commons restored the clause, with a proviso that, at the end of a lease the landlord might resume land which he needed for his own occupation, but without power to relet, except under a present tenancy for fifteen years. The Lords insisted on the clause being altogether struck out. It was finally agreed that there should be an appeal from the Land Commission to the Irish Court of Appeal in other cases, but not in any respect of questions of disturbance, or on the amount of fair rent, or any question of value or damages, or any matter left to the discretion of the Court. The Lords struck out the condition in regard to the purchase of estates, that three-fourths of the tenants should concur in an application, and it was proposed by Mr. Gladstone, and accepted by the Lords, that the necessary number might be reduced to one-half in special cases with the consent of the Treasury. In the same way it was ultimately agreed that the landlord should have access to the Court not only when he has demanded an increase of rent refused by the tenant, but also where he has failed to come to an agreement with the tenant as to what is a fair rent. Both Houses agreed that the tenant might erect new dwellings on his holding in lieu of old ones; but the Commons proposed and the Lords rejected a proviso that the tenant should be allowed to use as dwelling-houses buildings not so used previously. The Lords struck out the proviso that during the first judicial lease fixed by the Court the landlord should not have power to resume, except for the benefit of the labourers. This was restored by the Commons, and again struck out by the Lords. Lastly, Mr. Parnell's clause was struck out by the Lords, and altered by the Commons so as to give the tenant a respite from all proceedings, including those in bankruptcy, but the power of the Court was limited so as to protect him in cases in which the Court might see its way to stating that a judicial rent would be fixed within three months. The Lords again struck out the clause altogether. It was obvious that when the Bill left the Lords after the consideration of the Commons' amendments there were many disputed points on which the Houses had come to an agreement, and that where they still disagreed there were points on which further discussion might lead to an agreement, such as the definition of an English-managed estate, the apportionment of purchase-money by the Court where the landlord had bought up the tenant-right, the declaration that the money paid for a holding should not in itself increase or reduce the rent, the liberty to the tenant to use pig-styes as homes, and the Parnell clause, which in the shape it left the Commons mixed up other creditors with landlords, and made the protection of the tenant depend, not on the justice of his case, but on the state of business in a Court. On the other hand, there could be no hope that the Government would consider the Bill to be its Bill if the provisions directing that regard should be paid to the interests of the tenant, as well as to those of the landlord, those protecting the leaseholder, and those respecting the scale of compensation for disturbance, were omitted.

For a day or two after the action thus taken by the Lords the air was filled with disquieting rumours. It was said that a serious political crisis had arisen, that the Bill was lost, and that the Lords had placed themselves in decided antagonism to the Commons. Those, however, who took the trouble to examine in detail the amendments of the Lords were aware that on many points the Lords were incontestably right, and that, if a proper spirit of reasonableness and conciliation was shown by the Ministry, and accepted with good temper by the Lords, there was no real reason why the Bill should be considered in any serious danger. When Mr. Gladstone rose on August 15 to move that the Lords' amendments should be considered, refused to make any general statement, and insisted that each amendment should be judged on its merits, it was evident that such danger as there might have been had passed away. Mr. Gladstone, in his blindest manner, explained that there were concessions he could not make, but that there were several important amendments made by the Lords to which he could not make the objection that they injured the Bill. The amendment of Lord Salisbury substituting "in the main upheld" for "substantially maintained," with regard to English-managed estates, was rejected, as was the clause giving the Court power to pay out of the purchase-money of a tenant-right what had been paid by the landlord; that altering the new scale of compensation for disturbance; Lord Pembroke's amendment as to deterioration; Lord Lansdowne's

amendment as to resumption during the first statutory term, while the giving the position of a present tenant to a leaseholder whose lease has expired was subjected to a limitation so nominal—namely, that the lease in question must fall in within sixty years—that the clause as drafted by the Government was actually restored. (On the other hand, the provisions inserted by the Lords extending the definition of game to wildfowl, and authorizing the landlord to apply to the Court in case he cannot agree with the tenant as to a fair rent, were accepted, and the Government agreed that tenants' improvements, paid for or otherwise compensated by the landlord, should not be taken into account on behalf of the tenant. Mr. Russell's words, that the Court should have regard to the interests of landlord and tenant respectively, were reinserted; but Lord Salisbury's important amendment, that the sum paid by the tenant should not be deemed a ground for increasing or reducing the rent was accepted. Lastly, Mr. Parnell's clause as to the staying of actions was entirely omitted. The extreme section of the Irish members were vehement in their outcries at what they called the surrender made by the Government; but it was evident that, not only must any concessions made by the Government in order to get the Bill through be accepted by their followers, but that the Bill had really been much improved by the Lords. With some slight modifications, the Bill as now sent back to them was accepted by the Lords. The long contest was at an end, and the Irish Land Bill only needed the Royal Assent to become law. No sooner had this result been achieved than the interest of members in their work, which had been extraordinarily prolonged, collapsed altogether. The remaining fortnight was occupied almost wholly in routine business, such as the conclusion of Supply, the Indian Budget statement, and the Appropriation Bill. For a time it seemed as if the Irish members were determined to resist the progress of business, in order to complain of the refusal of an amnesty to all the suspected persons imprisoned in Ireland under the Coercion Act. Virulent attacks were made by some of them on Mr. Forster, and duly resented by Mr. Gladstone and Sir William Harcourt. But, almost the only event of practical interest was the defeat of the Government on the motion of the Attorney-General for an Election Commission at Wigan. The Lancashire Liberals resisted the proposal, and, with the aid of the Conservatives and a few Irish members, defeated it by a majority of six. Of the minor measures passed at this eleventh hour, only the Newspapers (Law of Libel) Bill, the Welsh Sunday Closing Bill, and the Supreme Court of Judicature Bill deserve notice.

The Session was not without serious troubles and difficulties for the Government. The Land Bill cost it a painful separation from the Duke of Argyll, who preferred to end his long and faithful intimacy with Mr. Gladstone rather than be responsible for a measure which confused the elementary notions of property. He was replaced by Lord Carlingford, who was specially fitted to represent the Government when the Irish Land Bill reached the Upper House, but who could ill replace the general power in debate of the Duke of Argyll in an assembly where the Ministry has little debating power at its command. The Duke had spoken with the fulness of his copious and laboured force when, at an earlier period of the Session, the Government was attacked in the House of Lords for its abandonment of Candahar, and was defeated by a majority more than double the slender muster of its supporters. The counter vote of approval was proposed and carried a month later in the Commons. It was impossible, perhaps, that a Liberal Government should have retreated from the pledges which it had given at the time of the elections and subsequently, and opinions might reasonably differ as to the policy of leaving or not leaving Afghanistan to itself; but when Sir Charles Dilke made capital out of the alleged recall of General Skobelev, he took refuge in an argument false in itself, and signally refuted by the subsequent advance of Russia, which has gained a position commanding not only Merv, but Herat, while the victory of Ayoub Khan has apparently placed Afghanistan at the feet of the only Afghan who has ever beaten a British army. The Transvaal was a still more thorny and disquieting subject. At the end of last year the insurgent Boers had suddenly attacked an English regiment, and an English officer was soon afterwards foully and treacherously murdered. It was announced in the Queen's Speech that the authority of the Crown must be upheld before any concessions could be made, and Mr. Gladstone pointed out, in clear and impressive language, that nothing could be worse for South Africa generally than any arrangements made with rebels in the field. The English public learnt with grief and pain that Sir George Colley, who was in command of the Queen's forces, had sustained first one and then another and then a third defeat, in the last of which he himself perished. Sir Frederick Roberts had been sent out to command the army, which had been greatly increased, and it was supposed that the strength of England would be put forth in an unmistakable way, when the Government announced that it had come to terms with the rebels in the field, that it had determined to give the Boers the independence they demanded, and that the Queen was to retain nothing but a shadowy suzerainty. Lord Cairns immediately reviewed the conduct of the Government in a speech equally elaborate and conclusive; but it was not for months afterwards that Sir Michael Hicks Beach could find an opportunity of moving a vote of censure in the Commons. A faithful majority rejected the motion, and it was evident that Parliament, if not the country, regretted that the Transvaal had ever been annexed, was ready to undo the

annexation, and had no wish that useless blood should have continued to be shed. But no majority and no Ministerial arguments could relieve the Government from the imputation of having, through sheer mismanagement, sacrificed uselessly the lives of British soldiers, and subjected a British force to humiliating defeats. The Government said that before those defeats it had begun to listen to the appeal of the Boers for an arrangement; but, if so, it had no excuse for permitting operations in the field which, if unsuccessful, as they proved to be, would be very damaging to England, and which, if successful, would have made an amicable arrangement superfluous or impossible. In a smaller way the Government was much inconvenienced by the proceedings of Mr. Bradlaugh, who, when a Court of Appeal decided against his contention that he could legally affirm, resigned his seat, was re-elected, although by a small majority, presented himself at the bar of the House, and asked to be allowed to take the oath. Mr. Gladstone contended that legally he was entitled to take the oath; he was a new member, and, when a new member offers to swear, no one can inquire as to the secret and inner meaning he attaches to the words he uses. Sir Stafford Northcote contended, and was supported by a majority in the contention, that, although this was quite true of new members generally, the House could and ought to take notice that Mr. Bradlaugh was a person who the House had already voted should not be allowed to take an oath which he had declared to have no meaning for him. Fresh legislation, as Sir Stafford Northcote pointed out, was the only means of solving the difficulty. To this Mr. Gladstone agreed, and the Attorney-General at once brought in a Bill allowing all members to affirm. But it soon became evident that the unwillingness to see an atheist take his seat did not reside so much in Parliament or the Parliamentary Opposition as in the constituencies, both Liberal and Conservative. The Bill of the Attorney-General was first allowed to languish, and was then withdrawn, being killed, like so many other Bills, by the one monster Bill of the Session. Mr. Bradlaugh, having again presented himself to take the oath, was formally excluded by the House from entering it. So long as the Land Bill was in progress he bore his exclusion patiently, but he has very recently made a foolish attempt to brave the authority of Parliament, and has met with the mild punishment which he courted. It is some consolation in a disturbed time that he is now of much less importance than he was a short time ago. The same, too, may be said of the Land League fraction of the Home Rule party. Long ago Mr. Shaw, Mr. Smyth, Mr. Mitchell Henry, and all the Home Rulers of position and respectability, openly broke with the Land League and Mr. Parnell. The score of members who still obeyed Mr. Parnell, and obeyed him perhaps more blindly than ever, carried obstruction to lengths unknown before, abused the Government and every member of it with the coarsest vituperation, plied Mr. Forster with annoying questions, and denounced him as the curse of Ireland; but their power of mischief grew gradually less after obstruction was overcome, when Mr. Forster was supported not only by Mr. Gladstone, but by the general sympathy of the House, when it became obvious that the Irish people did not approve of the vexatious resistance offered by Mr. Parnell to the Land Bill, and, above all, when it was found that the extreme wing of the Irish party was having recourse to dastardly attempts at assassination and destruction of English public property. The attempt to blow up the Mansion House was followed by the attempt to blow up the Town Hall at Liverpool, and then again by the attempt to introduce into Liverpool explosive machines from New York. The assassination of the Czar and the attempted assassination of the American President necessarily awoke society to the new dangers with which its chiefs are in these days surrounded. The Home Secretary, with the marked concurrence of the House, showed a firm front to these lawless assailants of society. He warned the public that the dangers of which he knew, and of which the public did not know, were real and serious; he frankly owned that he would have recourse when he pleased to his unpopular, but perfectly legal, power of opening letters; he instituted a successful prosecution against a wretched German who had preached assassination in a paper published in England; and he denounced in the strongest terms the kindred press in America which teaches the Irish in and out of Ireland how they are to bring the English Government on its knees by the free use of dynamite.

During the Easter recess an event took place which profoundly touched English society, from the throne to the cottage, and gave a new and a poorer colouring to English public life. On April the 19th Lord Beaconsfield died, after an illness every turn of which had been watched with keen anxiety and eager interest. Every section of the public paid a ready tribute of admiration to the memory of one who, if not a great statesman, was the most brilliant of party leaders, and who had pursued a striking and original career till he had attained the highest crown of his ambition. All that could or should have been said on such an occasion in Parliament was said by Lord Granville and Lord Salisbury in the Lords, and by Mr. Gladstone and Sir Stafford Northcote in the Commons, and a very small minority was found to support Mr. Labouchere in his opposition to the natural proposal to honour the memory of Lord Beaconsfield by the erection of a national monument in Westminster Abbey. As chief of his party Lord Beaconsfield was not replaced; but Lord Salisbury was chosen to succeed him as leader of the Conservative majority in the House of Lords. For the position thus assigned him Lord Salisbury was marked out by an exceptional combination of intel-

lectual ability, debating power, and high social position, and time has already shown that, in addition to his other qualities, he has the wisdom to know when to yield and the moderation to know when to spare. As the Government, in order to secure the passage of the Land Bill, withdrew all Bills that could raise contention, there was little opportunity for observing how the leader of the majority in the Lords would treat the minor measures of their opponents; but there was no trace of domineering or partiality in the objection raised by Lord Salisbury to the Charitable Trusts Bill, that it made nonentities of local trustees, or in the slight alteration introduced by Lord Cairns into the Court of Appeal Bill when he deprived the puisne judges of the invidious privilege of electing from their body three temporary Judges of Appeal. The death of Mr. Adam, so long the Whip of the Liberal party, called forth a fitting expression of esteem and regret not only from Mr. Gladstone, but also from Sir Stafford Northcote. The Budget was wholly uninteresting, Mr. Gladstone making up for a slight deficit due to the taking off from the Income-tax of the penny last year by an augmentation of Probate duties and a change in the mode of collecting the duties on spirits, and the great reforming financier of the age would have done nothing in finance of which the public could take cognizance had he not proposed a grant to India in aid of the expenses of the Afghan war, which seemed small after all that had been said of the duty of England to avoid charging impoverished India with the cost of an Imperial war, had he not thought of the simple and popular device of making one stamp do both for postage and receipts, and had he not proposed an ingenious scheme for reducing the National Debt by prolonging a portion of the Terminable Annuities soon to expire so as to substitute them for the Consols held by Government officers. Mr. Childers expounded with ability and carried with almost uncontested success his last new scheme for reorganizing the army, and Mr. Trevelyan justified his promotion by a sketch of what has been done, is being done, and is to be done for the navy, which was at once lucid, complete, and interesting. Mr. Courtney has also been twice promoted, and now that he is in the office of which he was at one time the sole critic proved to be in the right, he has an opportunity of fulfilling the high expectations he once raised; while in Mr. Grant Duff, who has replaced Mr. Adam at Madras, the Ministry has lost a member whose zeal and knowledge, alike varied and inexhaustible, gave him a special place in Parliament. It is in the sphere of foreign politics that the Government has, apart from the Land Bill, been most successful from a party point of view. Sir Charles Dilke has parried or answered difficult or dangerous questions with an adroitness and firmness which were never found wanting, and with the happiest ignorance when ignorance was required. Mr. Goschen has led the European Concert in settling the Greek question without war and without unfairness to either of the contending parties, and has exhibited in the settlement of this complicated business a resolution and an alternation of stiffness and pliability which received the cordial acknowledgment not only of Lord Granville, but of Lord Salisbury. When France was found to have embarked in its rash adventure for the subjugation of Tunis, Lord Granville accepted the situation which had been created for him, allowed France *lair play*, and was most polite and considerate to M. St.-Maire, but firmly insisted that England must retain every right in Tunis secured by treaty, pointed out the diplomatic difficulties to which the arrogant assumption of French officials must lead, and declared that the position of England in Egypt must not be assailed, and that she would decidedly object to France as a neighbour to Egypt in Tripoli. The House of Commons has viewed with natural impatience the obstacles interposed by France in the way of a renewal of the Treaty of Commerce, but it only wished to strengthen the hands of the Government when, in spite of the formal opposition of the Ministry, it gave vent to this impatience in a vote which committed it to little or nothing. Nothing has indicated that, to any serious degree, the Ministry has yet lost its hold on the country. On two occasions during the discussion of the Land Bill a section of the Liberal party, more weighty in social position and in private character than in numbers, broke away from the ties that ordinarily bind them, and Mr. Goschen since his return has more than once shown his resolution to occupy an independent ground. But, on the whole, the vast Liberal majority has clung to its chief with singular fidelity and tenacity. When the Ministry begins to grapple with the long series of questions which it came into office to solve, and still more when age or the lassitude consequent on a great and unparalleled effort deprives it of the commanding influence of Mr. Gladstone in the House of Commons, the real struggle of parties will begin.

#### A LESSON IN HUMOUR.

**T**HERE is good authority for not expecting to find figs growing on thistles. But it will be acknowledged by every one that, if a fig were discovered in that unusual position, great and remarkable interest would be felt in it. According to the chief supporters of the present Premier, something like this miracle has recently been noticeable in the case of Mr. Gladstone. Friends and enemies alike have always agreed to recognize remarkable gifts in the right honourable gentleman; but friends and enemies alike have agreed that among those gifts humour is not exactly the most prominent. When Mr. Gladstone attempts to make a joke, his admirers tremble and his foes uplift their horn. The jest

usually consists of the citation or adaptation of comic poetry of a very peculiar kind, so peculiar that it is not known whether Mr. Gladstone keeps a special private poet, or, emulous of Oaehing, elaborates his poetical jokes himself. The celebrated ballad of "The Three Jolly Allsopps," the more ancient, but scarcely less remarkable, ditty in which "bacca" rhymed to "Malacca," are perhaps the most famous of Mr. Gladstone's productions when he is in merry piar. The recognition of humour in either of these unbendings would add a new intricacy to the task of defining that much-debated word. Indeed, the *Daily News*, which may be taken as an indisputable witness in a certain sense, admits that Mr. Gladstone has not hitherto been celebrated as a jester. But now, it seems, all is changed. The stately but aged tree "miratur novas frondes et non sua poma." "Of late Mr. Gladstone has added to his former gifts a playful humour and an irony which has more of good-nature and compassion in it," &c.; while the *Poll Mall Gazette*, obsequiously endeavouring to cap the contemporary which had some hours' start of it, is eloquent about "the heavier fruitages of thought" and "the lighter flowers of imagination." The writer of the Parliamentary summary in the morning journal characterizes the speech on which this estimate is founded as "one of the most humorous ever delivered in the House," which, considering the history of that House, may be said to be strong language. Very luckily the same authority vouches for the verbatim accuracy of the accompanying report. There can therefore be no difficulty in examining this surprising new species of a great genus—the Gladstonian humour. Shakspeare, Butler, Swift, Fielding, Sheridan, Ganning, Thackeray—the diapason closes full in Mr. Gladstone.

It will be admitted by all impartial persons that the Premier had at least something more than a fair chance of displaying the gifts which the gods have, according to his supporters, showered upon his old age, making it veritably the best of life. His theme was Mr. Ashmead-Bartlett, and the highest respect for the excellence of Mr. Ashmead-Bartlett's intentions is compatible with a recognition of the fact that those intentions do not invariably result in expression of complete felicity. A well-meaning man dealing with subjects about which most of his hearers know nothing and care less needs a very considerable oratorical or literary talent to escape the possibility of ridicule. Supposing, for instance, that Mr. Ashmead-Bartlett had been a Liberal, and that Lord Beaconsfield were alive, and in the House of Commons, the late (in that case future) volume of *Wit and Wisdom* would probably have been increased by not a few sayings which the Parliamentary world would not willingly let die. With a good subject, a sympathetic audience, and a mind focused and divine with political success, it was certainly the time for Mr. Gladstone to show the colour of his humour. He began, "He had some doubt whether he ought not to allow the speech to be buried in the midst of the solemn silence which appeared in all quarters to have been prepared for its interment. (Laughter.)" If there is any humour here it apparently lies in the phrase preparing silence, which has at least the merit of being unusual. Would Mr. Gladstone tell us how to prepare silence? To prepare speech is certainly possible, but the preparation of silence seems a little difficult. Besides, as Mr. Ashmead-Bartlett's speech appears to have been diversified, not merely with "Hear, hears," but with "Ohs," cries of "Withdraw," polite contradictions by zealous Liberals, &c. &c., the strict accuracy of the description seems as questionable as its humour or intelligibility. Perhaps Mr. Gladstone had prepared, not silence, but his remark about the preparation of silence, and felt bound to use it. In the following sentence he remarked that "he should not go too far if he were to call Mr. Ashmead-Bartlett's speech outrageous." This was certainly running very bad humours on him in Nym's sense, but in any other it can hardly be said that it is very humorous to call a man or a speech outrageous. The next two points which the amateurs of Gladstonian humour laughed at were the statement that Mr. Ashmead-Bartlett had come forward to do his duty to his country (laughter), and the statement that there was an audience of only two persons on his own side of the House. (Laughter.) It is, indeed, not impossible that the idea of a member of Parliament thinking that his duty to his country required him to speak when he thought his country was going wrong may have seemed humorous to a few advanced Radicals; but even those gentlemen can hardly, we should think, see anything particularly full of humour in Mr. Gladstone's statement of the fact. Then the Prime Minister said that everything which his enemy asserted he denied, and everything which Mr. Ashmead-Bartlett denied he asserted. A roar of laughter greeted this novel and exquisite device of oratory, which, if we recollect rightly, Mr. Gladstone applied some time ago to Lord Randolph Churchill, so that it is evidently a favourite of his. "I think, sir," proceeded the Premier, "that the application of that succinct formula will dispose of the whole of the oration we have heard." As there could be no conceivable case in which the succinct formula would not dispose of the whole of any oration of any orator in the history of politics and literature, the "laughter" which followed seems a little inexplicable. Besides, Mr. Gladstone has forgotten that there is a still more succinct formula of equivalent meaning, which is also thought humorous in certain circles, and of which his friend and colleague the Chancellor of the Duchy of Lancaster is very fond. Then Mr. Gladstone said that it was painful to him to be in a position of mortal antagonism to Mr. Ashmead-Bartlett (and his obedient henchmen laughed), and he said that Mr. Ashmead-Bartlett referred to the pain he was inflicting upon him, Mr. Gladstone (here they laughed consumedly), and he said that he was truly

thankful for Mr. Ashmead-Bartlett's sympathy (here they laughed again). "He would," said the Premier, "endeavour to bear up against it till Mr. Ashmead-Bartlett gave him his quietus"; and at this masterpiece of entirely original humour roars of mirth were heard. Mr. Ashmead-Bartlett said that Cyprus gave command over the land routes of the future, which is as simple a matter of fact as if he said that Gibraltar commands the Straits. Mr. Gladstone repeated the phrase, and his followers howled with delight. We have no doubt that they privately implored him not to repeat it again, for they really should die of laughing. They laughed when he said that Mr. Warton had arrived with an armful of books, and they laughed when he said that Mr. Warton was reserving his store for one of the later orders of the day. Shrieks of hilarity greeted the statement that Mr. Ashmead-Bartlett doubtless had millions in his pocket to make a harbour at Cyprus—a harbour, be it remembered, which Admiral Sir G. P. Hornby, who knows something more about harbours and Cyprus than even Mr. Gladstone, says can be made for a couple of hundred thousand pounds. More shrieks welcomed the quotation about the Spanish fleet, and here there is no fault to find, for there certainly is humour there, though it is hardly Mr. Gladstone's. We do not know that we have space to continue the dissection of this new kind of humour, the finest flowers of which, save one, have been honestly given. That one must not be missed. "I wish to leave these observations free course throughout the whole world, to circulate and distil themselves, if they could or would, into the minds of civilized mankind, in order that the digestions of the various cultivated races might dispose of them in the proper manner." Beyond this it is evident that the force of refined and lambent humour can no further go. The appropriate consecration of the metaphors, the neat precision of the phrase, the infinity of humorous suggestion conveyed, certainly justify the eulogies bestowed on the latest English humourist.

Now we have not the least intention of throwing any blame or ridicule upon Mr. Gladstone for this utterance of his. When a young man who has no particular gifts of eloquence makes an inconvenient speech—and Mr. Ashmead-Bartlett's speeches, with all their faults, are generally very inconvenient speeches for the present Government—an old man of authority and command of language has, in face of an ignorant audience, no better game to play than to take them good-humouredly, and, if he can, to make fun of them. He is nearly sure of success, because his audience does not know the truths of fact that underlie the awkward manner, and is quite prepared to laugh when the signal is given. Mr. Gladstone's jests are on a par with Sir Charles Dilke's elaborate ignorance of the contents of the *République Française*—a reactionary paper, edited and inspired by persons whom Sir Charles holds in horror—of the methods of communication between London and Meshed, of the antecedents of Herr Most, &c. They are polemical utterances, and quite fairly polemical. If members of the British House of Commons choose to know nothing about very obvious and simple facts, they invite their leader to exploit their ignorance in the way most convenient to him. But what is to be said of the admiration which holds up utterly commonplace exertations in dialectic sarcasm as evidences of a precious and delicate faculty of humour vouchsafed as a last and crowning gift to a great master of eloquence? The concluding sentence of Mr. Gladstone's speech is really worth quoting as an instance of the playful irony, the good-natured humour, and all the rest of it:—"Let him learn this—that if he really wants to make an impression on the world; if he really wants to give aid to his friends and to inflict disaster on his adversaries, the very first lesson he must learn is to restrain his universal and sweeping propositions within bounds of fact and actual experience, to submit himself to be taught by the lessons of the world and the lessons of the day, and to learn and know that moderation, reserve, consideration for those with whom you have to deal and the endeavour to bring your propositions into exact conformity with the circumstances of the case, are for him and for everybody else the very first conditions of useful and durable success." Admirable advice, truly—but humorous? The speaker of the Midlothian speeches counsels moderation, reserve, consideration for those with whom he has to deal. Mr. Gladstone complains of universal and sweeping propositions. The Minister who had humbly to apologize for the impolicy and inaccuracy of his onslaughts on a friendly Power talks about the importance of bringing your propositions into exact conformity with the circumstances of the case. There is certainly humour here, but it is of the most unconscious. There is also certainly something else than humour—namely, an exuberance and a loquacity which—but here we are plagiarizing. Only let it be said that if this is going to be the humour of the future, we sincerely trust that we shall have as few humourists as possible. Fortunately the past exists—and when Mr. Gladstone or any of his imitators begin a humorous speech, the Librarian of the House of Commons will perhaps see that there are sufficient copies ready in the Library of the *Anatomy of an Equivalent*, of the *History of John Bull*, and of the *Anti-Jacobin*, to counteract any bad effects which the style may produce on the younger members of the House. Perhaps, also, though this is less probable, a slight perception of what is and what is not humour may dawn upon Mr. Gladstone's admirers before long, and they may adjust their standards of imitation accordingly.

## TURTLES AND INSECTS.

MOST readers of *Punch* will remember a picture representing a railway porter holding a tortoise in his hand and addressing an old lady in these remarkable words:—"Station-master says that rabbits is dogs and cats is dogs, but this 'ere's a kinsect, and there aint no charge." This somewhat arbitrary classification has been undesignedly imitated by the Zoological Society, who have placed their new Insectarium in close proximity to the tortoise sheds, and have even devoted a tank in the insect-house itself to some members of the turtle tribe. Few words are so suggestive as "turtle." To the official dinner-out or City magnate it calls up reminiscences of heavy feeds, rapid speeches, and much boredom and indigestion; but the epicure, if he be "healthy, wealthy, and wise," can dwell with satisfaction on "calipash and calipee," and the more dainty fins subtly dressed with truffles. The thoughts inspired by the mention of the delicacy are for the most part pleasant, unless it be to the mariner who, having sojourned at Ascension Island, has lived on nothing else for months, or whose experiences include that of his vessel "turning turtle"—i.e. turning completely over in the water, a manoeuvre which cannot be accomplished without inconvenience to those on board. The application of the name "turtle" to that species of pigeon which is metaphorically used to illustrate happy marriage, of course gives it an entirely different significance to many people; and there is again the Biblical association of ideas, such as occurred to the young traveller in Mark Twain's humorous account of his "New Pilgrim's Progress" through the Holy Land. The youth was sitting pensively in the broiling sun beside a little rill watching a "mud turtle," with the expressed intention of heaving a rock at it as soon as a certain term which he had proposed to himself should expire. Being asked for an explanation of his conduct, he said that Colonel Church had told them at prayers, and had even read out of the Bible, that the country they were in was "flowing with milk and honey," and that "the voice of the turtle was heard in the land." "I've sat there," he continued, "and watched that turtle nearly an hour to-day, and I am almost burned up with the sun, but I never heard him sing. I'll give him ten minutes to commence—ten minutes; and then, if he don't, down goes his building!"

The habits of the turtle may be studied in the windows of certain restaurants, although the limited accommodation cramps the energies even of so sluggish an animal. In the Zoological Society's Gardens some varieties of the species may be seen to greater advantage. There, on a bright morning, the terrapin tanks and the tortoise sheds and paddocks present an appearance of quite unwonted animation. The "old man terrapin," whose general appearance is that of a sandwich roughly constructed out of two pieces of knotty oak-tree bark and old rags, with the edges of the latter left loose, will be seen gaily snapping up little fish; the alligator terrapin, protruding his long neck and tail, and trying to look as much like his namesake as possible, sallies forth from his pond, seeking what he may devour. The monster land tortoisoes feed ravenously on turnips and other vegetables, snapping great pieces out with their parrot-like bills; while the smaller kinds waddle anxiously about, and look, especially from behind, like fat old gentlemen in overcoats, intent on botanical researches. Some of the larger specimens, when engaged upon their morning meal, are the exact counterpart of the one figured in the illustrations to Don Gaultier's celebrated ballad of the "Snapping Turtle," in which the habits and appearance of the ferocious reptile are so well described:—

And the waters boiled and bubbled;  
And in groups of twos and threes,  
Several alligators bounded,  
Smart as squirrels up the trees.  
Then a hideous head was lifted,  
With such huge distended jaws,  
That they might have held Goliath  
Quite as well as Rufus Dawes.

There are no alligators and no trees in the tortoise paddock at the Zoo; but it is a scientific fact that the *Trionyx ferox* will bite a young alligator in half; so that the conduct of those mentioned in the ballad, although eccentric, is not unreasonable. The snapping turtle well deserves its name; for, if works on natural history are to be believed, the fingers of imprudent and inexperienced sailors seem to form its staple food.

The tortoise has not accomplished the feat of taking off its flesh and sitting in its bones, but it has done the next thing to it. It is the first example of a skeleton brought to the surface; the back is incapable of movement, and the scales with which a less ambitious reptile is content have developed into the horny shield which covers it, while the bones of the chest have developed into a box capable of containing the creature, head and legs and all. In fact, if we belonged to a past generation when inane plays upon words were taken for wit, we should have most probably said that the chest of the tortoise is a box to hold its trunk. The horny integument of the *Schild-kroete*, "Shield-Toad," as our Teutonic brethren so graphically call him, is scarcely less rich in associations than his family name, suggesting, amongst a crowd of other memories, the high tortoiseshell combs, short waists, whisk and pump-room manners of the beauties of the Regency. The arrangement for wearing the skeleton outside, and packing the whole body away in the case formed by it, is convenient, but not an absolute protection against foes. The lithe and wily panther, for

instance, has a habit of inserting his paw into the opening left for the protrusion of the head, and thus extracting the animal. The turtle, moreover, is at a decided disadvantage when turned over on its back, which is a favourite method of securing those which come ashore to lay their eggs. Against ordinary dangers the thick shield is a very useful safeguard; but the impossibility of receiving any impression through the skin of the body must have its disadvantages too. How, for instance, does a tortoise manage in those cases which a cow provides against by a rubbing post? Supposing it to be possible for him to suffer from any such inconvenience, he would be even worse off than a mediæval knight armed *cap-à-pie*, beneath whose steel panoply a specimen of the domestic *pulex* had secreted itself.

Of the specimens of the turtle tribe at the Zoological Gardens the most interesting are the alligator terrapin and the salt-water terrapin, both of which we have already described. They are considered a great delicacy in the United States, especially the ragged-edged variety. Of the ordinary edible turtles, better known in this country, the "green turtle" is the best. This species is found in great abundance in Ascension Island, where they are captured and kept in ponds for exportation. Their great tenacity of life facilitates their preservation, and it is a well-known fact that the head of a turtle will live, and snap at anything put in its way, for some time after it has been severed from the body; while the heart will pulsate for hours after being removed. When the season for depositing their eggs in the sand is over, and the turtles no longer come ashore, they are hunted in the water. This is done in boats. The turtle is pursued until fatigue or fright induces it to cease swimming and sink to the bottom, when it is transixed by a heavily-weighted and barbed harpoon, and so secured. Of the land tortoises, the smaller ones, often sold in great numbers in our streets, are, for the most part, brought over as ballast. They are a very useful addition to a lawn or grass-plot, killing the worms and noxious insects; and, as they live to an immense age, and require no attention at all, they are not an unprofitable investment.

The Insectarium is well worth a visit for its more immediate and legitimate contents. Here are to be seen many sorts of beautiful butterflies and moths—both British and foreign—in various stages of development. The present time is very favourable for observing them, as they are now just leaving the chrysalis state. Then, again, there are tiger beetles darting fiercely about in jars of water; and specimens of the curious leaf insect, which can hardly be distinguished from the leaves of the tree on which it feeds. But most curious and interesting of all is a little colony of trapdoor spiders' nests; unfortunately, without inhabitants. This insect, which is a native of Jamaica, digs a hole in the ground, and lines it with a silken web; the mouth of this is closed by a trapdoor, with a hinge, which permits of its being opened and closed with perfect accuracy. The door is circular, and is made of alternate layers of earth and web. The trapdoor spider gains its livelihood by hunting at night and by catching insects in the nets which it spreads beside its door. The Society also possesses a specimen of a gigantic spider from the West Indies, whose ordinary food is cockroaches, but which is said to be able to kill and devour a mouse. In the Fiji Islands, where cockroaches are a real pest, spiders of this kind are a blessing to society, and no housewife would dream of allowing their webs to be disturbed. The tarantula, of uncanny reputation, is also there, but not alive. The spider is so called from the town of Tarentum in Italy, amongst the inhabitants of which the belief existed that a certain nervous disease was produced by its bite, which could only be cured by music. The insect is really perfectly harmless to man, and the epidemic was due to hysterical excitement.

The arachnida are most interesting insects, and many a half-hour might be worse spent than by watching the habits of a spider which has taken up its residence among the plants in the conservatory or on the window-sill. Very carefully does he choose the most convenient hunting ground, and that where flies do chiefly congregate. With great pains and ingenuity does he carry out stays to distant twigs, and with great perseverance and mathematical precision does he weave the bands between until a perfect polygonal reticulation is made, terminating in a point in the middle, which he twists and pulls until the whole structure is taut. Then, having tested its strength in all parts, he rests satisfied with his work, and lies in wait until some heedless vagrant fly entangles itself in the meshes of the outspread net. In a moment the spider is all excitement and activity; if the capture be small enough, he carts it off with lightning rapidity to his lurking place, and feeds on it at leisure. If, on the other hand, it be large and unmanageable, he makes for it at once, attacks it fiercely, and fastens on it until it is dead, thus securing his net from damage by the struggles of the fly, and, at the same time, a hearty meal for himself. The Insectarium is a valuable addition to the attractions of the Society's collections; it is at present only in its infancy, but will, no doubt, develop into an important establishment. The more facilities there are for the minute and accurate study of the lower forms of life, the more will the conditions of the highest form, the human, be understood. From this point of view turtles and insects are alike able to impart many a valuable lesson.

## POCOCURANTISM.

IN one of the letters "to an old pupil" published in *Arnold's Life and Correspondence* we have a vigorous denunciation of what the writer calls "Pococurantism." And as the "value of Veneration" is given in the Table of Contents as the subject of the letter, his biographer must have understood him to mean by pococurantism the opposite quality. His own description of the fault he is criticizing harmonizes with this estimate. He identifies it with the Horatian maxim of *Nil admirari*, which he calls "the Devil's favourite text," and the best he could choose "to introduce his pupils into the more esoteric part of his doctrine." He speaks of it partly as a special vice of the age, partly as a defect incidental to early life; it "is much the order of the day among young men." He had even observed inchoate tendencies that way among his boys at Rugby, and was "always dreading its ascendancy" there, though there were some who struggled nobly against it. As to the thing itself, he says he has "always looked upon a man infected with this disorder of anti-romance as on one who has lost the finest part of his nature and his best protection against everything low and foolish." He adds that such men may well call him mad, but he thinks their party are not yet strong enough to get him fairly shut up, and till they are, he shall "take the liberty of insisting that their tail is the longest." The outburst is a very characteristic one, though it may possibly enough surprise some who have been accustomed to regard Dr. Arnold simply as a modern Radical and Broad Churchman. This would be a most inadequate view of his real position. That "the bump of veneration" was strongly developed in his nature there can be little doubt, though he did not greatly venerate some objects for which several of his early Oxford friends entertained a high reverence, and was in the habit of dealing hard blows at the idols he wished to demolish. But it would be altogether a mistake to regard him solely or chiefly as an iconoclast, and we may safely add that, if he had been such, he would never have succeeded in eliciting the enthusiasm and accomplishing the work for which he is still remembered. That a spirit of flippancy and irreverence is a common however ungraceful feeling, not so much of boyhood—in their case it would be the result of evil training or example—as of youth or incipient manhood, is notorious. There is much of course in the newly acquired independence and the sense of rapidly maturing powers of a youth fresh from school or from the university to encourage such a feeling. In wonder, it has been justly said, philosophy begins and ends, and wonder is a reverential attitude of mind, but there is an intermediate stage of development, when confidence, not to say arrogance, supersedes it. Those who know nothing and those who know much have no difficulty in realizing the extent of their ignorance, but those who know a little are not equally ready to acknowledge how much remains unknown. It will be said by many that this sort of temper, or "disorder"—which used then to be called by a shorter and sharper name than pococurantism—was thought specially characteristic of Rugbeians at the university some forty years ago, as distinguished from their Etonian or Harrovian or other public school contemporaries. How far this was so, and how far it was due to Dr. Arnold's influence, are questions it hardly concerns us to revive now; it was clearly not the result he intended or desired to produce. But his letter suggests a wider question, which has certainly not lost its interest, as to the alleged decay of veneration in the present age, and the ethical estimate to be formed of it. The "anti-romance" school are not indeed yet strong enough to "shut up" their more romantic and reverential contemporaries, but it is often said or surmised that they are gaining strength, and we may fairly ask whether their advance, if they are advancing, should be welcomed or opposed.

In a purely utilitarian scheme of ethics the feeling of reverence, if it claims any place at all, must hold a very doubtful one. It becomes at best nothing more than a conviction that those whose superior power enables them to benefit or injure us will, in fact, only do us good. Hence Hobbes defines it, in its religious aspect, as "the conception we have concerning another, that He hath the power to do unto us both good and hurt, but not the will to do us hurt." And it has been plausibly argued that the great evils to which it has given rise, in the way both of religious superstition and political servitude, make it a source of more misery than happiness to the world, while, as it grows out of a sense of dependence, whether on God or man, the habits fostered by advancing civilization are thought to undermine its power in either sphere. A contemplation of the order of nature and the reign of universal and unchanging law has not, it is urged, at all the same tendency to awaken in ordinary minds feelings of veneration as a belief in the constant and direct interposition of Providence in natural phenomena. *Cælo tonantem credidimus Jovem* is the awe-struck confession of a rude and barbarous age, but those who are familiar with the laws of electricity are content to look at nature, without caring, as the poet bids them, to "look through" it "up to" a higher Power beyond. Sailors, who are usually ignorant men, and are brought into habitual contact with the great forces of nature, are said to be religious or superstitious in the older sense. And thus, too, it is in the secluded mountain paths of Styria or the Tyrol that the frequent reappearance at every turn of crucifix, or wayside oratory, or devout picture, reminds the traveller of the simple devotion of simple men who hear the voice of God in the rolling avalanche and bend humbly beneath His outstretched hand, whether it be lifted

in mercy or in judgment. In the awful gloom of a Gothic cathedral, again, we discern, if it be through a glass darkly, the deep reverential piety of those great mediæval builders who, as Mr. Ruskin puts it, "have taken with them to the grave their powers, their honours, and their errors, but have left us their adoration." And if we turn from the religious to the political order, there too it may be argued that the old world virtue of reverence must succumb to the progressive demands of civil and religious liberty. Loyalty to the person and authority of the Sovereign was a guarantee of civil and social order in an age of absolute governments, but we have learned to substitute, in politics as in philosophy, the supremacy of law for the direct action of personal rule, and those who are ultimately the makers of law, while bound to obey, can hardly be expected to venerate, the work of their own hands. There is an obvious difference in idea between a loyal and a law-abiding people, though the practical result may in either case be much the same. And thus, alike in the religious and the secular sphere, veneration must give place to virtues better suited to our altered state. "The self-assertion of liberty, the levelling of democracy, the dissecting-knife of criticism, the economical revolutions that reduce the relations of classes to simple contracts, the agglomeration of population, and the facilities of locomotion that sever so many ancient ties, are all incompatible with the type of virtue which existed before the power of tradition was broken, and when the elasticity of faith was yet sustained." And thus, to revert to Dr. Arnold's phraseology, "*Nil admirari*, the Devil's favourite text," becomes a necessity, if not a virtue, of a democratic and unromantic age like our own.

There is no doubt much plausibility in this line of argument, and it so far at least holds good that the forms, if not the essence, of veneration must vary with the changed intellectual and social conditions of the day. But for the moralist, who knows, as well from experience as on ethical grounds, that no character can be really great, or indeed be other than conspicuously defective, in which a sense of reverence is wanting, it would be difficult to grant more than this. Not only does a reverential spirit, as it has been observed, present just that form of moral goodness to which the epithet beautiful may be most justly applied, but there is a deficiency, a littleness, a priggishness, a sort of vulgarity, observable about even the highest type of moral goodness attainable without it. It is not too much to say that the man who lacks it "has lost the finest part of his nature," and it is hard to believe that any intellectual or political progress, which deserves the name, can necessarily entail so terrible a sacrifice. That a monarchical is better suited than a republican régime to foster the sentiment of loyalty may be perfectly true, and so far as it is true, affords an argument in favour of monarchy; indeed this is, we suppose, the truth underlying Dr. Johnson's well-known dictum that "the Devil was th' first Whig." Nor can there be any doubt that to ordinary minds the enlargement of scientific discovery does tend, at least while it is in actual progress, to deprive natural phenomena of their moral significance, and thus to lessen religious reverence. And the marvellous rapidity of this scientific movement during the last half century, as compared with any previous period of the world's history, has given to that tendency a disproportionate and perhaps only temporary force. Yet, after all, the principle of religious veneration is no more involved in these recent discoveries than in the first suggestion of the antipodes, so startling to mediæval orthodoxy, or in the revolutions of Galileo. Wordsworth speaks of religion as the "mother of form and fear, Dread arbitress of mutable respect," and the reverence she inspires need be none the less real though its expression may inevitably be varied from time to time. That sense of dependence and craving for a something higher than self to look up to and rest upon, which exists in germ in all but the most debased natures, while it is very differently developed according to character and circumstances, will not suffer itself to be defrauded of its proper satisfaction by the dominance of the ballot-box or the dissecting-knife. And if it be objected that the men of our own time, to whom we should instinctively point as typical examples of this romantic or reverential mind—men such as the late John Koble—belonged to a past or passing generation, and were out of sympathy with the spirit of the age, it is obvious to reply that this is only very partially true. Not a week has passed since a favourite pupil, and lifelong and trusted friend of Mr. Koble, was committed to the grave, who shared to the full, if any one did, his devout and reverential temper; yet the late Sir William Heathcote was at the same time, as Lord Carnarvon described him in the *Times*, the pattern of an English country gentleman and chairman of Quarter Sessions, a shrewd man of business and politician, and in the best sense of the word, a thorough man of the world. We might indeed point to the case of Arnold himself, who was suspected and denounced in his lifetime as an extreme partisan of revolutionary liberalism both in Church and State, but who nevertheless passionately protested, as we have seen, against the irreverent or "pococurantist" temper of the day, in which he detected a grave moral danger. And this strength of feeling on his part is the more remarkable, because he was an ardent reformer, and reverence is not usually the special attribute of reformers, as Mr. Hurrell Froude noted, when he roused the fierce indignation of all good Protestants by dubbing Bishop Jewell an "irreverent Dissenter." Carlyle on the other hand, however small his respect for much of the "moonshine" held in high reverence by many of his devoutest contemporaries, would have deprecated with genuine horror the charge of irreverence. He considered himself indeed the special witness and

prophet of the opposite virtue to a shallow and profane generation, though it must be allowed that he was not always happy in the particular objects he singled out to present for their veneration. And if *nil admirari* be the foundation of diabolical ethics, it may be allowed that to give honour to whom honour is not due is only less injurious to the character than to refuse to honour any but ourselves. The real danger of an age like the present, where many ancient forms of reverence seem to have become obsolete, is perhaps not so much that the value of veneration will be forgotten as that it will be misinterpreted. Goodness alone, whether human or divine, has a paramount claim on our homage, but it is quite possible, not merely to admire or covet, but to reverence power, knowledge, wealth, success, nay even successful villany. To worship a false ideal is sometimes worse, is at best only somewhat better, than worshipping none at all. And such is the instinctive craving of human nature for some actual object of veneration that the frivolous scorn or insouciance which refuses it all legitimate scope will usually be found cowering at last in the witch's cave or cringing before the golden calf.

#### AUTUMN IN THE HIGHLANDS.

FOR those who love a life of vicissitudes and games of chance and skill, there is nothing like a shooting lodge in the Highlands in the autumn. The skill is of course displayed in the shooting. It is true that when there is sunny weather on the opening days, the shooting is as easy as shooting can be. The coveys lie like stones in the heather, till the dogs are actually drawing into the midst of them. The old birds, sticking affectionately to their helpless offspring, defer rising till it ought to be far too late for them, offering the steadiest of marks, as they skim straight away over the moor; while the innocents flutter up in an excited flock. The veriest novice, if tolerably cool, may pick out his brace with fatal certainty; while, should he be unsportsmanlike enough to bluze into the thick of the brood, he may probably gather a shattered handful. The survivors wing a feeble flight and drop well within sight, to be followed up and slaughtered singly. The guns gain confidence as the bags fill, and there are brilliant reports for the local papers. But things are very different when the weather is wet and rough, or as the season advances. It is then that science comes in, with a great deal of quick shooting. The broods that have been shifting restlessly about the hills are keenly looking out for the approach of an enemy. The shoulder of a dog, or the head of a man, shown against the skyline over the nearest ridge, is quite enough to give them the alarm. At the best, they rise at long ranges, zigzagging like snipe as the gusts of wind catch them. Or, in the course of a week or so, they begin to pack, and then they are almost as hard to get at as wild geese. The sportsman's best chance is surprising some solitary old cock, who may fall a victim to his selfish habits, but who has an excellent notion of taking care of himself, and will carry away many pellets of shot without falling. Though the ground you are walking over may be almost overstocked, it is no easy matter getting together even half-a-dozen brace under such circumstances. Disappointment settles into something like despondency, faintly tempered by flickers of hope. As you lose faith in the probability of birds sitting within shot, you can hardly help your thoughts wandering from the business in hand; fatigue begins to tell upon the frame in the absence of sanguine excitement; and the muzzles of the gun-barrels weigh heavily on the arm, while the feet are slipping on the damp heather roots. Yet to fire with the requisite precision you must be ever in readiness; the eyes ranging keenly over the heather within gunshot, with arms and trigger-finger quick to respond to them. So much for skill, which is taxed to the uttermost; for a slow and awkward shot may as well give it up and go home. As for luck, that, as we have seen, depends chiefly on the weather, even so far as the actual contents of the bags are concerned. But big bags and much bloodshed are by no means everything; many sportsmen, and especially those in the decline of life, make shooting a secondary consideration on their annual visits to the North. There are strangers who come on visits to the lodges for the sake of the air and the magnificent scenery; and there are ladies accompanying husbands and fathers, and more passionately in love with the moors than anybody. To these hopeful holiday-makers the weather is everything, making all the difference between some weeks spent in paradise or in purgatory. We do not suppose that any rational being, with a soul for the wilder beauties of nature, would wish to have it perpetual sunshine. A cloudless day now and then is almost perfect happiness, but *toujours soleil* would be depressing in the extreme. Were it for nothing else, the murmuring burns would be dried up, while the tiny waterfalls ceased to tumble; the heather would be scorched into a dismal uniformity of brown; the green tresses of the birch-trees would wither and droop like the broad fronds of the bracken under their shadow; and the emerald meadows in the low-lying straths would be parched into a sad harmony of colouring. We need not, however, exercise our fancy in imagining impossible horrors. There will never be any lack of water in the North, and so much the better. We could ill spare the marvellous cloud effects which are the essence of the charm of Highland scenery; and, had we not experienced the wretchedness of protracted rain, we should never rejoice as we do in the glories of the sunshine. Yet, regarding the matter philosophically as we may, none the less

do we long and pray for fine weather, especially for the occasion of our arrival at our quarters. Let us look on the one side of the picture and on the other.

It is the 11th of August, as we may assume, when, having slept in the hotel at the little town where we bid adieu to the railway, we are awakened by the boots for early breakfast. The blinds are drawn up, and through a flying shower, the sun comes streaming in at the windows. The shower is only the pride of the morning; and there is the promise, nay, the certainty, of a splendid day. We look out across the waters of the firth to the range of blue mountains, bounding the northern horizon, with their summits still swathed in wreaths of mist. The light breeze scarcely ruffles the surface of the estuary, while here and there are patches preternaturally calm. The troops of seafowl are swooping and screaming, and a deliciously penetrating odour comes to us from the seaweed strewn on the beach; for it is low water, and the sea shallows slowly, and a wide stretch of the sand is left bare. Delightful as are the sights and sounds and smells, it seems a sin to loiter within doors on such a morning. Breakfast is despatched, and the "machine" is at the door, drawn by a couple of sturdy Highland "garrons," that will have their work cut out for them before they drag us over the hills, with those gun-cases and portmanteaux that are roped on promiscuously. But there is no hurry, for the day is long, and we are willing to perform much of the drive at a foot's pace. Over the first part of the journey the machine makes creditable play, for the road lies on a flat between the sands and the cornfields. Then passing a little local watering-place in the bottom of a romantic glen, and crossing the bridge over the brawling salmon stream, the road begins to wind upwards through heathery hills. Yet every here and there it dips again to rejoin the banks of a river, which threads at long intervals a series of mountain lochs, alternating rushes and cataracts with stretches of calmer water, where it spreads out over the shallows. The shelving banks of many of the lochs are overhung with clusters of feathering birches; now and again we came upon a piece of oak coppice, or on the weather-beaten firs with warped limbs that have twined their knotted roots round the rocks rising abruptly out of the river. Further on and higher up the country becomes more savage. There is nothing but heather to be seen in the foreground or middle distance, except where the purple moors break away into black, watery bogs, or where you may rest the eye, by way of variety, on the smiling pastures of the strath. But on those higher hills framing the pictures on either side and before us, the heather grows thinner and thinner till it disappears in deserts of stone; and above all are peaks and broken precipices or bald scalps of slaty rock. The sun is gilding those rocks and everything else, even throwing a cheerful tinge of yellow over the peat bogs; the shadows from some floating clouds are flecking the sparkling landscape in places, and filling in grey patches on the blue lochs. As you breathe the invigorating air and are dazzled by the brilliancy of the sun glow, you appreciate all the glories of a perfect day in the Highlands. All animated nature seems as happy as your own party—the hawks and carrion crows hovering in the air; the swallows and insects skimming the water; the young broods of game basking on some bank by the roadside, and the wild ducks rising lazily from the pools, or from among the rushes by some of the burns. They seem to know that the guns are stored away in the cases and that shooting does not begin before the morrow. The lodge for which we are bound stands in a decidedly bleak situation. The only wood is a plantation of stunted larches, serving very imperfectly their purpose of a screen; and the only attempts at ornamental grounds are the gravel sweep before the entrance and a "kale yard" within walls of turf. But to-day, with the grey peat smoke curling up against the mountain in the background, and the sunbeams reflected from the lozonged window panes; with the sparrows twittering from the thatch and the ponies switching their flowing tails merrily in the paddock, it looks the very picture of homelike comfort. With a promising sunset and a high glass, you go to bed full of pleasurable hope for the morrow; and should that sort of weather continue for a week or two—occasional showers are welcome rather than otherwise—the days will glide by on downy wings, while you scarcely note the swiftness of their flight.

That is one aspect of a Highland visit, and though it is the aspect that we naturally love to dwell upon, we must glance in conscience at the other. We may cut short the description of a watery drive from the seaside, for the simple reason that next to nothing is to be seen. The firth is veiled in billowy mist, forth from which come the shrill cries of the seagull; and as the road ascends the fog thickens, while what was a dense drizzle turns into a downpour. "Water, water, everywhere!" The burns are pelting down in a brown flood, as in a broaching of bottomless vats of double stout; and the river is rapidly rising in spate. Except for the steep acclivities and sharp descents, you might as well be driving across a heath in Holland, for anything you discern of mountain scenery. You are principally occupied in adjusting your wraps, and draining off the pools that will collect about your person. The machine drags forward diamally like the forenoon; for the saturated roads make heavy travelling, and it is a sore trial for the horses' back sinews. You gather at last from certain familiar landmarks that you must be in the immediate vicinity of the lodge; but you see very little till close upon it. How small and bare it is, and how dreary it would appear were it not for certain happy associations! Doors

and windows have been tight shut, to keep out the driving rain and the damp; and when you step over the threshold into the little passage there is an odour of mingled peat and spirits and cookery and drying garments from the kitchen which opens immediately upon it. The great peat fire, crackling and sparkling on the hearth in the solitary sitting-room, is a pleasant object, and yet, as you look out through the steaming window-panes upon the watery waste beyond, your heart sinks. For you know that you may be kept a close prisoner for days, with sulky company and anxious thoughts, and, perhaps, on a starvation allowance of literature. As for your thoughts, they may well be full of care, since each stormy day as it goes by must make the grouse wilder and less approachable. So that your sport is not only being deferred, but destroyed, unless the elements should prove less unrelenting than seems likely. But it shows what the pleasures of the Highlands must be, that men should be content to pay an extravagant price for them, and yet run the risk of such periods of disappointment.

#### YACHT-RACING

THAT the racing of large, or, as they are commonly called, first-class yachts will come to an end before many years are over seems by no means improbable. For thinking that this may be the case there are several reasons, the first and most obvious of which is the great expense of building and maintaining a modern racer. Such a vessel, so far from being a flimsy craft, as is sometimes absurdly said, must be extremely strong unless she is to fail after a season or two. Most unwisely, as we think, neither the Clubs nor Lloyd's have attempted to put limits to load keels; and without a heavy lead keel a yacht's chances of success in the contests of our days are small. To stand the enormous strain of such a weight very low down, a vessel must have great strength and be well put together, and in shipbuilding good work means dear work. This system of ballasting with outside lead enables a yacht to carry a huge spread of canvas, and the wear and tear on board a racing craft tell heavily on the owner's pocket. The wages usually paid are extremely high, and the very large spars are not infrequently carried away or injured. A most expensive amusement, then, is big yacht racing, probably much more expensive than it ever has been; but, in spite of long-continued bad times and agricultural depression, there are still some rich men left in England; and, if the sport of yacht-racing were encouraged as it ought to be, no doubt a fair number of first-class vessels would be built. Unfortunately it is not, in spite of the numerous prizes that are given, encouraged as it ought to be. Clubs are, in too many cases, niggardly; and those who manage them are so shortsighted that, to save a little money, they habitually take a course which cannot fail to injure yacht-racing. The famous Rule 8 of the Yacht-Racing Association Rules provides that a yacht duly entered shall be allowed to sail over the course if there are no competitors for her. It is scarcely necessary to point out that this ordinance is a perfectly fair and just one. When an owner has had the trouble and expense of bringing his vessel to a port, of engaging his pilot and extra hands, he ought to be allowed to sail over if no antagonists are forthcoming. If a vessel is so good that no others can compete with her, she ought to be the queen of racing waters until a worthy antagonist appears. Against Rule 8, however, the Committees have steadily set their faces, being terribly afraid that their regattas would be spoilt by sails over. A few regattas might be thus spoilt; but in the long run yacht-racing, and consequently regattas, would gain by a wise liberality. How much they have been injured by the mistaken line of action which has been adopted may be easily shown by referring to what has happened with schooners. Schooner-racing has almost become a thing of the past simply because Committees regarded Rule 8 with terrified horror. Five years ago the famous and hitherto unapproached *Miranda* appeared, and in due course of time it became apparent that other schooners had little chance with her. After a while she found few competitors, and was to a considerable extent debarred from taking prizes because the Clubs would not allow sails over. No doubt a series of sails over by a schooner would have made some regattas in part very tame affairs; but is it not obvious that, if the *Miranda* had been allowed to take prizes all round the coast, a vessel would have been built to match her? The *Miranda* is an admirable yacht, undoubtedly the best schooner yet set afloat, but she would not have been allowed to reap a golden harvest during a series of seasons by placidly sailing over a variety of courses. Some yachtsman would have asked a competent naval architect to see whether he could not equal or surpass Mr. John Harvey's masterpiece. As it was, however, any one who contemplated building a racing schooner must have seen that, in the event of the *Miranda's* retiring, he would be left in a position of isolation, and accordingly no such schooner has been built, and schooner-racing has nearly come to an end. No doubt the *Miranda* is so good that she can take part in mixed races over triangular courses with some chance of success; but on such courses cutters and yawls have, generally speaking, an enormous advantage over schooners, for which the rig allowance does not adequately compensate, and, generally speaking, a two-masted vessel is hardly likely to win many flags in these contests. The unwise niggardliness of Clubs has, therefore, caused

big yachts of one kind well-nigh to disappear from racing waters. Yawls and cutters are less affected by it, as they contend on more equal terms, but if the excellent recommendation of the Yacht-Racing Association were attended to, and if class racing took the place of the mixed races, of which there have been so many lately, either the *Latona* or the *Florinda* or the *Samana* might find herself as badly off as the *Miranda*. It can hardly be disputed that class races are much better tests of the merits of vessels than mixed races; but in class races a big craft may at any time be "left out in the cold," and this fact can hardly have escaped the attention of any one who contemplated building a first class racing-yacht.

Another reason against constructing such vessels is the danger which they incur from the strange carelessness which the Clubs often show in fixing their starting lines. The evil seems to grow worse every year. Because modern yachts are remarkably handy, it seems to be thought that vessels of from ninety to a hundred and sixty tons require no more room at starting than twenties. A case of this kind occurred the other day at Southampton, and there was a collision between the *Miranda* and the mark-boat which caused serious injuries to two gentlemen belonging to the Sailing Committee of the Royal Southern Yacht Club. From the decision of the Council of the Y.R.A., which was very promptly given in this case, it seems clear that the *Miranda* was not in fault, but however much or little the *Samana*, which forced her on to the mark-boat, may have been to blame, there can be no doubt that an accident was rendered probable by the extraordinary starting line which was chosen. Now, as we have said before on this subject, men will not expose vessels worth from eight to twelve thousand pounds to the risk of great damage, and at some regattas the risk of damage is by no means small. Yachtsmen are not encouraged to build or race large yachts by finding that, in spite of the general adoption of the Y.R.A. Rules, recommendation No. 7 of the Appendix is sometimes altogether ignored.

There is another cause, however, quite independent of Clubs, which may tend to put an end to the contests of big vessels. It has lately become apparent that forties built according to the most approved principles may contend with their larger sisters with no small chance of success. This was first made evident at the race for all rigs of the Southampton Yacht Club, sailed on the 12th instant. Three first-class vessels, the *Latona*, *Miranda*, and *Samana*, contended, and ultimately the victory lay with the *Samana*; but all through the race the wonderful *Annasona* had her time well on the leading yachts, and when the *Samana* crossed the line the smaller cutter had some minutes to spare, and the *May* was within her time by a few seconds. A similar result followed in the race for the Albert Cup sailed off Southsea on the 15th instant. The prize was carried off by the *Slouthhound*, which beat by time the *Samana*, *Latona*, and *Florinda*, the *Annasona* being disabled by an accident at the start. Now, these were two very remarkable races, but somewhat similar results have occurred before, though probably in lighter and more uncertain breezes than those which prevailed during the above matches. What happened on the 17th, at the match of the Royal Corinthian Yacht Club, in which the *Samana*, *Annasona*, and *Slouthhound* took part, was more noteworthy. The wind was strong enough at starting to prevent the two smaller craft from carrying square-headed topsails, and freshened so much that they had to house topsails, and the *Annasona* had to take in a reef. Nevertheless, she won by time from the *Samana*, and at one period of the race actually reached faster than the larger vessel. Now this certainly was a very astonishing performance, for the *Samana*, admirable on all points of sailing, is for a cutter specially good at reaching, and moreover she is, as we need hardly say, but one year older than the *Annasona*, and represents the latest ideas respecting yacht construction. At Weymouth the *Annasona* would have won again had there been rig allowances. It really seems that, with the present scale of time allowance, a forty-ton cutter may be a most formidable rival to the first-class yachts in breezes such as in former days would have made the chance of the smaller vessels utterly hopeless. At present, no doubt, in many matches the forties cannot enter, but, if it is found that they have a considerable chance of success, a great outcry will be raised. It will be argued, not without considerable plausibility, that a restriction is maintained merely in order to keep out vessels which, if admitted, would probably be victorious, and matches from which the forties are excluded will be likened to that race for the Queen's Cup which every year forms the prominent absurdity of the Cowes week.

Many, therefore, must be the objections which present themselves to the mind of the yachtsman who thinks of building or sailing a large racing craft. There is the enormous and constantly increasing expense, and there are the further difficulties caused by the conduct of the Clubs; while apprehension must be caused by those terrible forties, which in vanquishing greatly humiliate the larger vessels. These considerations can hardly fail to tell, and the tiny racing fleet is certainly more likely to diminish than increase. It is true that an 85-ton yawl, of which report speaks highly, has been launched this season; but her appearance will not improbably cause the retirement of some other vessel, perhaps of more than one; and a new forty may be built during the winter which will prove even a greater scourge to her big sisters than the *Annasona*. On the whole, it seems far from impossible that big yacht racing may practically come to an end. The loss of the finest of sports will be a matter for regret; but it is hard to see how it can be averted with certainty, unless

expenses are diminished, unless Clubs become reasonable and liberal, and unless a new system of time allowance which shall satisfy everybody is instituted—changes not very likely soon to come about.

#### THE DRAIN OF GOLD.

WITHIN the past three weeks a great change has come over the London money market; the discount rate of the Bank of England was raised last week from 2½ per cent. to 3 per cent., and again on Thursday from 3 per cent. to 4 per cent.—a rise of 60 per cent. in eight days. And the outside market has followed the lead of the Bank, or rather it somewhat outstripped it, for during the first half of this week the rate in the open market was higher than the minimum of the Bank. This has been brought about by the beginning of a drain of gold to New York. To some extent, no doubt, the withdrawals of gold on Italian account contributed to the result. But these were small in themselves; and, if they had stood alone, would have had little effect. The real operative cause is the drain to New York, the magnitude and duration of which cannot be foreseen. When the great panic occurred in New York in 1873 the workmen who, under the Protectionist system, had been attracted in crowds to the large cities found themselves thrown out of employment and in danger of starving, and, to avoid the danger, were obliged to migrate to the West, where they settled upon the land, and pushed cultivation into the wilderness at a very rapid rate. They were favoured by abundant harvests. At the same time a series of exceptionally deficient harvests occurred in Europe, and gave rise to a vast demand for American food products. Thus the agricultural development of the Western regions of the United States was stimulated, first by the industrial depression, which drove hundreds of thousands of workmen from the cities to the extreme West, and, secondly, by the demand in Europe for agricultural produce. The agricultural population was greatly enriched, and their prosperity in turn gave a stimulus to trade generally. At the beginning of 1879 a new cause came into operation, which imparted a fresh impetus to the revival that had already set in. This was the resumption of specie payments. Since then the prosperity has gone on increasing until, perhaps, the world has never seen so large a population in such universal enjoyment of well-being. The great activity of trade generated has naturally required a much larger volume of money in circulation than previously sufficed. The immense harvests needed more labour, and the demand for labour, of course, sent up wages. At the same time the movement of the crops from the West to the Atlantic seaboard compelled the railways to employ larger numbers of servants, to run more trains—in a word, to increase the accommodation they gave the public. In like manner, the canals and river steamboat Companies, the dealers in grain and pork and cattle, the wharfingers, and, in short, all engaged in the trade, had to employ additional labour at higher wages. The cessation of famine in India just then also restored prosperity to the cotton industry, and consequently augmented the demand for American cotton. In addition to all this, the construction of railways, suspended since the panic of 1873, was resumed with greater activity than before. The growth of population, the increase in the area under cultivation, the rise of new cities, the settlement of new territories, and the accumulation of wealth, rendered necessary additional railway accommodation, and the American people threw themselves into the work with their usual feverish activity. It is estimated, for instance, that in the current year not less than ten thousand miles will be added to the railway system of the United States. The rise of wages which we have been tracing brought with it a rise of prices. And, furthermore, for some time there has been great speculative activity in the stock markets, such as we have witnessed here at home. In all these ways there has been a vastly increased demand for money. Every employer of labour has had to pay, not only more workmen, but higher wages to each; and, although the banking system of the United States is highly developed, and banking accommodation extends even to the new Territories, the banking legislation of the United States does not favour the expansion of the bank-note circulation, and thus coin has had to fill up the place not occupied by paper. According to a return just furnished by Mr. Knox, the Comptroller of the currency of the United States, the circulation of the United States at present amounts to no less than 286,102,170*l.*, of which 104 millions sterling are in gold and about 34½ millions sterling in silver coin. Nearly the whole of the metallic currency, in the aggregate, as we see, almost 138½ millions sterling, has been added to the circulation since the beginning of 1879. Previously to that year, as our readers will remember, the money of the United States consisted for eighteen years of inconvertible paper. Soon after the Resumption Act was passed in 1875, the Secretary of the Treasury set about accumulating gold to serve as a reserve when resumption should be carried out; and therefore for about six years the whole produce of the gold mines of the United States has been retained in the country. At the same time there has been taken from Europe during the past two years about 35 millions sterling in gold, while, since the passing of the Bland Act, the greater part of the silver production of the United States has also been retained at home.

It would have seemed probable that this enormous increase of

the currency would have sufficed for all the needs of the United States, although it is true that in the past ten years over 10 millions have been added to the population, and emigrants are pouring into the country at the rate of nearly two thousand a day. It seems, however, that the inflation of prices has gone on even more rapidly than the addition to the currency, and that still more money is wanted. Accordingly, the drain which we witnessed last autumn and in the autumn before has again set in, and during the past fortnight about 2½ millions sterling in gold have been shipped from London, Paris, and Amsterdam to the United States. According to all appearance, too, the drain is likely to go on for a considerable time longer. To some extent this demand for gold in the United States is being caused by the attack upon the President's life. It will be recollected that in the spring Mr. Windom, the Secretary of the Treasury, succeeded in refunding the Five and Six per Cent. Bonds falling due this year at the reduced rate of 3½ per cent., and he decided to pay off out of the surplus revenue accumulated in the Treasury about 19 millions sterling of these bonds. A portion of these were called in and paid off in July, and another portion in the early part of the current month, but the rest do not fall due till the 1st of October. Mr. Windom has felt himself bound to keep in the Treasury enough of gold to pay off the holders of these bonds, should they present them at the beginning of October. Had the President been in good health, there is little doubt that, when the stringency in the money market of New York set in, he would have authorized the Secretary of the Treasury to offer to redeem the whole of the bonds at once, with the object of relieving the money market. But during the illness of the President it is not possible to call together a Cabinet Council, and without authorization from the President or from the Cabinet, Mr. Windom long hesitated to take the step which he must have seen was advisable. At length, however, he has decided to pay off without rebate the holders of Five per Cent. Bonds falling due on the 1st of October. It is too soon yet to know how far this decision will affect the money market. The holders of the bonds are not always those who want money, or who can employ it to the most advantage in the short loan market. Many of them may therefore prefer to keep their bonds, receiving up to the 1st of October the full interest at the rate of 5 per cent. per annum; consequently it may be that the relief to the market will not be as great as at first sight it promises to be. Still, the offer in itself will have a reassuring effect. Some of the holders may reasonably be expected to take their money and surrender their bonds, and the money which is paid out of the Treasury will help to relieve the market. It would further appear that just now the consumption of commodities in the United States is enormously increasing. During the past three weeks, for instance, gold has been withdrawn from the New York Associated Banks at the rate of about 940,000*l.* a week, making a total withdrawal of about 2,820,000*l.* in the three weeks. In the corresponding three weeks of last year the amount so withdrawn but little exceeded 800,000*l.*, and in the corresponding weeks of 1879 the amount was only about 650,000*l.* As it is much more convenient and much cheaper to remit paper than to remit gold when the purpose is to make payments in the interior of the Union, it is probable that these large withdrawals were not intended for remittance to the West or South, but to a large extent were for the purpose of paying Customs duties on goods which were previously warehoused, and which are now going into consumption. If this be so, it is clear that, were the President in good health, he would take steps to pay out the coin which is locked up idle in the Treasury. At present it is as absolutely out of the reach of the money market as if it were sent out of the country. Last year and the year before Mr. Sherman relieved the market by large purchases for the Sinking Fund. But at that time the President was in good health and Cabinet Councils could be constantly held, whereas now whatever step Mr. Windom takes he has to take on his own responsibility. As he is new to office, it is natural he should not like to risk unusual responsibility, especially as large claims for the redemption of bonds will come upon him on the 1st of October.

As to the probable amount and continuance of the drain, we are inclined to think that it will be considerably smaller than in the past two years. Both last autumn and the autumn before the withdrawals exceeded 15 millions sterling. But we are inclined to think that in the present autumn little more than half that amount will be taken. One of our reasons for this opinion is the enormous increase of the currency of the United States, which we have shown above. In two years and eight months the total amount of cash in the country has been nearly doubled. It is in the highest degree improbable, therefore, that very much more money can be needed for the purposes of trade. Another reason we have for our opinion is the large amount of money which the Secretary of the Treasury is bound to pay out within the next couple of months. As we have been showing above, the stringency in the New York market is partly caused, or, at least, is aggravated, by the large payments of gold out of the banks into the Treasury, the money so paid in being there kept, locked up and idle. But the Secretary has still to redeem in the course of the autumn about eight millions sterling of debt. The letting out of so large a sum must relieve the market, and, therefore, render unnecessary such immense imports from Europe as took place during the past two years. Furthermore, we are inclined to hope that, instead of taking gold this autumn, the Americans will, to some extent at least, rather take goods from this country. As we have been pointing out, the consumption of goods in the United States is very large at present and seems to be

increasing rapidly. If the money market does not become so dear as to injuriously affect trade, this demand will increase, prices will rise, not improbably until they reach the level which will admit of considerable imports from this country. The enormous construction of railways, to which we have already referred, is necessarily raising the price of iron and steel, and we hope to see before the year is out a considerable demand for British steel and iron. Moreover, it is to be borne in mind that the debt due from Europe to the United States will not be as much this year as it has been during the past two years. The American harvest is not as abundant this year as for some years past, while European harvests are better. Unfortunately, the weather we are now having is injuriously affecting our own harvest; but, in any case, Europe will have larger supplies than it has had for some years back. Therefore, it is to be assumed that the debt due from this country to the United States will be less, and consequently that the United States will not have the same power of taking gold from us. Lastly, if the drain of gold should continue, and should make money dear in London, it may be taken for granted that the export of gold to the United States would be stopped. There would be no profit in taking gold from a dear market to send it at a considerable cost to another market where it would not give a larger profit.

#### THE THEATRES.

THE new play, *Sedgemoor*, by Messrs. W. G. and F. O. Willa, given at Sadler's Wells on the 20th, is very properly divided into four acts. As it really consists of two quite distinct plots, each of which has a half of the play to itself, the equal division makes it easy for the critic, and perhaps at some future time may make it convenient for the authors, to reduce it to its natural elements. By the addition of a few lines the first half might be made into a melodrama complete in itself. The second half might then be made into a comedy of intrigue by the somewhat longer process of making the characters probable and the dialogue natural. As it is, the two are essentially independent of one another, though artlessly tagged together, and the characters are mere mouthpieces for the sort of humour and sentiment which was thought likely to appeal to the pit and gallery of Sadler's Wells. As the piece stands, the first is by much the better of the two parts. It is not that the melodramatic incidents possess the merit of originality, for every one of them has been drawn from that fund of recognized stage effects which is the common property of all playwrights; but they are combined with a certain dexterity, and, helped by a little good nature on the part of the audience, make a very tolerable whole. A Somersetshire gentleman, of the name of Sir Gilbert Evelyn, has taken the convenient opportunity of Monmouth's revolt to be absent from home without informing his wife of what he is doing. Before his return Monmouth reaches his house wounded and lying in disguise, and persuades Lady Evelyn to hide him, under promise that he will leave as soon as the husband returns. Scarcely is he safe in the cupboard, which has hidden so many inconvenient people on the stage, before Sir Evelyn does come back and gives his wife, or rather the gallery, a very high-flown account of the battle—so called—of *Sedgemoor*. His narrative is adorned with many contemptuous speeches about Monmouth. Lady Evelyn is engaged in persuading her husband to leave the house when a party of soldiers, under command of Sir Gilbert's old friend, Colonel James O'Brien—a comic Irishman with a song—arrive and propose to search. On the assurance of Lady Evelyn, an assurance that Monmouth is not there, given after a delay that should have aroused the Colonel's suspicions at once, the King's officer weakly agrees to make no search. But Lady Evelyn's son betrays the secret by calling attention to a stain of blood on the ground where it has fallen from Monmouth's wound. The concealed rebel is discovered. Sir Gilbert, like so many husbands in melodrama, takes his wife's fault on himself, and is consequently handed over to the tender mercies of Joffreys. Here ends the first act, with an effective "curtain." The action of the second passes at Court at Whitehall, and begins already to wander somewhat from the directness of the first. Various historical characters are introduced under strange disguises. Mary of Modena, who made such a good thing out of selling the rebels to the planters in Barbadoes, appears as a sovereign full of tender compassion; Father Petre, more appropriately as the wily Jesuit of tradition; Catherine Sedley, as the young and beautiful mistress of the King, to the ineffable surprise of Sir Gilbert Evelyn, who must have been strangely innocent for an ex-guardian of those days; and, most wonderful of all, Sunderland, as an empty-headed fop. All these persons engage for different motives; Sunderland, because he wishes to seduce Lady Evelyn; Catherine, because she loves Sir Gilbert; Father Petre and the Queen, because they wish to ruin Catherine, in attempting to save Evelyn. But, in reality, they have nothing to do with it, and are there only to supply the "germs" for the third and fourth acts. Sir Gilbert is saved by the extraordinary skill of Lady Evelyn in cross-examining Monmouth, who is made to confess in that last interview of his with his uncle, that it was she who hid him.

We confess our inability to follow the story from this point. The stream of the plot branches out into a species of delta. The intrigues of Petre, of Catherine Sedley, and of Sunderland keep on clashing together till the arrival of the Prince of Orange puts an end to the play. Sir Gilbert Evelyn, who is a greater fool

than any of Wycherley's country husbands, is persuaded that his wife is false. He lives with the King's mistress without the King's knowledge, intrigues with the Prince of Orange while remaining a friend of the loyal Colonel O'Brien, is condemned to death without trial for each of these offences, repents of his misconduct to his wife, and is saved in the nick of time.

As, at least in part, the work of one of the few writers who are supposed to prove that the dramatic literature of England is not quite dead, *Sedgemoor* should be entitled to be judged as literature. But, as far as it proves anything, it is that the playwright of to-day considers that his craft privileges him to neglect both style and character. If he combines a certain number of situations into a more or less coherent story, so as to put the strong ones at the ends of the acts, that is enough. That the *dramatis persone* should have some approach to reality, and that their talk should be in the English of this or any other time, is apparently not thought necessary. The dramatist may deal as he pleases with the mere facts of history, and we care very little that Mr. Wills makes Monmouth say that his death will leave his father childless; nor is it any great matter that intriguing with a king's mistress is represented here as a sort of high treason, and that the articles of war are supposed to be in force in James's army. But the characters and the language of a time are not to be played with. No novelist would be pardoned for making an empty fribble of Sunderland; and, if he ventured to introduce Catherine Selley, he would be held to be bound to invent some wit for her, though, historically speaking, he might be excused from making her beautiful. But Mr. Wills has no scruple about dubbing two mere dummies with these well-known names. As for the English of the play, it belongs to no period whatever, being merely Mr. Wills's variation on the sham Elizabethan style of Sheridan Knowles. With an abundant literature at their hand to show them how the English of 1688 talked, the authors of *Sedgemoor* make their personages use the wonderful conventional style of Knowles's "poetic drama," which is on a par with that of the historical novels published weekly with illustrations for the benefit of ingenuous youth. Messrs. Wills are so overpowered by the necessity of being poetical, that they cannot let Lady Evelyn talk about the avenue to her maid without calling it "yon vista of ancient elms." Sir Gilbert swears "by the rood," and all the rest of the conversation walks on the same high stilts. Of the rendering of the parts it is not necessary to say anything, except that it is a fine specimen of the kind of acting in which a violent pose and a loud voice express all and every emotion.

*Claude Duval: or, Love and Larceny*, was obviously composed to give the largest possible number of young persons, in very short dresses of more or less crude colours, the greatest possible number of opportunities to troop on and off the stage of the Olympic. The piece, which is described as "A New and Original Romantic and Comic Opera," is, however, no doubt also intended to have a plot. There is a story—a series of incidents which follow one another without much apparent connexion, and which in succession give occasion for a song and the appearance of the young persons aforesaid. Claude Duval's hand captures one Charles Lorrimore, who is flying from a prosecution for high treason for the crime of being an adherent of Lord Clarendon's. The capture is a fortunate thing for Lorrimore, for Claude Duval turns out to be his friend, Sir Harry Villebois, with whom he has "ruffled it" in town. The friendly highwayman at once puts himself and band at Lorrimore's disposal to secure his escape, and obtain for him his lady love Constance, niece to one McGruder, a Puritan of the regular stage type, whom the fortune of war has put in possession of Lorrimore's family estate. By the most fortunate chance in the world, Duval is engaged in a scheme to rob McGruder. From this convenient beginning the events follow their natural course. The robbers go to McGruder's, or rather Lorrimore's, estate of Mildon Manor, and soldiers come after, not them, but the fugitive lover—how directed does not appear, but very conveniently for the production of situations. They are accordingly produced. The generous Claude very unnecessarily allows himself to be captured in Lorrimore's place. Of course he escapes, also of course the robbery of Mildon Hall brings about the discovery of title-deeds which put Lorrimore again in possession of the home of his ancestors, a pardon arrives just at the right moment, and all ends happily.

The thread of this not very remarkable story is spun out by various incidents. McGruder, his sister, and niece are captured by the robber gang in the first act to afford a chance for a very indifferent copy of what the playbill, perhaps ironically, calls one of Mr. Frith's "wonderful" pictures. A great deal of time is occupied by McGruder's sister, Mistress Betty, who is that theatrically useful character a middle-aged coquette, subdued by the "new and original flattery" of being told she might be her niece's sister. The choruses and songs, all to airs which sound very much like an echo of some one passage of Offenbach's music, take up a certain amount of time. But the predominating feature of the piece is the chorus of "village maidens" in the short dresses. They keep coming on at every moment, standing aimlessly round the other characters, or going through a series of constrained swayings of the body called "incidental dances." The actors loyally did their best for the jests of the piece. They paused before them to attract attention, and then brought them out like pistol shots; but, in spite of their efforts, Mr. Stephens's puns were very dreary. The performers seemed to suffer from a depressing sense that no exertions of theirs could infuse life into their parts or music, and that was perhaps

the efficient cause of the flatness of their acting and singing. Not even the horse on which Claude Duval rode on to the stage could atone for the continual presence of Joe Miller and the disfigured ghost of Offenbach who are, between them, the real authors of the piece which bears the name of Messrs. Stephens and Solomon.

## REVIEWS.

### BREWER'S ENGLISH STUDIES.\*

THIS collection of the late Mr. Brewer's minor works—for the main part of his work, we need hardly say, must be sought in the publications of the Record Office—will be welcomed by all English students who believe enough in their own language, history, and letters to think them worth taking seriously. Those who expect essays to be amusing, in the nineteenth-century sense of the word, will indeed scarcely be satisfied by this volume, though it has precisely that kind of interest for cultivated readers which our fathers of a century ago did call amusement. Mr. Brewer's historical judgments may cause graver searchings of heart in some quarters. His consummate knowledge of the facts and materials of English history is beyond dispute. But it is easy to see that he was in no wise in sympathy with the school of which our chief living historians stand at the head, whose method and results have been popularized by Mr. Green's *Short History*, and which is followed by a great majority of recent writers on the subject. We cannot find that Mr. Brewer ever openly broke a lance with Mr. Freeman or Professor Stubbs; but he fell upon Mr. Green in the *Quarterly Review* with something like a furious joy of battle. It is not our purpose to discuss the merits of either this controversy or the unsparing criticism of Macaulay, not the less pointed for not being always express, which runs through the essay on the Stuarts. We can only remark in a general way that Mr. Brewer shows now and then at least sufficient bias to counteract that of the Whig historians whom he censures; and that, when he endeavoured to reduce that lamented and ill-used monarch James II. to nothing worse than a well-meaning and respectable bore (but such a bore that it was a positive virtue in Charles II. to endure him), Mr. Brewer must have for the moment forgotten the existence and contents of a document of some historical and constitutional importance which must have been not unknown to him—we mean the Bill of Rights. But all this may not unnaturally be disheartening to a young reader. He may say to himself, "Here have I been all this time learning history from the most approved masters, and on what I was given to understand was the latest scientific method. I am well up in the *Norman Conquest*, and the *Constitutional History*, and the *Select Charters*, to say nothing of essays and minor works of my masters like the *Growth of the English Constitution*. And here is an equally learned person, who has passed a lifetime in original historical work, and tells me it is all wrong. Here are the latest doctors disagreeing over the Stuarts, just as people did when the Jacobites had barely ceased to count in practical politics. Is not this new scientific study of history altogether vanity? The old-fashioned sort of history was less troublesome, and, after all, not much less true."

After some such manner we may conceive an ingenuous young man to commune with himself; and we can conceive that, unless his teachers have been careful to mark the limits of what they could teach, his soul may be disquieted for a season. If he has been taught dogmatically to accept the results of a real master's work at second or third hand without entering into the master's evidences and reasons, his faith will probably be shaken, and it is quite right that it should be. If, on the other hand, he has been taught to verify and encouraged to criticize, he will know that the business of history is to give the truest account that can be attained of human actions and motives, not to supersede individual judgment of them. So long as men differ in their opinions of the public men and affairs of their own time, so long will they also differ as to the public men and affairs of the past, nor will any possible completion of our knowledge prevent them from differing. It is true that we know many things which the actors in a great historical crisis could not know as we do. The counsels of both sides, the confidences of statesmen, the reports of indifferent observers, or of foreigners intent on purposes distinct from those of either contending party, lie open to us. But, on the other hand, the actors knew much that we do not know, nor can we see things as they saw them. It is almost impossible for an English lawyer, looking back two centuries and a half, with the Bill of Rights and the Act of Settlement between, to realize how the legal disputes of the Crown and the Commons under the first two Stuarts would have appeared at the time to a judge really anxious to be impartial. The same causes which lead men to take sides on questions of their own time, make the material facts are notorious or easily ascertained, and lead them to do the like as to questions of past history. It is impossible for a man from being a *historian*, from detecting the impossibility of a version of facts which may once have been true, to

\* *English Studies on English in English Literature*, by the late J. A. Brewer, M.A., &c. Edited by Henry Wace, M.A., &c. London: John Murray.

it will not hinder him from adhering to one party more than the other. It is easier to be judicial as to past events, not so much because we are better informed, or because our feelings are less affected by them, as because there is no immediate pressure on us to make up our mind. The moral and political interpretation of facts remains a matter for each man's moral and political temper; it cannot be reduced to a possession of positive knowledge. In short, the lesson we find in the antagonism of the late Mr. Brewer to other leaders in English historical study—we may as well avow for our part that they are *nostra scholæ antea*—is that both those who are misguided enough to teach opinion instead of fact, and those who are unfortunate enough to learn it, are exposed to considerable discomfiture sooner or later.

Leaving the more or less debatable ground of the essays dealing with controversial politics, we turn to the other features of Mr. Brewer's work. Under the title of "New Sources of English History," there is a most interesting account of the Record Office and its contents; a subject on which no one was able to speak with fuller knowledge than Mr. Brewer. The following passage may be taken as a representative one:—

The collection is enormous. Into this vast receptacle the Law Courts, the Treasury, the Admiralty, the War Office, the Home, Foreign, and Colonial Departments, have disgorged their voluminous contents. The public acts of this nation, from the Domesday of William the Conqueror to the Coronation Oath of Queen Victoria, the publications of the great machine of government, with all its complex operations, are here chronicled and recorded in all their immense variety from day to day and from hour to hour. Here is to be traced the open and the secret history of the nation; its transactions at home and abroad; its most subtle and mysterious negotiations; the employment of its treasures; the number and disposition of its forces; the numbers of its population; the distribution of its land, its forests, and its manors; the rise and progress of its nobility and great families; its proceedings in Parliament; its charter, its patents, its civil and criminal judicature. Whatever, in short, this kingdom has for eight centuries done or proposed to do by the complicated functions of its Government and Administration, restless as the sea and multitudinous as the sands upon its shore, is here committed to safe, silent, and impartial witnesses. Stored up in iron gratings, classified and arranged, preserved, as far as human skill can preserve them, from innumerable perils, the public records of this kingdom now slumber in their new repository of stone and iron undisturbed except when removed from their shelves to gratify the curiosity of the antiquarian or assist the researches of the historian.

With materials so vast, yet so important, two questions have perpetually arisen from early times: first, how are they to be most carefully preserved? and next, how turned to the best account? Happily the nation has suffered little from foreign invasions. Such misfortunes as have overtaken Strassburg, and destroyed its libraries and its manuscripts, are comparatively unknown here. Even in the Civil Wars of the sixteenth century, and in the Great Rebellion of the seventeenth, though the rage of party might dismantle or destroy mansions, monasteries, and cathedrals, it left uninjured the national monuments. Whether Roman, or Protestant, Cavalier or Roundhead, gained the ascendancy, all alike in turn respected the archives of the kingdom, and preserved them from sacrilegious violence. Their worst enemies have been of an ignominious kind—rats and mice, fire, damp, and mildew: the negligence in some instances, the misplaced confidence in others, of those who were appointed to preserve them. Dispersed in various quarters of the metropolis, some at the Tower, some at Carlton Ride, some in the Chapter House at Westminster, others at the Rolls House; exposed to weather, dust, and smoke; stowed away in such boxes, and hampers; unmanageable from their vastness and unwieldiness; little known, and therefore attracting little attention—successive Governments were contented to believe that these monuments were in some sense preserved, and equally contented that they should be of no use to any one.

The explanation of the peculiar social and personal interest of the State Papers of the sixteenth and seventeenth centuries is also worth citing. In those times "it was the custom of the Government of this country to confiscate all the letters and papers of attainted persons, without distinction. Thus it was that the diaries, the household accounts, the private correspondence of the accused were transferred to the Exchequer, and there they remain to the present day." The principles on which the Calendars of State Papers have been arranged and edited are fully explained in the course of the essay. A still more interesting essay, perhaps, is that on Hatfield House. Details are given, partly from papers in the Record Office, partly from MSS. preserved at the house itself, of its building under Robert Cecil's direction; and from this Mr. Brewer passes on to the political correspondence in the same collection—"a visible and material bond that brings the present, by undying sympathy, into close proximity with the past"—and proceeds to a spirited and closely-reasoned vindication of Cecil's character and policy, particularly as concerning his dealings with Essex, whose misfortunes were brought upon him, as Mr. Brewer contends, almost entirely by his own want of "a little temper and a small modicum of discretion." The romance of the Queen's ring and the Countess of Nottingham is dismissed as altogether incredible, both from its intrinsic difficulties and from the lateness of its first appearance. By the way, a ring purporting to be the identical one in question was exhibited to the Archaeological Congress at Bedford the other day. "The bricks are there to testify it, therefore deny it not."

In the essay on Shakspeare, followed by a more popular lecture on the study of Shakspeare, Mr. Brewer goes into various matters in which, though what he puts forward is often striking and generally sound, his mastery is less assured than in the strictly historical field. One fact of some importance unknown to the Shakspeare commentators is brought to light by the aid of unpublished papers in the Record Office—namely, that the Lucys of Shakspeare were not merely private enemies of Shakspeare on the stage, but had a standing feud with the family. With regard to the supposition that Shak-

speare spent much of his time in patching up other people's plays, which had already been broached when Mr. Brewer first published this essay ten years ago, and has since waxed to a monstrous growth under the care of the "New Shakspeare Society," it is pointed out in a note that, considering the rapidity with which Shakspeare's undoubted work was produced, it is incredible that he should have had time or occasion to do anything of the kind. In the lecture (originally delivered to a Shakspeare Reading Society at King's College, London) consideration of the advantages to be derived from reading Shakspeare aloud leads to a digression of two or three pages on "the singular indifference with which the human voice has been treated" in modern English education. Mr. Brewer complains that those who do profess to teach elocution attend too much to emphasis and too little to modulation, which is likely enough to be true. He even suggests that it is a defect in modern languages that they need emphasis at all. In Greek it was sufficiently marked by the relative position of words in the sentence, and the speaker had nothing left to modulation to think of. And in our own day, we may add, any one who attends to good French speaking or recitation will hear that a Frenchman, as a rule, has much more of modulation at command than an Englishman, and relies much less on emphasizing particular words. But there is no reason for treating emphasis and modulation as natural enemies, which Mr. Brewer almost does. Still less can we follow the learned author in a note appended to this lecture, where he finds a new and profound moral significance in *Romeo and Juliet*, holding that Shakspeare's true intention in that play was to expound a social and religious theory of wedded love. However, every writer on Shakspeare is entitled to at least one paradox.

The essay on the Royal Supremacy brings us back to historical ground. It is less extensive than its title would naturally import, being in truth a demolition of Mr. Froude's apotheosis of Thomas Cromwell. In "Passages from the Life of Erasmus" we have a sketch of Erasmus's work in New Testament criticism. The difficulties of a sixteenth-century scholar are vividly brought before us by Erasmus's journeyings. He had once to go with great reluctance, and at great inconvenience, from Brussels to Basel, facing the three things he detested in Germany—the stove, the thieves, and the plague—to get his Greek Testament printed, because there was no fount of Greek type in the Low Countries. A lecture on the study of history, delivered by Mr. Brewer at the Working Men's College, is rather disappointing; it contains over-coloured statements of the race-theory of history which Mr. Brewer would hardly have cared to defend in more finished work. On the other hand, the lecture on the study of English history which immediately follows it is very good. Mr. Brewer's advice to people who really want to learn the history of England is to construct their history for themselves before they read systematic books at all; and he points out how it can be done to good purpose without using any but the most easily accessible materials. The advice was given to working men; but we think schoolmasters who wish to train their pupils' mind and judgment, and not merely stuff their memory, may find in this lecture of Mr. Brewer's some profitable hints for their teaching. We cannot repeat the details here; but the principle is to mark down the leading and undisputed facts, have them always at hand, and think over them for oneself. "Take care of the great facts," said Mr. Brewer, "and they will take care of the little ones"—a saying as true as it is full of comfort for the unlearned, with which we may fitly close this notice of a learned man's remarks.

#### IONIAN ANTIQUITIES.\*

THE fourth volume of the *Ionian Antiquities*, which follows its last predecessor after an interval of forty years, contains a fuller account, for which the expedition of Mr. R. P. Pullan has furnished materials, of those temples in Priene Teos and the Troad which have for so many years occupied the attention and consumed the funds of the Society of Dilettanti. This new volume must be regarded in close connexion with those which preceded it, and of which it is the complement, possibly the last chapter; and we must judge it in this light. From the first the excavations and the publications of the Society of Dilettanti have had a character peculiar to themselves; and we therefore prefer, before speaking of the book which is our immediate subject, to say a few words as to the history of the Society which brings it out. And we do so the more readily because the Society of Dilettanti is not one which chooses to thrust itself into notoriety, but is content to do good work slowly and unostentatiously, after the fashion of bygone times.

The Society was founded in 1734 by some gentlemen who had travelled in Italy, and was intended to be at once a social club and to operate for the encouragement at home of those artistic tastes which had given the members so much enjoyment abroad. A bias towards dining has always marked the Society; and, when we look over the names of the early members, we may judge that the high thinking encouraged by it was not accompanied by plain living. But in a few years a disease crept into the Society, and, as often happens in the case of individuals, stimulated it to take exercise. This disease was nothing less than a plethora of money. In 1764 the members,

\* *Ionian Antiquities*. Vol. IV. Published by the Society of Dilettanti. London: Macmillan & Co. 1881.

after proposing various plans for disposing of their superfluous funds, resolved to send "a person or persons to certain parts of the East to collect informations relative to the former state of those countries," and in particular to procure exact descriptions of ruins. The party sent out consisted of Ohandler, Ravett, and Pars, and the expedition had very valuable results. Pars in particular, being a young draughtsman full of talent and energy, did good work. At Athens he had himself slung aloft close to the frieze of the Parthenon, to the great disgust of the Turks dwelling on the Acropolis, whose inmost recesses he overlooked from his lofty station. There he made exact drawings of the Panathenæic frieze, which are still of great value to the archaeologist. From Athens the party went on to Ionia, and there discovered in the temples of Teos and Priene a field for the activities of the Society which had sent them out, as well as materials for the first volume of *Ionian Antiquities*, which made its appearance in 1769. This publication seems to have given a bent to the hitherto somewhat random efforts of the Dilettanti. Henceforward they took as their province Attica and Ionia, and in those districts mainly confined their attention to the remains of ancient temples. It is true that, though from the sumptuous plates with which the huge folios of the *Ionian Antiquities* are so liberally provided we may gather information as to the schemes of ancient cities, their theatres, agoræ, and gymnasia, nevertheless the chief attention of the editors has always been concentrated on the religious buildings.

In 1812 took place the second expedition equipped by the Society, the party consisting of Gell, the "rapid Gell" of Byron, and the architects Gandy and Bedford. The results of their researches in Attica and on the Ionic coast were given to the world by the Dilettanti in two splendid works—the *Antiquities of Attica*, and the second and third volumes of *Ionian Antiquities*. At about the same time they also published two volumes of plates of ancient statues in public and private collections in England, prefaced by dissertations by Richard Payne Knight on the history and meaning of ancient sculpture. And at a somewhat later time (1851) they brought out, in a style worthy of it, the beautiful and complete work of Penrose on the *Principles of Athenian Architecture*.

The third expedition of the Society was sent out in 1862, under the direction of Mr. R. P. Pullan, who made excavations and researches at Teos in 1862, and in 1866 at Priene, on the site of the temple of Athene Polias, and on that of the Temple of Apollo Sminthius near Hamaxitus in the Troad. The task set before Mr. Pullan was the more complete examination of the same temples which had been before visited by the agents of the Dilettanti, an examination carried on alike with spade, measure, and pencil. As an excavator Mr. Pullan at Priene was not brilliantly successful, although many important inscriptions and some sculptures of value have been recovered, and liberally presented by the Dilettanti to the national collection. But as an exact and careful investigator, both at Priene and elsewhere, he has merited the highest praise.

The recently-published volume contains a number of plates and woodcuts, the latter mostly from photographs of sculpture, the former from drawings by Mr. Pullan and Mr. Falkener. These plates furnish the architect with every detail which can be ascertained in regard to the three Ionian temples investigated. The text includes, besides Mr. Pullan's report of excavations, a paper by Mr. J. Fergusson on the origin of the Greek orders of architecture, short histories of Priene and Teos by Mr. C. T. Newton, a memoir on the proportions of the several temples by Mr. Watkins Lloyd, and a paper by Mr. Penrose on the entasis and height of the columns of the temple at Priene.

On the first page of the work, in the preface, we notice two considerable inaccuracies. The expedition of Ohandler is assigned to the year 1734 instead of 1764; and the second volume of *Ionian Antiquities*, published in 1797, is said to be the outcome of Gell's expedition of 1812. Mr. Fergusson's dissertation, which comes next, would require for satisfactory discussion more space than we can spare. We confess that a bold piece of theorizing seems to us oddly out of place in a monumental volume and on a folio page. We are so used to reading sweeping statements and novel imaginations in an octavo that there they do not shock us; but there is something so solemn about the vastness of these folios—such a deliberate intention about them of lasting for all generations, and looking fresh a century hence—that we cannot help wondering at Mr. Fergusson's boldness in choosing such a vehicle for his theories. Not that we are disposed to quarrel with them in the main, however we may object to a passage here and there, more particularly perhaps to the foot-notes. Mr. Fergusson maintains an entirely Egyptian origin for the Doric order of architecture, and treats with summary contempt the views of those who suppose that it arose out of wooden construction. And certainly the argument on which he most relies—the progressive attenuation of the Doric pillar in the course of Greek architectural history—does seem to show that the original which first suggested it was of rock or brick rather than of wood. Nevertheless there are in Doric construction certain reminiscences and traces of wooden architecture which require a more careful explanation than Mr. Fergusson is disposed to give them. As to the derivation of the Ionic order we more readily agree with him.

Mr. Newton's historical sketches are, as a matter of course, thoroughly good and scholarly. To his dissertation on Priene a charming bit of historical colouring is lent by the account of the discovery of the coins of King Orophernes. It appears that in 1870 Mr. Clarke was at Priene, and visited the site of the Temple of Athene. As he stood amid the stones of the base whereon the

colossal statue of the goddess had stood, stones dragged out of position by Greek masons in their Vandalic ravages of the site, he saw on the ground a coin which turned out to bear the portrait (and a wonderfully fine portrait) and the types of Orophernes. On searching he found other coins of the same king, all placed under the stones of the base itself. Now it seems from this probable that King Orophernes dedicated the statue of Athene erected on the base. Turning to history, we find it recorded that Orophernes was a claimant of the throne of the kingdom of Cappadocia about B.C. 160, and that he deposited a sum of 400 talents with the people of Priene—a trust which they kept with a fidelity unusual in antiquity, choosing rather to incur a war with Ariarathes, who was then actual ruler of Cappadocia, than to give up to him the treasure. History tells us that the Prienians at last restored the deposit to Orophernes himself, but does not tell us what reward they received for their honesty. But this silence of history is filled by the testimony of a handful of coins, which show that the Cappadocian in gratitude presented to the people of Priene and their goddess, in whose temple the money had very likely been kept, a colossal statue of the Deity herself. Little discoveries like this help wonderfully to give vividness to ancient history. It is also interesting to note that, according to the testimony of Pausanias, the colossal statue of Athene Polias at Priene was an admirable work of art; for this proves that artists of Asia Minor were capable in the middle of the second century B.C., a time usually supposed to have been one of great artistic barrenness and degradation, of producing a colossal statue which won continued admiration even in the critical days of the Antonines, when there was so strong a prejudice in favour of what was archaic in art. After well weighing this fact, we shall be less astounded at the beauty of the Pergamene sculptures recently acquired by the Museum of Berlin.

The remaining chapters, which mainly consist of dissertations on proportions in Greek temple-architecture, we must leave to the judgment of the few who have specially studied such matters. An examination of Greek temple-building finally resolves itself into somewhat complicated arithmetical computations. Unfortunately, in the case of these Ionian temples the data are to a large extent wanting, many important members of all having entirely disappeared, so that the results of Mr. Lloyd's calculations can at best be only approximative. It is, moreover, noteworthy that canons of proportion are not so closely observed and followed by the architects of these Asiatic temples as by those who planned the Athenian masterpieces.

On the whole one cannot but be proud, from a national point of view, of the publications of the Society of Dilettanti. A club of private English gentlemen, they have produced works which, in completeness and in costliness, deserve to stand by the side of the state-aided publications of foreign countries, even those of Russia. Although the main object of the Society has always been of a social character, it has enrolled among its members some of the best names in classical archaeology of past days, and quite recently has received into its circle some of our ablest younger Grecians. If it is now disposed to continue its activity in the same line, or even to extend it, the field lies very open. Greece may be said to be overrun as a field of archaeological discovery. If a statue shows its head in Athens, it is pounced upon and fought over by members of the French school, members of the German school, members of the Parnassus Society, and a crowd of miscellaneous aspirants. But Asia still remains, though it is impossible to say how long it may continue open. Cyprus, Æolis, Phrygia, all invite research, and would furnish remains of inestimable value. If the Dilettanti chose to be active, their command of funds would enable them to attain much on which younger and poorer societies, such as that lately founded for the "Promotion of Hellenic Studies," can only cast their eyes with longing.

#### LIEUTENANT BARNABAS.\*

MR. BARRETT has, in the latter half of his third volume, gone a great way towards spoiling a really clever novel. There were certainly one or two considerable faults even in the earlier parts, but they were not by any means so great as to swamp its merits. If we had found it needful now and then to skip, yet on the whole we were interested and amused. Everything seemed to be in fair progress for a prosperous ending, when, on a sudden, the author chose to go on a new tack, and to desert the course over which he had hitherto carried us in an easy enough voyage. The harbour was almost in sight, the wind was blowing fair, nothing was needful but to let the ship sail quietly and steadily on, and in no long time master and passengers would have been landed in comfort and harmony. But "lo! a violent cross wind" came and blew us into far different regions. To drop our metaphor—as all wise people do when they have got all out of one that they can, and find themselves, moreover, in danger of getting entangled in it—we passed from a story that was cast in the old humorous type into one that was modelled after the latest school of sentiment and folly. The author apparently was struck with the thought that there is a fashion in writing as in everything else, and that, whatever liberties a man may allow himself for a time, he must in the end submit to the law as it is laid down in the circulating libraries. In the morning every one may wear

\* *Lieutenant Barnabas*. A Novel. By Frank Barrett, Author of "Folly Morrison." 3 vols. London: Richard Bentley & Son. 1881.

as loose a coat as he pleases, in almost any colour, and of almost any cut; but when evening comes on, and the dinner hour is at hand, then we have all to conform to one and the same strict model. So, no doubt, it is with novels. Society will allow of a considerable freedom as the story opens, and even as it is carried on; but in the conclusion there must be no license, and silly sentiment in all its dulness must be allowed to assert its rights. The fair reader, as she closes the book and sends it back to Mudie, will not be defrauded of her sigh or her tear. The hero and heroine, of course, need not be killed, but may be happily married; but there must be at least one melancholy death, just before the wedding, to give a proper relish to the entertainment that the author provides. We are willing to hope that it was much against his will that Mr. Barrett yielded to the requirements of the age, and that in pleasing his readers he by no means pleased himself. He was, indeed, in a position of some perplexity. For, while his hero's half-brother was, in spite of one or two great failings, a virtuous man, his hero's half-brother's half-brother was a most gross and desperate villain. This ruffian would, by a novelist of the old school, have been swung off at Newgate or Tyburn without the slightest feeling of remorse, amid the hearty curses of the mob and to the great satisfaction of the reader. But such an ending would be too vulgar for our more delicate sentiments, and, moreover, it would have been, no doubt, very unpleasant, if not indeed very painful, for the virtuous half-brother. The difficulty is, therefore, got over in a most ingenious manner. The villain could not be allowed to live—that was clear enough—for he was bent on murdering the hero, and had twice already nearly carried out his purpose. His half-brother need not be allowed to live, for he was a good deal in the way, as he had been foolish enough to fall in love with the heroine, who was herself in love with his virtuous half-brother. Besides it would have been very painful for him, as we have said, to remain in a world out of which his wicked half-brother had been swung on a rope. His feelings and ours, too, are spared in the most ingenious manner. The disgust of a public execution and the disgrace of outliving a brother who had died on the scaffold are cleverly evaded by a murder and a suicide. The villain makes a third attempt to murder the hero. The virtuous half-brother, knowing that his half-brother by his mother's side was bent on killing his half-brother by his father's side, knowing moreover that the heroine was not for him, disguises himself in the hero's coat and hat, throws himself into the path of the villain, and gets at once shot by him through the heart. The villain, though he was not touched by the slightest tinge of remorse, happily draws his second pistol, and at once shoots himself through the head. The story, we feel, is brought to an impressive and yet cheerful end—for the villain had begun to bore us greatly—as we read that “he closed his eyes, and put the muzzle of his pistol slowly to his mouth; then with his thumb he pressed the trigger.” The rest is left to the reader's imagination, except in so far as he is assisted by four stars, which have the concluding line all to themselves. Whether they signify the scattering of the villain's brains, or the happy marriage of the surviving half-brother and the heroine after a decent period of mourning, we are at a loss to say.

The scene of the story is laid at the beginning of the century. We cannot allow that Mr. Barrett is very successful in bringing back the age of which he writes. In the year 1800 a gentleman was not likely to flatter his hostess by saying that “the King of France had no better cook than hers”; nor was she likely to mention “the prodigious fortune of the Marquis of Westminster.” The King of France and his cook were in that year things of the past; while the Marquess of Westminster belonged to the future. A gentleman living in Edmonton would not find his letters and the *Times* lying on his breakfast-table when he entered the room, unless, indeed, he breakfasted at an hour when most people were thinking of dining. The West-end road by which the highwayman goes by Hornsey Wood was not made till nearly thirty years after the date of the story. We feel confident that the word “financier” did not eighty years ago bear the meaning that Mr. Barrett gives it when he joins it with “banker.” Not even would a highwayman in that age have so grossly abused our language as to call a thing “reliable.” The hair of heroines, moreover, at that date was raven black. A case or two of auburn locks, perhaps, might be found in a rustic beauty, but “soft gold red hair” was not invented till nearly three-quarters of a century later, while aureoles were as unknown as even the Marquess of Westminster. The ladies do, to be sure, all drink dishes of tea and not cups, but one swallow does not make a summer. Nevertheless, though Mr. Barrett is not very happy in reproducing the age of which he writes, yet, till he comes to his fatal conclusion, the age in which he writes is successfully kept in the background. We feel sure that he has a far stronger taste for the great masters of humorous fiction who were once the glory of our country than for the feeble sentimentalists, with their ridiculous affectations, who are at present its disgrace. Had he carefully kept to the great writers, and never allowed his taste to be corrupted by the bad school of our days, we are confident that he could have produced a story of real power and merit. As it is, there are in *Lieutenant Ernshaw* two or three characters which are drawn with great skill, and more than one scene of a humour which unfortunately is only too rare. The hero, Tom Talbot, and the heroine, who always passes by the name of Lady Betty, are both good in their way—so good, indeed, that, as we close the book, we seriously trust that the four stars, which we have already mentioned, signify their marriage, and not the villain's scattered

brains. The love scenes between them are very prettily managed, and the difficulties which the heroine has for nearly two volumes in convincing herself that she does really love her gallant admirer are described in a way which ought to have a particular charm for all young ladies. Then, too, the mysterious and most alarming disappearance of the hero for nearly the whole of the third volume, if not managed with any great art, ought to be delightfully exciting for all those who do not begin each story by at once turning to see how it ends. In the present case, however, the end, with its four stars, is not made so clear as to spoil the mystery even for the over-curious. The best characters by far are not the hero or the heroine, not even the half-brother who murders, or the half-brother who is murdered, but an old doctor named Blandly and one Toby Slink, a simple country lad, who is tricked by the highwayman into being his squire. Poor Toby begins before long to suspect his master's real trade, but he is so frightened by his threats that he is not unwilling to accept all his statements as gospel. He thus repeats to an Irish pedlar the story which his master had told him:

“Well, there's a rascal who owes him a lot of money, and—and he's looking about for him, and—and—and he don't seem to quite remember the looks of him, and—and—and when he meets anyone all alone, he just looks in his pocket to see if the money belongs to him, and—and if he's in doubt he takes it.”

“I understand the natur' of the master's misfortun' exactly; and what might you do all the time?”

“Why I just stand ready to help master, if needs be; for if we meet the right rascal after all, it's more an' likely he'll try to get away without paying.”

One of his reasons for running away from his home and his old master had been the unkindness of his sweetheart. He managed to steal back to her one evening and to renew his courting. The whole scene is very prettily and humorously told. He began by telling her that she was like the young woman in the printed ballad he had given her last Maidstone Fair, who had led her sweetheart to rob and murder his uncle all for love. “If one day,” he added, “I'm hanged at Tyburn, you'll read your own name in my dying speech and confession.” Mr. Barrett, by the way, is again out in his dates when he more than once makes Tyburn the place of execution in 1800. But to return to our lovers. “You are not a murderer, Toby, are you?” the girl answers. “No; but I won't answer for what may happen. I'm going the road to ruin fast. I don't go to bed at eight o'clock now. . . . Look at me! I'm not what I was—a simple, innocent countryman.” He then reproaches her with not having altered. “Have you lost a single pound since I have been away?” “I can't help it, Toby,” she replied. “I didn't eat anything for a whole day after you went away, but the next morning my appetite was too strong for me.” At last they are reconciled, and he makes her a present of some ornaments, but she wants to know how he had earned the money to buy them. “Give 'em me back, Jenny,” he said, “you shan't wear 'em, dear.” Before long he sends her a token which she need not be ashamed to wear, he says, for “it was bought with my own money honestly, mending the pigsty for Mrs. Smith, the sexton's wife, who is writing this letter for me now.”

In pleasant contrast with this simple countryman is the whimsical, but most tender-hearted, old doctor. So pleasant, indeed, is Dr. Blandly that we can only regret that he lived eighty years ago, and died a bachelor. We should have liked to join him, or some chip of the old block, had there been one, in the fishing-parties to the Lea River, and in the snug little dinners, with the bottle of old Madeira, in the old country-house in Edmonton. We must leave our readers to make his acquaintance themselves, and we can assure them that, in the pleasure he will give them, they will be inclined to overlook the faults, grievous as they are, with which our author brings his story to so weak an ending. We must not, however, follow him in making our last words our worst, but must thank him for a tale which, looked at as a whole, is both amusing and original.

#### FARRAR'S MERCY AND JUDGMENT.\*

IT is not very obvious at first sight why this book has been written. Dr. Farrar published three years ago, under the not very lucid title of *Eternal Hope*, five sermons preached at Westminster Abbey on the subject of future retribution, which were understood by most of his hearers as conveying a denial of the doctrine of eternal punishment, and would have been so understood probably by his readers, but for an explicit and apparently somewhat inconsistent disclaimer of “Universalism.” Dr. Pusey brought out last year “in reply” to this volume, which had attracted an attention due more to the author's position and rhetorical power and the place where the discourses were originally delivered than to its intrinsic weight, a thoughtful and learned work entitled *What is of Faith as to Everlasting Punishment?* And Dr. Farrar now informs us in his prefatory chapter—as he had already stated in letters to the *Guardian*—that while his present work “in form is a reply to Dr. Pusey, in reality my convictions are almost identical with his, except on minor points of history and criticism.” But it is so, why publish it at all? The fact seems to be that Dr. Farrar, among whose many unquestionable gifts that

\* *Mercy and Judgment. A Few Last Words on Christian Eschatology in reference to Dr. Pusey's “What is of Faith?”* By F. W. Farrar, D.D. F.R.S. Macmillan & Co. 1881.

of an accurate and philosophical mind can hardly be reckoned, and who has evidently taken up theological questions *pro re nata* rather than from any special sympathy or familiarity with that branch of study, does not very clearly appreciate either Dr. Pusey's point of view or his own. In spite of his reiterated and unquestionably sincere assertion that he is not a Universalist, he propounds views which to ordinary readers will appear scarcely distinguishable from Universalism. So far as we understand him—and his language gives one the impression of a writer who is swayed more by strong sentiment than definite conviction—he certainly regards Universalism as an open question, and this is a conclusion not identical with Dr. Pusey's, who regards it as a condemned heresy, but directly contrary to it, nor can the opposition be called "a purely verbal" one. We are not of course going to enter here on a discussion as to what is the truth on the solemn subjects in dispute between them, nor is there any occasion for doing so. The question of what is the "orthodox" doctrine, in the sense of the received belief of the Christian Church from the first, is a matter not of opinion but of fact, capable like other facts of critical investigation, and to this test both writers profess to be appealing. Dr. Farrar insists again and again that his "views are in the strictest accordance with all that is required by the Catholic Church," with the teaching of "her four great Councils and authentic creeds and formularies, of writers of all ages who have lived and died in full communion with the Catholic Church" with what has constantly "been taught by Christians within the pale of the Catholic Church." But the force of this appeal to Catholic tradition is seriously weakened by his elsewhere repudiating the notion of making "the truth of any doctrine depend on the decisions of Councils," or of there being any ground why "the ecclesiastics of the sixth century"—or, we presume, of any earlier one—could claim any clearer illumination than those of the nineteenth. Moreover, among "the views of those who have died in full communion with the Catholic Church" are cited the testimonies of Luther, Calvin, and a host of foreign Protestants and English Dissenters of various sects, who can only be included by a definition of "the Catholic Church" which would make it coextensive with the widest pale of nominal Christianity. And the test applied in this vague sense loses all distinctive value. Nor is this all. There is, as we have already intimated, no less vagueness in Dr. Farrar's treatment of the point to be proved than of the criterion to be applied. He begins by assuring us that he has never denied and does not now deny "the eternity of punishment," which it was the object of Dr. Pusey's book to vindicate. But he at once goes on to say that he "understands the word eternity in a sense far higher than can be degraded into the vulgar meaning of endlessness," the point at issue not being whether eternal has not "a higher meaning"—as every one admits it to have in reference to eternal life—but whether it does not in any case include the meaning of endless. When, again, Dr. Farrar says, "I have never even denied, and do not now deny, even the possible endlessness of punishment"—which, however, he calls elsewhere "an immense and startling dogma," not taught but contradicted by Scripture—the words we have italicized show that he is treating as a mere subordinate detail the main issue of the contention between himself and his opponents.

There is the same incoherence in his treatment of the question of Purgatory, which recurs again and again in the volume, and on which he professes to agree with Dr. Pusey, especially as to its involving "a future purification, instead of a state of probation, for those who have not utterly extinguished the grace of God in their hearts." Certainly we had imagined, like Dr. Pusey, that he very strongly insisted in *Eternal Hope*, and in his paper in the *Contemporary Review*, as does Dr. Plumptre, whom he quoted, on a fresh probation after death. He now tells us that "he had scarcely referred to the idea of probation at all, and certainly had laid no stress upon it." Yet so little does he seem even now to realize the radical difference between the notion of a purgatory for those who die imperfect—which has been very generally held in the Church, with many variations as to minor points of detail, and is strongly advocated by Dr. Pusey—and that of a second probation for all who have failed on earth—which is the very view rejected by Dr. Pusey and condemned in the case of Origen—that he habitually confuses or interchanges the two ideas in the course of his volume. In the very next page, *e.g.*, to that from which we have just quoted, he tells us that his views on the point are "substantially the same as those of Dr. Plumptre," though Dr. Plumptre himself is fully aware of the fundamental distinction referred to, for he published in the *Contemporary Review* a long correspondence between Cardinal Newman and himself about it. Elsewhere he speaks of "many a change in Hades before it is easy to distinguish between the best of the evil and the lowest of the good," which can only point, if the words have any meaning, to a second probation in Hades; and yet only two pages before he had again declared that Dr. Pusey's view of "some purification of imperfect souls in the world to come" conceded all he asked. We read, again, that St. Augustine's doctrine of "that terminable retribution, that purgatorial fire beyond the grave, was my main thought in *Eternal Hope*"; but St. Augustine, who was the first to put into definite shape the doctrine of Purgatory as afterwards maintained, condemned the teaching of Origen in the strongest terms. Yet Dr. Farrar speaks in the formal "Statement of his Eschatological Belief," at the end of the volume, of repentance being open to sinners "at least until the Great Judgment in the Intermediate State beyond the grave"; and says, still more explicitly, that "the great separation of souls into two classes will not take place until the final judgment." This is not Augustinian

but Origenist doctrine, and the two, we repeat, are fundamentally different, and involve totally diverse conceptions, ethical as well as dogmatic. We have dwelt thus fully on these contradictions because they not only illustrate the author's vagueness of treatment, to say the least, but illustrate it in connexion with what is an integral portion of the very subject in dispute. It would be equally easy to point out, were there room for doing so, how constantly what Dr. Pusey had shown, and he had himself admitted, to be mere "accretions" of the disputed doctrine, and no part of it, whether true or false, are here mixed up with it in inextricable confusion, as though "the doctrine of endless torment for the vast majority is material flames"—which Dr. Pusey does not defend any more than himself—was the real issue to be decided. While, again, he repudiates both Universalism and Annihilationism, many of the authorities he cites are avowed Universalists or Annihilationists.

Nothing can be further from our purpose than to insinuate any charge of disingenuousness against the author. That his want of precision is largely due to an intellectual habit of mind, better suited to hortatory eloquence than to theological discussion, is more than probable; partly the fault may arise from hasty composition, which will also help to account for the manifold detailed inaccuracies throughout the book. Thus, for instance, in three successive passages John Scotus Erigena is called "the greatest and acutest of all the Schoolmen," and is cited as a very high authority on doctrine. Now, in the first place, Scotus Erigena stands outside of Scholasticism properly so called, and he is so far from being a high doctrinal authority that he was not only notoriously heterodox, but has been very generally charged with pantheism, to the verge of which he approached on the most favourable estimate; even Neander, who defends him, admits that pantheism is the only logical result of his system. The quotation from Bishop Butler's *Analogy*, which is probably borrowed from Dr. Plumptre, and is twice repeated, about the advantageous tendency of virtue "to amend those who are capable of amendment" in the next world, by example or otherwise, is wholly irrelevant, for Butler was expressly speaking, as the context proves, of "other orders of creatures" distinct from man. Still stranger is the citation from Alban Butler's *Lives of the Saints* to prove that "the circumstance of a material fire" in hell is "a mere scholastic question." The statement may be correct enough, but the passage cited has nothing to do with it, for the very sentence before that quoted shows that the author was speaking, not of hell, but of purgatory. It is a still graver mistake, when reference is made to two passages in posthumous works of the late J. S. Mill, to show that in his opinion "every other objection to Christianity sinks into insignificance compared with" the doctrine of endless sufferings in hell. In both passages the whole stress is laid on the predestination of "the great majority of mankind" to those torments, two of the "accretions" which had been inculcated on the elder Mill by his Presbyterian instructors. With similar recklessness Dr. Farrar says, "Dr. Pusey and Mr. Oxenham seem to fancy that the opinion" that the majority will be lost "is in some way connected with Calvinism," and then goes on to insist that "it is centuries older than Calvinism." Of course it is; and neither of the writers mentioned had said anything else. Dr. Pusey merely observes that "it is further aggravated by engraving into it the heresy of Calvin," and Mr. Oxenham that "it has been widely held, both among Catholics and Protestants, though, for reasons," which he proceeds to explain, "chiefly among the latter." These are but a few specimens, culled almost at random, of inaccurate use of authorities, nor would it be difficult to show, from the context or from collations of other kindred passages, that several of Dr. Farrar's patristic citations, borrowed probably at secondhand from Mr. Jukes's *Restitution* or some work of the kind, cannot possibly bear the sense here assigned to them. It is characteristic again of Dr. Farrar's method of argument that, while he dismisses any scriptural phrases found in Fathers or Schoolmen with the remark that "it is not proven" they meant any more than he supposes Scripture to mean, and are therefore "metaphorical" and "indecisive," yet when they interpret the language of Scripture by terms of their own, he equally dismisses their statements, as "unsanctioned by Scripture." In other words, if they adhere to the exact words of Scripture, their statements prove nothing; if they use terms of their own, they have no right to use them, and therefore prove too much. Thus again, when Justin Martyr uses an expression which, by divorcing it from the context, may be twisted into favouring Annihilationism, it is eagerly seized upon; but when he positively insists on future punishment being "endless" (*aidios*), as contrasted with temporary punishment, Dr. Farrar "cannot see that he necessarily meant endless in all its strictness." With similar inconsistency Theodore of Mopsuestia and Diodorus of Tarsus, both of whom were condemned as heretics at the Fifth General Council, are counted "among the best and greatest and most authoritative of the Fathers" when they favour Universalism; but when Tertullian and Minucius Felix and the forgers of the Clementines speak strongly on the other side, we are at once reminded that the first "lapsed into heresy," while the two others "are both heretics and slanderers," and cannot therefore be allowed to have any authority at all. That is very like saying that a heretic with Universalist leanings is thereby purged of his heresy, whilst the faintest suspicion of an heretical taint suffices to put an advocate of the opposite doctrine out of court. Josephus, who asserts emphatically the Jewish belief in eternal punishment, is, with the same ingenious perversity, put aside as "an untrustworthy witness" because he is in the

habit of falsifying Jewish opinions, in order to please his Pagan masters, which only adds further weight to his testimony on a doctrine peculiarly distasteful to the Romans.

It is only fair to acknowledge that, in spite of the defects already noticed, the general tone of this book is more temperate and judicial than that of *Eternal Hope*, and that Dr. Pusey, as a rule, is treated with scrupulous courtesy. Still the author sometimes allows himself, especially towards the close of the volume, when his pen seems to run away with him, in some strange outbreaks of temper. Thus in one place a Scriptural argument, which derives from St. Augustine to Dr. Pusey have usually—and very reasonably—held to be a weighty one, is flung aside as “a stock sophism,” and “a plea ignobly selfish.” Another Scriptural interpretation is contemptuously dismissed with the remark that “the Bible does not lend itself quite so easily to the manipulations of the *odium theologicum*,” as though the *odium antitheologicum* was not in the present day at least equally common. A favourite argument of St. Augustine’s—questionable perhaps but very generally urged—“it is difficult to treat without scorn,” and he is himself “the great repository of arguments on this subject alike doctrinally, morally, and exegetically false.” Nor is Dr. Farrar much more tolerant of the supposed lapses of contemporary authors. One of those already named is charged with making “an assertion which can only be due to the blindest prejudice,” and “is at any rate most astonishingly false”; to us it appears a truism. The views of a second—one of the leading Nonconformist divines and preachers of the day, and a singularly temperate writer—are threatened with “the speedy extinction which awaits wilful error” (the italics are not ours), and here again the incriminated statement appears to us obviously correct. But we have no desire to dwell on blemishes of this kind, which the author himself will probably regret. Into the doctrinal merits of the controversy this is hardly the place to enter. But we must observe that, as regards the appeal both to Jewish and early Christian eschatological belief and the dispute about the case of Origen, which occupy a large portion of Dr. Farrar’s as of Dr. Pusey’s book, the latter writer appears to us to have, in spite of some incidental mistakes, very much the best of the argument. Nor is there anything in the three chapters devoted to Scriptural exegesis, which are perhaps the weakest in the volume, to shake the force of a remark of Dean Goulburn’s, in the preface to his recent volume of *Lectures on Everlasting Punishment*, “that the real objections to the doctrine lie deeper than any Scriptural texts, and that, were only Scripture itself in question, no doctrine but the old-fashioned orthodox one would have ever found acceptance.” It is difficult to resist the impression that Dr. Farrar has again and again, however unconsciously, read his own meaning into Scripture rather than found it there. That this is notably the case as regards his very perfunctory treatment of the critical word *αἰώνος* might be inferred from the fact that so distinguished a Greek scholar as the late Rev. James Riddell of Balliol has shown, in a note extracted by Dr. Pusey, that even in classical authors “*αἰών* had very early the sense of unlimited duration, and further that, in proportion as, in the hands of philosophers, this conception was more and more consciously dwelt upon, *αἰών* had this sense more and more precisely fixed upon it.” His inadequate appreciation of the force and extent of the Scriptural argument is sufficiently evidenced by the author’s assertion that the texts urged in support of the received doctrine “are few in number,” and by his way of confining his argument to these few texts, ignoring many others, and also ignoring what has been urged on the other side from the cumulative force of Scripture teaching as a whole. He seems also to have very imperfectly apprehended the ethical bearing of the argument. Such considerations must not of course be pressed beyond their due limits, but still great weight must attach to such a judgment as that pronounced by the late Professor Mozley, who was one of the last men to be dominated by imagination or passion or prejudice or mere routine orthodoxy, and who was not at all unconscious of the difficulties of the subject. Yet he has left on record his deliberate conviction that “the release from the notion of eternal punishment would be felt by the great mass as a release from the sense of moral obligation, and relying on the certainty that all would be sure to be right at last, men would run the risk of intermediate punishment, whatever it might be, and plunge into self-indulgence without hesitation.” He adds still more strongly that “a general relaxation of moral ties, a proclamation of liberty and security, the audacity of sins which had before been abashed, carelessness where there had been hesitation, obstinacy where there had been faltering, and defiance where there had been fear, would show a world in which the sanctions of morality and religion had been loosened, and in which vice had lost a controlling power, and got rid of an antagonist and a memento.” Such considerations should, at least, have their weight with a writer whose real antipathy to the received doctrine is based far more on its alleged “danger,” as revolting and abhorrent to the moral sense, than on Scriptural or traditional difficulties, though he, of course, does his best to enlist the sanction of Scripture and Tradition on his side, and is fully persuaded of his success. Dr. Farrar is always a picturesque and interesting writer, and his manifest sincerity cannot fail to conciliate sympathy, but he appears to us to do himself least justice when he essays theological discussion, for which neither his antecedents nor intellectual bent give him any peculiar aptitude.

#### NOS AUTEURS DRAMATIQUES.\*

M. ZOLA has long been very ill satisfied with the present condition of French dramatic literature, and he has also for long been giving emphatic utterance to his dissatisfaction in the columns of the *Voltaire* and the *Bien Public* in the form of critical articles. If the amount of anger caused by criticism is any test of its value, M. Zola is entitled to be gratified by the testimony borne to his own; for, though we may hesitate about accepting his estimate of the effect he has produced, there can be no doubt that he has succeeded in making a great many gentlemen very angry. According to M. Zola himself, the main, if not the only, occupation of the literary world of Paris has for some time been the answering of these articles and the calumniating of their author. He has held the honourable, though painful, position of the prophet of *naturalisme*, rejected with violence by a vain people. The facts are probably somewhat short of this; but, none the less, many of his contemporaries have agreeably flattered his not inconsiderable sense of his own importance by showing themselves severely hurt by his strictures. The effect produced by his articles may be attributed to other causes than the force of his criticism. A writer who disposes of M. Victor Hugo by bawling at him “Bourgeois! bourgeois! bourgeois” may be trusted to cause a smart shock to most Frenchmen of delicate nerves, which will not be soothed by the condescending praise of other passages, or by such a summing up as this:—

La représentation de Notre Dame de Paris m’a, en somme, confirmé dans mon opinion que le théâtre de Bouchardy vaut le théâtre de Victor Hugo. Il n’y a qu’une différence de style. Quand le poète écrit lui-même Ruy Blas, il rime un chef-d’œuvre de poésie lyrique. Quand il laisse coudre de sa prose dans Notre Dame de Paris, il obtient un mélodrame des plus médiocres.

Loud critical pretensions on the part of a writer who classes together, for the purpose of judging a dramatist, an original play, and an adaptation to the stage by somebody else of one of the dramatist’s romances, must have been found, we can well believe, singularly irritating. Of the rest of M. Zola’s critiques of Victor Hugo—as we do not propose to refer to them again—we need only say that it includes a charge of literary dishonesty. How the writer deals with lesser men may be judged from his treatment of the acknowledged chief of French literature. He recognizes a certain merit in MM. de Goncourt, and even great merit in the fine naturalism of Erckmann-Chatrian’s copious eating and drinking which make the dramatic action of *L’Ami Fritz*; to M. Théodore de Banville he condescends as a very big dog might to a very small and amusing puppy; but, as a rule, his tone towards contemporary dramatists is accurately described in the following words from his own preface:—“Une légende veut que je me sois montré à leur égard d’une brutalité de sauvage, rongé de jalousie, sans la moindre idée critique qu’une envie basse de tout détruire.” What M. Zola’s motives may be we shall not presume to decide; and indeed we believe him sufficiently well satisfied with himself to deserve acquittal from the charge of jealousy; but how far he deserves the charge of underbred insolence in his tone towards his contemporaries our readers can judge from the following quotation, taken from the chapter devoted to M. Victorien Sardou:—

Il n’y a actuellement que deux situations possibles pour un auteur dramatique: tout sacrifier au succès, dégringoler jusqu’en bas la pente du médiocre et se consoler en ramassant des bravos et des pièces de cent sous; ou bien vouloir tenter la littérature sur les planches, tâcher de mettre debout des personnages en chair et en os et risquer alors les plus abominables chutes qu’on puisse rêver. M. Sardou, par tempérament sans doute, a choisi le chemin bordé de fleurs. C’est tant pis pour lui. A mesure qu’il avance le public lui demande des farces plus grosses. “Allons, plus bas! plus bas! agenouille-toi davantage! plus bas encore! dans le ruisseau! C’est notre bon plaisir; nous aimons les gens que nous salissons.” Et il ne peut se relever dans l’orgueil de son génie libre et indompté, car c’est lui-même qui s’est mis à genoux le premier pour montrer ses plus jolis tours.

M. Zola is quite as merciless towards the critics. They are, he is never tired of saying, a race of imbecile persons oppressed by conventionality. They “pataugent” (our author is very much in love with the verb *patauger*) “là devant avec des cris de volailles effarouchées.” They would dearly like to say that Molière could not write a play and that Racine is dull, if they only dared. In their dealings with the modern stage their one object is to crush everything that has the slightest originality—an accusation which, he seems to think, has never been brought against critics before. The whole is seasoned with loud-mouthed expressions of contempt and personalities of the kind likely to commend themselves to a writer who believes that the workman of the outer boulevards challenging another to the fray is a “true hero of Homer.” This sudden intrusion of the *savate* into the rapier practice of French literary warfare must have been disconcerting, and sufficiently accounts for what success M. Zola has had in causing pain and annoyance.

We have dwelt at length on M. Zola’s tone towards his contemporaries, because we believe that his critical method owes all the originality it possesses to this “brutalité de sauvage.” Putting that aside, there is nothing in his book with which we are not already perfectly familiar. That the characters of a play had better be original, and must be true to their surroundings and consistent with themselves; that the plot should be coherent and the

\* Nos Auteurs dramatiques. Emile Zola. Paris: G. Charpentier. 1881.

climax produced by the most simple and natural means possible, are the truisms on which M. Zola clamorously insists, as if they had not been the commonplaces of criticism from the beginning of time. Their virtue is in the application. Now M. Zola's way of applying them is to make one or other the one thing necessary, according as he wishes to praise or blame. *Les maitres* are lavishly praised, with the generosity it is so easy to show to men who are no longer rivals. The moderns are rebuked for not doing what it was right in the men of Lewis XIV.'s time to neglect. Blots which have been perfectly obvious to everybody are pointed out with a great parade of original acumen and a plentiful seasoning of terms of contempt. And withal M. Zola cuts the ground from beneath his feet by denying that there are any general laws governing dramatic literature. They vary completely, according to him, with every generation. It was a mistake to reprint these articles. Literary mud-throwing is an effective way of attracting notice, but it depends on its suddenness for most of its effect. In an isolated article a good loud personality covers many critical sins; but in a collection want of coherence in the ideas is apt to become painfully obvious. Of course, M. Zola, who, as we know, on his own authority, is a scientific writer, has judged his contemporaries "en homme de méthode," as we learn from the same competent witness. Only unfortunately, when we have come to the end of his survey, we find the method still to seek. He supplies us with a literary confession of faith which resolves itself into his favourite formula, that we must look at man as he is; but, when he himself sets to work to show how this is to be done in the theatre, this test of the truth of all literature seems to be very uncertain in its working. He finds the *Misanthropes* and *Les Horaces* very admirable in their analysis of character, and still more for their contempt of stage effect. The second half of his praise does not seem very consistent with his admiration of Molière's skill in constructing and developing a play. He makes no attempt to reconcile the first with his theory that *naturalisme*—the vulgar copying of life, and any sort of life—is the one end of literature. On the contrary, he fiercely defends Corneille against an imaginary critic for not making *Les Horaces* like any world except the poetic one of tragedy. To be sure, when M. Zola is not using the works of *les maitres* as missile weapons against M. Sardou, his opinion undergoes a convenient change. He finds the characters of Shakespeare and of M. Victor Hugo, whom he apparently classes together as dramatists, not enough like life. He is arguing here, with exceptional courtesy, against M. Théodore de Banville in favour of his great principle, the necessity of scientific accuracy in the literary representation of the world. The utter want of any sign of this in their personages annoys him, and he is of opinion that they lose by it. Compare them—at least compare "les matamores d'Hugo" with "César Birotteau, ce gigantesque lutteur," and see how mean they look in comparison, says M. Zola. It is, of course, necessary to M. Zola's literary theories that Balzac should be accepted as having drawn life with a vulgar accuracy, and how enormous a supposition that is we need not say; but we might at least expect him to have some understanding of the characters of the writer whom he clamorously proclaims as his master. The epithet of gigantic as applied to poor César Birotteau, who mistook the wild dance of impracticable schemes in his brain for "la substantielle action du talent," may cause some doubt as to the value of M. Zola's praise, endless and noisy as it is, of *La Comédie humaine*. As we are on the subject of M. Zola's adoration of Balzac, we cannot avoid making the pedantic criticism that, however he may be inspired by the master's spirit, he does not appear to have much knowledge of the details of his work. Having occasion to rebuke M. Octave Feuillet for his certainly excessive fondness for introducing duels, he ventures the statement that there is but one in the masterpieces of Balzac. Of course M. Zola may have an esoteric interpretation of the word masterpiece; but it would certainly appear from this that he has never read either *Le Père Goriot*, *Un grand Homme de Province à Paris*, nor *La Peau de Chagrin*. He observed that M. Zola has already put Molière and Shakespeare side by side; and as he classes Victor Hugo with Shakespeare and Bouchardy with M. Victor Hugo, we get, on the principle that things equal to the same thing are equal to one another, a very curious classification. Corneille, Molière, Shakespeare, Victor Hugo, and Bouchardy, that is how M. Zola's critical faculty ranks the masters of dramatic literature.

What is the naturalism that M. Zola seeks and does not find on the theatre? His pompous phrases about scientific accuracy and "le document humain" throw no light on the question, being, like the schemes of César Birotteau, a mere movement *in vacuo*. The nearest approach to a clear definition is, we believe, to be found in his criticism of M. Emile Augier. He gives a qualified admiration to *Les Femmes d'Alger*, but reproaches the author for his want of courage in not pushing it to the extreme development of which it was capable. Why mask the figure of Séraphine behind Térèse? Why, having had the opportunity to be so utterly foul, keep within even wide bounds of decency? Our stage, says M. Zola, *meurt d'honnêteté*, is dying of mere decency. We will not give human beastliness its fair share—that is, much the larger part—of our literature. This criticism, repeated on many other pieces, contains the real creed of the naturalist school. Life for them means the diseases and the corruptions by which life is ultimately destroyed.

## CANONICITY.\*

IT would be interesting to learn what reasons moved Dr. Charteris to select the word "Canonicity" as the title for an expanded and amended edition of Kirchhofer's *Quellensammlung*. The word is scarcely Protestant, it is certainly not Presbyterian. All orthodox Presbyterians, Independents, Baptists, Wesleyans, and Plymouth Brethren agree in their uninquiring adoption of the traditional and ecclesiastical "canon" of Holy Scriptures as final and authoritative; but we cannot help thinking that the words "canon," "canonicity," and "canonical" must grate upon their ears and come hesitatingly from their pens. The Swiss Professor, to whom Dr. Charteris and many others are so largely indebted, simply called his book "A Collection of Sources for the History of the Canon." He was too exact a thinker not to perceive that a *Canon*, in its historical meaning, and a *Sammlung*, as he employed that word, are in no sense equivalent expressions. The founders and early legislators of Presbyterianism carefully abstained from taking upon themselves the dangerous responsibility of using the phrase "canonical" in their dogmatic definitions concerning the authority of Holy Scripture. Dr. Charteris has included amongst his other additions to Kirchhofer a collection of extracts from authoritative documents of the last three centuries—Orthodox Eastern, Tridentine, Old Catholic, Lutheran, and Reformed. He locates the Church of England—after the absurd fashion universally current amongst German theologians until recent years—amongst the subdivisions of an ecclesiastical solidarity called "the Reformed Church." Such an ecclesiastical solidarity never existed outside the brains of Presbyterian theorists, though the Scottish and English Presbyterians, during the session of the Westminster Assembly, strove hard to compel the English Parliament to make this theory the basis of its ecclesiastical legislation. The non-Roman part of Western Christendom, according to this theory, is divided into two Churches—the Lutheran and the Reformed or Calvinistic; and the ancient national Church of England is nothing more than one of the subdivisions of the *Reformirte Kirche*. The theory is always confirmed and illustrated in German text-books by a comparative presentation of the *Confessio Helvetica* I. and II., *Confessio Gallicana* (Huguenot), *Confessio Bohemica*, the Scottish Confessions of Knox and of the Westminster Divines, and many others, with the *Confessio Anglicana*, meaning by the latter the Thirty-nine Articles of Religion. It is evident from Pardovan's collections (Book I. Tit. xviii.) that the Scottish Presbyterians, both in the sixteenth and seventeenth centuries, had an ambitious dream of Scotticizing the whole of Western Christendom, or at least of non-Roman Christendom, by persuading "the Protestant Princes and Commonwealths" to convoke "an Universal Assembly of the Church of Christ in the world, which was commonly called an Ecumenic Council." All "National and General Assemblies and Convocations" were to be represented at it. Every independent sovereignty in Europe, though it included less than fifty parishes, was to send "at least a representative of the Church therein by one pastor and ruling elder." It was assumed that the Presbyterianism of Scotland was the *jure divino* ideal toward which all other Reformed Churches were feeling their way, and "there being an universal harmony in all the Confessions of the Reformed Churches, the work of a General Council as to matters of faith would in all probability be sweet and easy." It was probably intended that when Pan-Presbyterianism of the Scottish type had spoken once and for all ecumenically, "the magistracy" should be urged to place its sword at the service of "the ministry." The Scottish Presbyterians, as Robert Kaillie's letters show, put great faith in the sword. They relied on the Princes and Commonwealths to make short work with Papists, Lutherans, Anglicans, Independents, Anabaptists, Quakers, and all other gainsayers contrary to "the best Reformed Churches." The word "canonical" was used by the Swiss (of semi-Lutheran Basel) in 1537, by the Scots in 1560, by the Swiss (of Zwinglian Zürich) in 1566, and by the French (at La Rochelle) in 1571. We read in "Reformed" formularies of "Scriptura canonica," of "ces livres canoniques," and of "those books which are the ancient and have been reputed canonical." But when we turn from these "Reformed" confessions to the Thirty-nine Articles, we find a most notable difference of language. The Anglican Article VI. grounds the acknowledgment of the "canonicity" of the books named in it upon the tradition, the consciousness, and the living witness of the historical Catholic Church. "In the name of the Holy Scripture we do understand those Canonical Books of the Old and New Testament of whose authority was never any doubt in the Church." It is worthy of observation that the careful and systematic Winer, in his *Comparative Darstellung*, though he cites portions of Articles VI., XIX., and XXI. in order to prove his foregone conclusion that the Anglican branch of the *Reformirte Kirche* agrees in its doctrine on Holy Scripture with all the other branches of that imaginary entity, actually omits these important words. The citation would have spoilt his theory. The sentence in the Latin—"eos canonicos libros V. et N. Testamenti, de quorum autoritate in Ecclesia nunquam dubitatum est"—occurs word for word in the *Confessio Württembergica*; and it happens that this confession was drawn up by the Lutheran

\* Canonicity: a Collection of early Testimonies to the Canonical Books of the New Testament, based on Kirchhofer's "Quellensammlung". By A. H. Charteris, D.D., Professor of Biblical Criticism in the University of Edinburgh, and one of Her Majesty's Chaplains. Edinburgh: Blackwood & Sons. 1880.

Brenz and the Swabian theologians, and received the specific approbation of the Lutheran theologians in Saxony, including Melancthon. This fact smashes to pieces the hypothesis that the Thirty-nine Articles and the Westminster Confession may be bracketed together as documents of an imaginary universal Calvinistic "Reformed," or anti-Lutheran, Church. The old Scottish "Confession of our Faith, ratified and approved by the Estates in this present Parliament" (1560), uses a very different language. In that document "the inhabitants of the Realme of Scotland, professors of Christ Jesus," after declaring the authority of the Scriptures "to be of God, and nether to depend on men nor angels," go on to say, "We affirme, therefore, that sike as allege the Scripture to have na other authoritie but that quhilk it hes received from the Kirk to be blasphemous against God, and injurious to the trew Kirk." We need scarcely say that neither Papists, Lutherans, nor Anglicans in any formulary have made any such allegation as the "trow Kirk" inferentially charges upon them. The later "Pan-Presbyterian" document, the Scottish-English Confession of the Westminster Assembly of Divines—composed when Puritanism, by the power of the sword and secular law, seemed about to realize a part of its ambitious dreams—begs the question of canonicity, while it scrupulously avoids the use of any such uncanny word. The Westminster Confession had in England a secular side. It was professedly a revision of the English Thirty-nine Articles, which the Parliament had handed over to "the divines" for correction and improvement. "The authority of Holy Scripture," said these authentic fathers and doctors of the Presbyterian Churches, "for which it ought to be believed and obeyed, dependeth not upon the testimony of any man or Church, but wholly upon God (Who is truth itself), the author thereof; and therefore it is to be received, because it is the Word of God. We may be moved and induced by the testimony of the Church to an high and reverend esteem of the Holy Scripture." We can imagine Selden or Lightfoot, or some other of the few critics and scholars in that solemn assembly, quietly observing, *sotto voce*, "So we are to believe that it is the Word of God because the Scottish Commissioners tell us that it is; for the Ecclesia of the Anglican Article VI. we are to substitute Knox, Baillie, Calamy, Nye, Marshall, and our contemporary Scottish and English Presbyterians." Of its authority "there was never any doubt in the (Presbyterian) Church," and the ground of their freedom from doubt—their "Canon," in fact—is stated in the words, "It doth abundantly evidence itself to be the Word of God."

How did these particular books, excluding others in some points similar to them, and sometimes treated as parts of the same whole, first acquire the title and the quality of "canonical"? What is meant by the "Canon," as applied to the recognized books of the Old and New Testaments? What authority presided, what principle of selection guided, during the building up of the Bible as we now have it, and as the Presbyterians accept it? Why were these particular books accepted, and why were other books rejected, in the process of constructing that whole which Dr. Charteris names "Canonicity"? These questions have been answered by Credner, Bleek, Oehler, Woldemar, Schmidt, Schenkel, Dr. Westcott, and many others in widely varying ways. But Dr. Charteris has not attempted any answer whatever; though, after the completion of his work, he seems to have been struck by the oddity that he should have compiled a book of 500 pages and called it *Canonicity*, without anywhere telling us what "canonicity" means. We presume that a remark in his preface is due to his late perception of this extraordinary omission. "It was originally intended," he says, "to have a chapter on the avowed grounds of the reception of the Canon in Christendom, especially since the Reformation." The authenticity of Scripture must be determined either by an objective or a subjective standard, or canon. A man may believe the Epistle to the Romans, or any other book of Holy Scripture, to be a part of the authentic Word of God, because the Church, or the entire Christian society, has always and everywhere believed it to be so, which is the "canon" implied in the Sixth Article. Or a man may believe a book to be part of God's Word because it evidences itself as such to him—because, as Coleridge puts it, it has a power of "finding us," or, as Luther put it at various times, because it "preaches Christ," or is "worthy of apostolical dignity." The testimony of the Church and the testimony of individual consciousness may of course concur; but it is impossible to derive any fixed and universal conception of canonicity from the latter alone. The "canon" for all Christendom cannot be set up by any one individual Christian. Dr. Charteris, however, is singularly loose in his employment of the phrase. He uses it when "authenticity," or "divine inspiration," or some other term, would be far more descriptive of his meaning. Thus, speaking of the Epistle to the Hebrews (p. 272), he observes, "The chief interest in this epistle attaches to the history of opinions on its canonicity." He here uses the word "canonicity" as a mere synonym for authorship or for apostolicity, or for authority on a level with that of the Epistle to the Romans. He fails to see that there can never again be any doubt as to the "canonicity" of this Epistle. It was at one time canonical in some churches while not yet canonical in others; but now every Church in Christendom has long accepted it as "canonical." It has been put into the "canon," and there it stands, and, as we suppose, ever will stand. No question, therefore, can be raised as to its "canonicity"; all that can now be asked is whether it obtained that canonicity on sufficient or (as Professor Overbeck of Basel has just asserted) on insufficient grounds. A modern Presbyterian would do wisely

to follow the prudent example of John Knox and the divines of the Westminster Assembly by not committing himself to the use of these dangerous words, unless he can show that "canon" means nothing more than a catalogue of selected books. But even this conclusion would have appalled Knox and the Presbyterian reformers, who, as Professor Given of Magee College tells us in his new book on the Canon, "set Canonical Scripture above the Church." Another eminent Presbyterian, Dr. Cunningham, determined that "canonicity" means "apostolic authorship." Dr. Given, perceiving that this theory does not "meet all the requirements of the (Presbyterian) case," substitutes for it "inspired authorship," and declares this to be "the main constituent in canonicity." Thus they go round and round in a censeless circle. For who decided which authors were and were not inspired? Who settled what books should be included in the select catalogue?

The materials which Dr. Charteris has brought together make up a very useful and much wanted work. Kirchhofer's book, published nearly forty years ago, is now very scarce. On comparing the two works together, we find that Dr. Charteris has omitted the parallel columns of Latin translation which Kirchhofer so diligently placed side by side with his Greek excerpts. Kirchhofer's quotations have been most carefully verified and corrected by the use of later and better texts. But, after conceding to the reviser all that is due to him—and much is due—we cannot regard Dr. Charteris as a substitute for Kirchhofer. The Scotchman has omitted much that is valuable in the Switzer's work. Dr. Charteris tells us in his preface that Kirchhofer was greatly indebted to Lardner; but he omits to tell us (what Kirchhofer relates in his own modest "Vorwort"), with what diligent labour the Swiss Professor verified every sentence which he quoted. Whenever he cited a passage from any Father, he read through the whole treatise or writing in which it occurred, and he made a point of writing out the excerpts from the original, even when he found them in Lardner or Orrelli. In many cases we find that the notes of Dr. Charteris are mere translations, abbreviations, or paraphrases of Kirchhofer's notes. A reader who has not the German book at hand may easily attribute to Dr. Charteris a great deal which is not properly his own. This assertion may readily be proved by a comparison of Charteris and Kirchhofer on some particular section. Thus, in the section on the Epistle to the Hebrews, Tertullian and Cuius are cited, and each citation is followed by a critical remark, which the reader will naturally attribute to Dr. Charteris, although it is freely borrowed from Kirchhofer, while no other reparation is made to him beyond the faint confession in the title-page and the preface. In the citation of Hippolytus, in the same section, Dr. Charteris was of course able to avail himself of help which was not open to Kirchhofer. In the citation of Dionysius of Alexandria, Dr. Charteris is very thin and generalizing, while Kirchhofer is full and elucidatory. Sometimes Dr. Charteris has curiously failed to avail himself of the good matter with which Kirchhofer has provided him. Thus, in the section on the Catholic Epistles, the author of *Canonicity* makes the jejune remark that "the origin and meaning of the term *Catholic* are obscure," although he had Kirchhofer's clear elucidation before his eyes. He must have seen it, for in the remainder of the same note he adopts Kirchhofer's citation of Clement of Rome and of Photius on Clement of Alexandria. The contrast betwixt the two is perhaps nowhere more striking, to the advantage of the Switzer, than in the poor notes of Dr. Charteris and the full, pithy, and suggestive notes of Kirchhofer upon the Shepherd of Hermas, in the section upon the Apocalypse, and in their notes upon the citations from Irenæus in the same section.

#### COLONEL PLAYFAIR'S MEDITERRANEAN.\*

THERE is something very pleasant during the inclemencies of an English summer in reading of the sunny regions which surround the great inland sea. Colonel Playfair's Handbook comes to us like the "beaker full of the warm South" for which poor perishing Keats longed. Just as the poverty-stricken bibliomaniac delights to read the catalogues of sales he cannot afford to attend, so when east winds blow and the showers fall, and the August fire blazes on the hearth, there is a sad sort of comfort in calculating the expenses of "a 150-ton schooner yacht," learning that it is well and sufficiently manned with a captain, mate, six seamen, cook, and cook-boy, and that a cruise of eight months may be managed for some 1,600*l.*; or of going through the list of the isles of Greece, and joining an imaginary shooting party on the Albanian hills; or of laying out seven days' excursions in the bay of Naples. The fascinations of a guide-book to stay-at-home travellers are, of course, all the greater when the book relates to out-of-the-way places, and when the information is pleasantly conveyed. Colonel Playfair seems equally at home in Constantinople and Tunis, in Ephesus and Oreete, in Jaffa and Dalmatia. He tells us impartially about the great places and the small ones; about those engaging little islands which surround Libya; about the interior of Cyprus, about Oran and Scio. That one man should in the compass of an ordinary lifetime have visited all the places described seems impossible; but if Colonel Playfair writes in part from hearsay, it does not in the least diminish the value of his work. The north coast of Africa is of course most familiar to a consul at Algiers; but the account of it is not disproportionately

\* *Handbook to the Mediterranean.* By Lieutenant-Colonel R. Playfair. London: John Murray. 1881.

long. The chapter on Malta is the first satisfactory description of that most interesting island which we have met with in any guide-book. The Suez Canal is not in the Mediterranean, but the history of the undertaking is not out of place *à propos* to Port Said. Grenada is now so easily visited from Malaga that the book would have been incomplete without some notice of it, though it lies a long way from the coast. The guide, in short, is chiefly intended for people who go down to the sea in yachts, and so far as can be seen without actual yachting experience of it, is admirably adapted to fulfil its purpose. It is fully furnished with maps and plans, and has charts of ports showing the depth of water, as well as a chapter devoted to an account of the safe anchorages in the Mediterranean.
